First I am going to report a bit of conversation with Gordon Waldron, attorney for the United Farmers of Ontario. The U. F. O., as the organization is usually referred to, is a dominating factor in Ontario politics at this moment. They cannot win by a clear majority, but owing to a three cornered political situation the U. F. O. minority is practically in control or is the "government." As a matter of fact it is a four cornered situation, for, in addition to the U. F. O., there is a liberal, a conservative and a labor party. In other words, it controls by a plurality rather than a majority. But this control is sufficient that if the U. F. O. were fully united it might soon reverse the action of the former parliament. But there again the necessities of the people of the province step in and prevent any serious attack on the hydro commission which has served well. Some, of course, still maintain it has served too well in that it has been ambitious to meet the needs of the province and in the few years it has been in existence it has created a property approximately valued at $200,000,000. The point was often raised that the ambition of the commission—or rather, of, as Mr. Waldron termed Sir Adam Beck, the head of the commission, "this chap"—had led into the error of building too big at Queenston. The Queenston plant, photograph of which appears on the cover, had its inception as a war measure. Manufacturing had increased in the province so that there was insufficient hydro to meet the needs. Purchases were made outside and the Queenston plant started. It was thought it might cost under a score of millions, but war prices, great increase in its power possibilities and the excavation of solid rock from the canal to the extent of four million cubic yards have increased the cost of the plant until it will mount to a figure possibly several times the first estimate. I heard no complaint that any portion of this increase of cost was due to jobbery or dishonesty on the part of the commission. The necessities of the province for fullest development of its hydro-electric power may be appreciated when it is understood that every ounce of coal used in the province has to be sent from the Pacific Coast or from extreme Eastern Canada, or, as is usually the case, imported across the border of the states. Its cost now is around $15 per ton.

But to return to Dundas, Preston, and other beautiful little communities and the valleys west of Hamilton and approximately a hundred miles from Niagara where the power is generated. The first little town a dozen miles out of Hamilton is Dundas. The current is received here for many of the smaller communities to the Westward. Transformers "step down" the voltage and it is distributed to the other districts. One of the first farmers interviewed was J. R. Wood of Preston, Waterloo County. He is using a five horsepower motor, has installed 45 lights in barn and house; his wife has the use of electric irons, washing machine, toaster and water under pressure. Mr. and Mrs. Wood expressed entire satisfaction with the service and would not have it discontinued. It is costing $7 per month. I may say here that rural service was entirely unknown in the province of Ontario until the installations made by the hydro commission. Therefore a new life, almost a new world, has been brought into the rural home. Mr. Wood's service includes the five horsepower motor which handles a "chopper," as the Canadians usually term the grain grinder, and other appliances in the barns. Ephram Kinsie was not at home but pump house and farm creamery were inspected. His electric power is costing him slightly more than the oil engine formerly cost, but rendering vastly more efficient service. Lewis Hagey of Preston: "Wonderful convenience, saves in cash formerly paid to help, minimum cost $5.56." Mr. Hagey said first connection made with his power was on the grindstone. Has installed range, washing machine, separator, chopper, etc. Power is not sufficient for silage cutter. Simon Kinsie at Breslau has the greatest comfort in the use of the power to pump his water. His well was deep, the lift was great and the pumping was a back breaking proposition for the women of the house. With his grain grinder he "chops" 2,000 bushels per year. Minimum cost $7.40 each month.

Minimum cost at first was much less than this and Mr. Kinsie, and in fact all the men formerly interviewed, referred to the abnormal increase in the rates in this one district. For explanation they gave the following facts. The district covering portions of some three or four townships was not as thickly settled as some of the districts organized. The rule of the commission is that there must be at least three installations for every mile of line constructed. The commission has been empowered to join in the cost of line installation in order to induce greater rural use of hydro. This was done in the case of these townships, the money being secured from hydro rentals. It has been a principle of the commission that every district shall carry its own "cost." Hence the city or district 100 or 200 miles from point of generation must bear higher "cost" hence higher rates. In signing up contracts for the district near Preston, Breslau and other nearby towns two factories being installed were included in the district in order to make up the required three installations per mile. After comparatively short life these factories both ceased operations and their contracts were voided, thus throwing the entire "cost" and minimum charge made by the commission to the district on the few small farms. It appealed to me that wise action would have dictated a profit and loss fund account from which emergencies of this kind could have been met.

However, the commission is assuring consumers that relief is in sight and that lower rates will soon be given producers in this district.

The twin cities of Kitchener and Waterloo, amongst the best lighted of all in the province, were passed and we inspected on the farm of James Snyder, root pulper, chopper, pump and other installations including silage cutter. Mr. Snyder is a member of a "syndicate" which enables the members to contract for a 20 horsepower installation. Syndicating is necessary for the reason that if five individual farmers contract for 25 horsepower each installation their demands may be for the current at the same moment. This would call for a greater k. w. h. than could be delivered without proper assignment of time. One of the greatest problems for the engineers has been the providing for usage which will not bunch too great a load at one time with greatly reduced demand an hour later. So the five member syndicate enables the farmers to install 20 horsepower motor and in this way they are permitted to install threshing machines, silage cutters and other machines requiring greater power.

One of the housewives whom I met during a day's drive expressed greatest appreciation of the comforts it has brought to her home. I asked if on account of the higher price, she would think it best to discontinue the service, and she replied very quickly, "Indeed, sir, I hope not, for this service has shown us how unfortunately we were situated before." Asking similarly of a farmer he was quick to come back with: "No indeed. My grandfather settled on these lands, lifted the stumps and made fences of them, my father came and built a bigger and better barn and I have inherited many comforts because of their pioneering work. I feel now that organized as the hydro commission is it is enabling me to join my neighbors in creating a great heritage which shall add to the comforts of our children. Without this opportunity I would simply be passing to my children what my father left to me. The heritage is great and must be preserved to our children."

The people of Ontario, almost to a man so far as I could learn in several days of intercourse with them, take great pride and have a thoroughly patriotic spirit in the matter of hydro development. The spirit is spreading to the other provinces of Canada, and ownership by the people is increasing as never before. This has resulted in Canada developing more per capita, or rather, more per thousand of the population of H. P. installations. In 1920 Canada had installed 280 H. P. for each 1,000 population; the United States, 93 per thousand. Bear in mind this was in 1920 and presumably the installation in the United States has vastly increased in the last year and a half. As California is the leader in the United States, presumably this one state can make a far greater showing today than does Canada. In securing these great properties aggregating approximately $200,000,000 there has been no condemning or expropriating. The acquiring of already installed properties has been done by purchase of stock or through agreement with stockholders.

---

Queer how a man's better half is always looking for his worst side.

# *The* IDEAL FAMILY CAR

THE wonderful dependability of the Overland Sedan makes it the ideal car for the American farm.

Every riding and driving convenience is yours in this beautiful car. It comes completely equipped with electric starter, lights, battery, demountable rims and regular three-speed transmission.

Triplex Springs swing you over the rutted road or smooth macadam in a riding comfort equalled only by cars of longer wheelbase and much higher price.

The 27-brake horsepower motor carries you more miles at less cost than any other car. Owners average 25 miles and more to a gallon, and repair costs are surprisingly low.

You cannot afford to buy another car before you see the Overland Sedan.

### THE BENEFICIAL TOAD

A. H. Kirkland of the United States department of agriculture states that 149 stomachs of toads examined during the months of April, May, June, July, August and September showed 19 per cent of ants, 16 per cent of cutworms, 10 per cent of thousand legged worms, nine per cent of tent caterpillars, eight per cent of ground beetles and other close allies, six per cent of May beetles and allies, five per cent of wire worm beetles and allies, five per cent of destructive weevils, three per cent of miscellaneous caterpillars, three per cent of grasshoppers and crickets, two per cent of spiders, two per cent of sow bugs, one per cent of potato beetles, one per cent of carrion or burying beetles, one per cent of miscellaneous beetles, one per cent of snails, one per cent of angle worms, one per cent of vegetable matter and gravel probably taken in with the insects, and five per cent of unidentified animal matter.

In considering the value of the toad as shown by this work, we must remember that ants, while not directly injurious to the agriculturist, are a pest to the housekeeper, sometimes injure lawns, and always encourage by their assiduous devotion and attention destructive plant lice. The toad makes a fine showing in the above percentages on cutworms. The thousand legged worms eat into fruit when off the tree; the injurious qualities of the tent caterpillar we are well aware of, and we also know that but one or two birds will touch them on account of their disagreeable covering of hairs. Ground beetles are, for the most part, beneficial, but May beetles or June bugs, as they are sometimes called, of which the above toads ate six per cent as compared with the rest of their food, we all know are most destructive upon lawns, strawberry patches and elsewhere. The wire worm beetles are the source of one of our most destructive pests both in the garden and on the farm. All weevils are exceedingly injurious, and the rest of the list needs no comment.

### COTTON GREATLY IMPROVED BY POTASH

The cotton planters of the South are fast recognizing that the use of potash in feeding the soil in which they grow their cotton insures them a bumper crop of high quality. Potash, they find, puts body into the product. This is in line, also, with the experience of farmers engaged in growing vegetables and fruits. They find that the use of potash means an increase in quantity and quality of their crops. Dr. N. J. Harper, director of the farm service bureau of the South, in speaking of potash as a soil food, says: "If it were not for the potash the shirts that we wear would be of inferior quality. The influence of potash on cotton is to make the fibre strong. It strengthens the soil as well and makes the cotton tissues stronger and tougher. As director of the experiment station, I have conducted investigations along this line in order to find out what the value was to cotton. Where potash was used the cotton fibre was much stronger than where it was not used. I saw thousands of crops of cotton last year that showed the need of potash. The bottom bolls fill out and make good ones, while the top blooms do not, making small bolls and inferior cotton." It has been found that the use of potash makes the potatoes, tomatoes, cabbages, onions, etc., of the truck farmer of better quality, that it puts body and strength into the product. It is important that the American farmer have an adequate supply of good potash available in this country, and this can only be brought about by the development of the American potash industry. Potash deposits exist in this country in many states, and that of California alone, at Searles Lake, is sufficient to meet all demands for several hundred years.

### DUMP DIRT SPREADS BEET NEMATODE

Dirt from beet dumps apparently is the most common means of spreading the sugar beet nematode and should be the first to receive attention in planning control measures. Since the removal of dirt from the dumps seems to be the only practical method of disposing of the thousands of tons of soil annually screened from the beets, precautions must be taken to prevent scattering it. Wagon boxes should be tight enough to prevent soil jarring out along the roads and in the fields. Dump dirt should be disposed of in holes, swamps or waste corners where there is the least danger of its being scattered.

The practice of growing beets year after year on the same field gives the nematodes an excellent opportunity of becoming established if they are once introduced. A definite system of crop rotation is said to be advisable with not more than two years of beets in succession. The fertility of the soil will thus be maintained, and much of the danger from insect pests and plant diseases will be avoided at the same time.

When nematodes are found in a locality action should immediately be taken to prevent their spread. This should be made a community affair, and the following measures are being adopted by some of the farm bureaus:

The sugar company operating in the district is requested to refuse contracts for beets grown on soil that is known to be infested with the sugar beet nematodes.

When infested soil happens to be planted the owner and the sugar company are to make arrangements for handling the beets from the infested areas separately and not allow the infested beets to go through the dumps while other beets are being handled.

The practice of throwing dump dirt along public highways should be prohibited by law if necessary.

### WATERPROOFING CEMENT SILOS

Answering inquiry as to waterproofing cement silos, C. M. Evans of the extension service of A. & M. College of Texas, writes:

"The best material that we have found for this purpose is either coal tar or paraffine. These articles are both water and acid proof and prevent deterioration of cement walls, if it is applied every two or three years. Where coal tar is used it is usually warmed up and applied with a paint brush or it may be sprayed on the walls. Paraffine is handled in the same manner."

Uncontrolled fires in the forests, hay, grain and pasture areas of California did damage last summer estimated at approximately one million dollars to say nothing of the killing of thousands of baby trees the value of which fifty years hence cannot be estimated.

# Steadfast as the Oak Tree—Time's Judgment on the Colt "Gas Well"

THE oak tree is a living symbol of solidity, sturdiness and durability.

Only after an amazingly long and sturdy existence does it bow to the will of Time.

Having read about the marvelous COLT Lighting and Cooking Plant, you doubtless have wondered how *permanent* it is. How long it will continue to shed its incomparably beautiful white light. How long your wife will have that delightful city convenience of cooking, ironing and heating water by Carbide Gas. How simple will be its operation. How economical. How much attention will be required. How often you will have to call for service, replace parts and units, mend and repair. *In a word, how will the COLT weather the Test of Time.*

Let COLT users speak. They know. They speak from experience—*long* experience. And there are legions of them. Altogether close to a half million farmers and others in rural communities light and cook with this wonderful, non-poisonous Carbide Gas. Here are three letters out of scores that testify to the oak-like durability and sustained perfection of the COLT.

### Twenty-four years' Service, practically no repairs

April 28, 1919.

J. B. Colt Co., New York City.

Gentlemen: — Answering your letter of recent date, will say: We have used your Colt Generator for about twenty-four years. It is a 200-light machine and we have 200 lights hanging on it. The Generator has given us the best of service in all this time. The machine has been doing its work at practically no cost to us for repairs of any kind. Very truly yours,

(Signed) P. R. JOHNSON.

*There is the test of time.*

Another letter from Bradford Norman, 5 West Marlborough Street, Newport, R. I., reads:

"J. B. Colt Co., New York, N. Y.
"Dear Sirs:

"Will you please send me one felt filter for my machine? This machine was installed over twenty years ago and has given perfect satisfaction during that time and the above order is the first expense outside operating (an occasional drum of carbide) that I have had to make."

*The test of economy—less than one dollar in twenty years for part replacement!*

### After Ten Years, Works Like New

### Cheapest and Best Farm Light

Shiloh, Ohio, May 22, 1920.

To whom it may concern:—

Ten years ago I had a J. B. Colt lighting system installed in my former home at Lexington, O., for which we used continuously during that time for both lights and cooking, and never cost one penny for repairs, to-day my younger brother lives there and it works as well as the day it was installed.

One year ago I purchased the farm where I now live, and one of the first things I did was to buy another J. B. Colt light plant and have it installed. I have my house and barns both lighted with it and wouldn't do without it for several times the cost, after ten years use I figure it the cheapest and best light for the farmer.

Very Respectfully Yours,
C. K. INK, Shiloh, Ohio

### The Final Test

The Government needs for its beacon lights at the entrance of harbors and along rocky ocean shores the most dependable and economical lighting system it can procure. What light is used? CARBIDE LIGHTING! What generators? MOSTLY COLTS!

### Simplicity and Economy

Feed the generator Carbide once in a while and run water into the water chamber—that's all you need do. The machine makes the gas automatically. *No continual replacement of parts and power units. No service necessary. Your Colt is a lifetime investment in reliability, simplicity and economy.*

The COLT comes from factory to farm—sold direct to you by COLT solicitors—no distributors or dealers to take a profit. This applies everywhere. A substantial saving here.

### Don't Invest in Any System Until You Have Heard the Full Story of COLT

An investment in better light, better cooking, comfort, convenience and happiness indoors is the best investment you can make—*Get the FULL STORY of the COLT before you make that investment.* Send post card to address below today.

# Peach Drying

By L. C. Barnard, Division of Pomology, U. C.

IT is possible to dry almost all varieties of peaches. Naturally some are better suited for drying purposes than others. The Muir and Lovell are considered the best and the Elberta ranks third. However, the following varieties are also dried on a commercial scale in California: Foster, Salway, Early Crawford, Late Crawford, Susquehanna and Wheatland.

The qualifications of a good drying peach are that it shall have a yellow flesh, firm and dry, be a freestone, of good size, and have good quality.

### Harvesting

When a peach is slightly soft to the touch over the whole surface it is ready for drying.

Peaches are harvested similarly to apricots, i. e., either picked from the tree or shaken or knocked from the tree onto the ground or onto a canvas sheet spread under the tree. Picking the fruit direct from the tree gives the best quality of dried product. Data have been collected showing that 61 pounds of slabs per dry ton is the result for peaches shaken to the ground as compared to five pounds of slabs per dry ton for peaches which were picked direct from the tree. The trees are usually gone over two or three times.

### Cutting Process

Peaches are cut completely around the suture, the pit removed and the halves laid, cup side up, on the drying trays. Care should be exercised in making the cut clean and not ragged, also in laying the cut fruit as close together on the trays as possible.

### Sulphuring

Most fruits, except prunes and some grapes, are sulphured before drying in the sun. Object: All fruits contain oxidase enzymes. When the fruit is cut for drying purposes and exposed to the air these enzymes avidize the natural coloring matter of the fruit, causing the fruit to turn dark or brownish, unless their action is prevented. The sulphuring process inactivates these enzymes and prevents darkening.

When the sulphur burns in the sulphur house sulphur dioxide gas is formed. This gas, being soluble in water, combines with the water and juices of the fruit, thereby forming sulphurous acid. The sulphurous acid inactivates the oxidase enzymes and also acts as a bleaching agent. Some of the cells of the fruit are ruptured by the sulphurous acid, causing the cooked appearance found in sulphured fruit when broken and examined after sulphuring. The ruptured cells allow the juices to escape into the cup of the fruit. The sulphurous acid kills any insects or eggs which are present and prevents the action of molds or bacteria, thereby acting as a disinfectant and a preservative.

The breaking down of some of the cells by the sulphurous acid also increases the speed of drying. The small amount of sulphurous acid retained in the dried fruit prevents deterioration during storage and is not injurious to the health in any way. The sulphuring process kills all forms of insect life, acts as a preservative and disinfectant, bleaches the fruit, prevents darkening by inactivating the enzymes, draws the juices from the cells into the cups, hastens the drying process by breaking down many of the cells. tends to preserve natural color of light colored fruits.

For peaches an average of eight pounds sulphur per green ton is used and they are left in the sulphur house from three to five hours to over night. When left in over night it is usually because the peaches had been put in the sulphur house at about quitting time.

### Indications that Sulphuring is Complete

Cups half full of juice.

Skin slips freely.

Eighty per cent penetration of sulphurous acid.

Fruit does not turn dark during drying process.

If dried peeled peaches are desired, the skin can easily be removed by dipping the peaches in a boiling lye solution (1 pound of lye to 10 gallons of water), after drying and then dipping in cold water. The skin will then drop off or is easily rubbed off by some form of agitation.

### Indications of Curing Being Complete

Curing is said to be complete when the fruit is pliable or has a leathery feeling, but is not wet or mushy. Most growers state that the fruit is ready for the sweat boxes or the packing house when the skin will not slip or rub off. Others grab up a double handful and squeeze them together tightly and then release their grip. If the fruit falls apart readily it is ready to take in.

### Sweating Process

When the fruit is removed from the dry yard, it is usually dumped into dried fruit bins in the dried fruit house, or into sweat boxes for a week or two weeks, depending on how soon the fruit is to be delivered to the packing house. The fruit which is over dried and over moist tends to become equalized during the sweating process until a uniform moisture content has been reached throughout.

### Drying Ratios or Shrinkage

Elberta, 7 to 1. Lowell and Muir, 4 to 5 to 1.

### Yields

Muirs average 1 1/5 dry tons per acre. Lovells average ⅞ dry tons per acre. Elbertas average 1 dry ton per acre. No figures on other varieties.

### Costs

1921 figures—$10 to $16 per green ton. Includes harvesting and treatment throughout until ready for delivery.

# Avocado Bud Selection

The August meeting of the directors of the California Avocado Association was quite a divergence from the usual routine business meeting. A special subject, "Bud Selection" was discussed and a few horticulturists were invited to attend and give their opinions as to best methods to pursue.

Incidentally it was discovered that Professor L. C. Corbett of Washington, D. C., was in California and it was decided to give a luncheon in his honor at this meeting. Prof. Corbett is the horticulturist in charge of horticultural and pomological investigations for the United States department of agriculture. Some of his lieutenants in California are Shamel, Scott and Kinman. It still is "Professor" Corbett by reason of former positions at Cornell, South Dakota, West Virginia, etc. He has now been with Uncle Sam 21 years.

The list of speakers, of whom Prof. Corbett was last, but chief, will disclose the identity of those present, though two directors were excused from speech making at their own request, W. H. Spinks and R. M. Teague, though the former did tell of his recent visit to the orient and his search for good varieties of the lichee nut to plant in California. President Popenoe presided and called upon those present, in the following order, to give their opinion on proper procedure in a bud selection program: R. W. Hodgson, farm advisor; Dr. W. L. Hardin, past president of the association; Ernest Braunton of the Cultivator staff; William Hertrich, director, and superintendent of the H. E. Huntington estate; T. J. Walker, director, nurseryman, etc.; K. A. Ryerson, farm advisor's staff; Charles D. Adams, vice president avocado association; Secretary Karl M. Wagner, L. B. Scott and A. D. Shamel of the United State department of agriculture; and lastly, the chief of the division, Mr. Corbett.

The latter outlined the proper procedure to place the problem of gaining federal aid before the right officials; also field work in bud selection, and stated that no really conclusive results could be reached under the ten years constant work. He said that for that length of time the problem of determining when a musk-

melon should be picked had been studied and still was not solved. Not only must selection of buds etc., be carried on, but the question arises of best root stock for the various classes and varieties, for light and heavy soils, and many other questions that arise that constitute a "complex" in any new fruit industry. The varietal committee will also have to study the suitability of varieties to variances of soil and climate. On the J. M. Elliott place two standard varieties, Fuerte and Puebla, scarcely fruit at all and topworking to others is seriously considered.

### CARE OF RASPBERRIES

The New York experiment station has sent out a circular on care of raspberries that will interest Californians, for many of our successful growers pursue similar methods.

With the close of the fruiting season horticulturists at the experiment station at Geneva are recommending the removal and destruction of the fruiting canes in all raspberry plantings. These old canes are no longer needed by the bush and they may harbor disease organisms or insect pests which might infest the new growth. The removal of the old canes will also give more room for new growth the next season.

In the spring the canes of red raspberries should be cut back to a desired fruiting height, usually three or four feet from the ground, depending on the vigor of the bush. Black raspberries require more severe pruning than the red varieties as the old fruiting canes should be removed and the new growth checked in the summer by pinching off the succulent tips of the new canes at about two feet from the ground. Since the new canes do not all grow at the same time it is necessary to go over the bushes several times during the summer. In the spring the side branches which have developed as a result of this summer pruning should be cut back from one-third to one-half their length. Purple raspberries are usually pruned in about the same manner as the blacks, leaving them slightly higher.

Raspberry growers are urged to be on the lookout for plants affected with mosaic or yellows and to remove and destroy all such plants, including the roots and suckers, as that is the only way in which the disease can be stamped out. The mosaic is characterized by the mottled appearance of the leaves and the dwarfing of the canes. In setting out new plants care should be exercised that only disease free stock is used as any part of a diseased plant will bring the disease into the patch where it will gradually spread to healthy plants.

### 1921 WALNUTS

In distributing among walnut growers recently a little less than $500,000, which was the final payment on 1921 crop pools, the California Walnut Growers Association made known the surprising fact that less than half of the walnut growers in this state made expenses last year.

This is all the more surprising because, according to W. T. Webber, sales manager of the organization, the business was never before handled at such a low operating cost. The walnut grower got 96 cents out of every $1 taken in by the sales department.

"It is food for sober thought that half the growers fail to make expenses on a crop which brings in a grand total of $8,000,000. This condition was in a large measure due to short crop and poor quality, a result of unfavorable growing conditions but it goes to show that the walnut industry has grown to such gigantic proportions that anything which affects the crop adversely juggles with the prosperity of thousands of families.

"Had the walnut industry last year had the benefit of a protective tariff importations might not have been so heavy and marketing conditions might have been more favorable, despite the poor quality of the California crop."

Association officials point out that while the last payment went out rather late, the growers received a good share of their 1921 harvest money very early in the season, several payments being made before the midwinter holidays, and a $2,000,000 payment being made the week before Christmas.

**The Boggs Potato Grader**

In the McClain potato fields at Inglewood. Note that two small boys operate the grader.

### POTATO GRADERS NECESSARY

"When a crop is nearly all large tubers the grading of potatoes is easily solved. But when they are of mixed sizes a potato grader is necessary, and the best paying equipment I ever invested in."

This is the opinion expressed by F. H. McClain, a prominent potato grower living a little more than a mile southwest of Inglewood. The grader was mounted on a sled or "stone boat" and pulled by two horses. One horse would be ample power but two "straddle" the rows better. The pickers work on each side and empty their buckets into the grader instead of into sacks.

The machine, if so simple a contrivance can be called a machine, divides the potatoes into three grades. Two sacks on the holders at the rear receive the two commercial grades and from a spout on the side issue the really small potatoes, chunks of soil, etc. The grader is "manned" and worked by two boys of ten years, for the real work amounts to little. One turns the crank which works or vibrates the sieves and the other watches for sunburned or injured spuds. There is no "machinery" about this simple equipment, but as Mr. McClain says, "It delivers the goods."

An early quitter is a foolish critter.

# How did your neighbor's last bargain tire turn out

PROBABLY you know at least one car-owner who is always on the look-out for the cheapest tires he can find. He likes to get them by mail or at a sale or at some place where they have big red bargain signs over the door.

It would be fine if he could get "the edge" in every tire trade.

But the dealer can't afford to let him have it.

* * *

Even if a man saw any slight percentage in tire shopping at all—it disappeared when the "Usco" brought the price down.

A *standard* product—and the dealer sells it with pride.

A *good* tire. The dealer has no desire to trade you into a larger profit for himself.

An out-in-the-open tire. The dealer sells you confidence, not price. He wants you satisfied with performance and value. The only way he knows to get your business is to deserve it.

This is the "Usco" idea.

* * *

Compared with the ten-minute thrill of the bargain appeal, the "Usco" is just plain common-sense.

*No tax charged on this*

**30×3½ "USCO"**

# Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

### Grapes on Heavy Red Land

Will grapes do well on heavy red land? What kind would do best?—Subscriber, Corona.

Emperor grapes do well in such land provided they are properly cared for. There is danger of damage from phylloxera, a small root louse which attacks the grape, when vines are growing on heavy land, therefore care should be exercised in the purchase of rooted stock to insure its freedom from the pest.—F. K. H.

### Incomplete Spraying

I am enclosing leaf from squash vine; they are all turning yellow. What can I do for them? Have sprayed with strong mixture of black leaf 40, soapsuds and arsenate of lead, but it does no good. Under the glass I see two different insects.—Subscriber, Placerville.

For best spray see "Thrips and Spider on Beans," page 131, Cultivator of August 5. You are doubtless using a straight nozzle instead of angle nozzle and spray does not touch under sides of leaves where majority of insects always are. Perhaps also, you did not begin in time. It is doubtless too late to spray now.

### Alfalfa for High Level

What variety of alfalfa would you recommend to plant at 1,000 feet elevation in San Diego County, for dry farming? Would it be better to plant in drills? If so, could it be cultivated; if so, what distance shall I plant? Would it live down the weeds and survive if broadcasted?—Subscriber, Jamacha.

The Turkestan alfalfa is best for dry farming, but it is as yet little known and seed is scarce. There is little choice among the other varieties. It is best drilled in, rows two feet apart, ten pounds of seed to acre. Have seen 80 acres so planted in San Fernando, of the very best condition now. It will live and keep down weeds if sown broadcast.

### Fruit Limit of Peaches

Will you kindly tell me whether or not there is an age bearing limit to peach trees. Our trees have been fertilized heavily and this year have made a most beautiful foliage, but very little fruit.—Subscriber, Anaheim.

No limit to peach trees bearing; trees 50 years old in several parts of the state still bearing well. Would suggest that cause of your light crop was frost.

### Top-Working Peaches

Kindly tell me when to bud my cling peach trees to Early Crawfords and how long does it set them back?—Subscriber, Fresno.

The time to bud is now, if you can get mature buds of this season's growth. This may be difficult for growth is still soft and sappy. If so, you will have to wait until about May. If these trees belonged to the writer he would prefer to top-work by cleft-grafting in January. You will get some fruit from top worked trees in third year; should get a good crop fourth year.

### Too Much Water?

Have lost about one acre of five and six year old prune trees from unknown cause. Some of the trees die outright while others will lose a branch about once a week until the trees are dead. I have noticed a gumming on trunk and limbs. The surface roots are in good condition, while the tap roots are dead. Is it a disease that could be cured by spray?—Subscriber, Gridley.

Symptoms point to soil trouble alone. Trees nearly always gum in trouble from any source. Death due to too little water or to rise of water table in soil. As surface roots are alive and tap roots are dead, we would conclude death is due entirely to rise of soil water, which killed lower roots. Of course, under such conditions trees will die. We presume the dead trees were growing on low ground. We do not think any disease is present, or at least it is not the cause of death of trees.

### Melon Wilt

A San Gabriel grower says he had badly affected vines and poured a cup of Bordeaux mixture about the main stem of plants and they recovered when apparently dying of wilt. Toward close of season trouble appeared again so that it is necessary to repeat dosage. Two reports of the effectiveness of this treatment have come to Cultivator office.

### Propagating Blackberries

Please tell me if I can transplant raspberries in August; also how to grow blackberries and loganberries from cuttings? I have had no luck with them in past years.—Subscriber, Vallejo.

Raspberries will safely transplant in August, thought it is not such a good time for it as during winter dormancy. If you attempt propagation of berry plants by cuttings, as you do other plants you will always fail. In all vining berries, throw down the canes and cover with soil; they are very prolific through "tip cuttings." With bush blackberries, dewberries, etc., cut down through crowns with a spade, to divide them in several pieces. Suckers will then shoot up thickly and root independently of the parent plant.

### Tamarisk Windbreaks

Please tell us something of the evergreen tamarisk as a windbreak?—Subscriber, Paradise.

The evergreen tamarisk, Tamarix articulata, was introduced to the Coachella Valley several years ago by the United States department of agriculture as an effective windbreak that would withstand the most adverse conditions. It has been all that was expected of it, has a handsome cypress like foliage of dark green, grows dense, close to the ground, is not affected by heat or winds and appears perfectly at home in the Coachella Valley where it is readily propagated from cuttings. In the Antelope and San Fernando Valleys and in various parts of the state it has grown equally well.

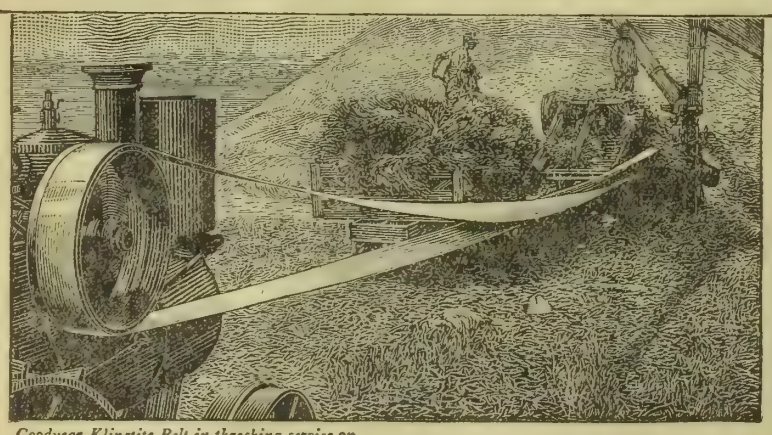
### Making Adobe Bricks

Will you kindly tell me the proper method for making adobes?—Subscriber, San Bernardino.

Adobe bricks are usually made here (Arizona) by Mexican contractors. The cost laid in a wall is about $70 a thousand. The most common size of bricks is 4 inches thick, 12 inches wide, and 18 inches long. In laying them in a wall, three adobes are estimated to make a cubic foot. A clay or loam soil is necessary for making adobe brick. Straw is mixed with the earth, about two bales being required for a thousand bricks. The earth is wet so as to work and pack into molds of the right size. The time required for drying is from one to four or five weeks according to season. When partly dried they are turned and for the final drying are stood on edge. Care, of course, should be taken that the bricks are protected from rain while drying. An adobe wall shuts out the heat better than any other building material that we have. In laying up the walls, mud or mortar is used for putting the adobe together. Door frames, window frames and plates for roof are usually fastened with wooden pegs put in as the walls are laid.—M. E. B.

The following valuable suggestions for painting adobe were given by A. L. Paschall, farm adviser for Cochise County, Arizona, in the Cultivator of April 26, 1919: "Due to the absorption of moisture by cement plaster and the unequal expansion of cement and adobe and the accumulation of air between cement plastered coats and abode, cement plastered on adobe walls does not hold. It is readily noticeable that where an adobe house has been plastered with cement plaster and exposed to the weather for a year, and sometimes less, the plastered coat has begun to fall off. Instead of plastering the outside with cement a much better and cheaper method is to plaster the wall smooth with adobe mud and when dry put on a good coat of crude oil. After the oil has well soaked into the wall and somewhat dried on surface, which will take from one to three months, give the wall a coat of oil and lead paint of whatever color is desired; the nonfading colors, such as black, gray and white are generally to be preferred. Crude oil such as used in railway engines and which costs from four to

YOUR THRESHING—AND GOODYEAR BELTS



*Goodyear Klingtite Belt in threshing service on the farm of Jalmer Herre, Halstad, Minnesota*

*At the height of his threshing*, Jalmer Herre, of Halstad, Minnesota, took time last season to tell many of his neighbors how much better his new Goodyear Klingtite Belt was performing than any belt he had ever had in twenty years of farming.

"*There isn't a sign of slippage*," he said. "No matter how heavy the straw, the belt delivers the full engine power, and there is no jamming of the feeder. Where I used to have daily troubles with ordinary belts—slippage, jamming, re-setting and overheating—the job is pushed through now at top speed."

*Goodyear Klingtite Belts* are the pulleys in a slipless grip. They work the same in all weather, do not shrink, are subject to a minimum of stretch, require no belt dressing, need no breaking in, and wear with the lasting strength of their special ply construction.

*Goodyear Dealers everywhere*, and many progressive hardware merchants besides, sell Goodyear Klingtite Belts, in endless type and in suitable lengths. For further information, write to Goodyear, Akron, Ohio, or Los Angeles, California.

GOODYEAR

Copyright 1922, by The Goodyear Tire & Rubber Co., Inc.

five cents per gallon, is the kind to use for the first oil coating on the adobe wall. This can be either sprayed on or put on with a large roof paint brush. One gallon will cover from 80 to 100 square feet. Several farmers in Cochise County have used this finish for adobe house and find that it is excellent. A correspondent reports that he has used it for inside finish on adobe wall and finds that it is better and cheaper than cement plaster. The oil and paint will not slough off, the wall will last longer and look even better than when plastered."

# Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

### Cow Pox

What can I do for a cow with sore teats? About two weeks ago small watery blisters formed on them and they seemed to be infectious and spread. I have tried carbolized vaseline and zinc ointment but it does not seem to help. Scabs form and continually crack. A friend told me it was cow pox. What is the cause? Is there danger of it infecting the other cows? What is treatment?—Subscriber, Lodi.

These are the symptoms of cow pox. It is due to a contagious germ and is likely to spread through the dairy; the germ being carried on the hands from one cow to another. It may also affect a person but that will do no harm as it is equal to vaccination for small pox. It is the same germ that is used for vaccinating. You may be able to check or prevent the spread of the trouble through the dairy by milking the affected cow last or by washing the hands before milking another cow. Little can be done in the way of a cure except by careful handling of the teats when milking and avoiding as much as possible breaking the scabs and blisters. Keep the teats soft with a little butter rubbed in after milking. Also bathe the teats and udder once a day with a solution of permanganate of potash, using half a teaspoon of the permanganate to a quart of warm water.

### Blood in Milk

I have a young heifer that lost her first calf about four months after breeding. Bred her again about four months later and she came fresh July 16. She did not clean and after four days we pulled the afterbirth away. She is apparently well and has been all along. Her udder seems all right and she does not give clotted milk but after setting over night a little sediment that looks like blood appears in the bottom of the pan. What is the cause and what shall I do to cure it?—Subscriber, Inglewood.

Probably a little of the afterbirth still remains and is causing some irritation which causes the blood in the milk. It would be hard to remove it now. It will probably pass in time. Mix three pounds epsom salts with two pounds common salt and give a handful in the feed once a day. Also get these powders from your druggist: Three ounces powdered gentian, one ounce powdered nux vomica, two ounces sulphate of iron. Mix and divide into 12 powders. Give one powder in the feed once a day.

### Mange on Mule

Please publish in the Cultivator a remedy for mange. We have a mule that has mange in and around his ears and on his tail. Have been using lard and kerosene, one part kerosene to three parts lard, but it does not seem to help very much.—Subscriber, Downey.

Scrub the grease off with soap and warm water and when dry apply a light engine oil same as you use on your auto. If it is due to lice it will spread over the body. Then you must clip him and bathe him with a solution of some kind of sheep dip using a teacup of it to a bucket of water.

### Sidebone

We have a 13 year old gelding that has sidebones on one front foot and is quite lame when worked on hard ground, but when pulling a load the driver does not notice any lameness. He has not been shod since last winter. Is always fat and free to work; has been blistered once with "fly blister." What treatment would you recommend?—Subscriber, Butte County.

Side bones can not be fully cured but can be relieved by soaking the feet in cold water for half an hour once a day. Also when the skin is dry apply an ointment once a day made of two ounces tincture of iodine, one dram iodine crystals and enough lard oil to make four ounces.

### Warts

We have a Holstein heifer coming fresh in December. She has warts over her body, mostly on her neck and under her jaws, rough warts from the size of peas to the size of walnuts. She is apparently well and has good appetite. What is the cause and the cure for the warts?—Subscriber.

You ask the cause of warts: That is something that has not been found out yet. Sometimes you can drive warts away by applying castor oil two or three times a week all over the surface and around the base of the warts. Since there are so many on the heifer we would advise trying the castor oil. If some of them resist the oil treat with nitric acid. Apply the acid with a small swab only to the top of the wart. Apply it once a day for two or three days, then wait until the scab comes off. Repeat this until the wart is cured. Be careful in handling the acid as it is very caustic and will burn your skin or clothing. Keep the acid out of the reach of children.

### Dairy Cows Fail to Breed

I have 30 head of dairy cows and am having trouble in getting some of them with calf. I have six cows that have full time, healthy calves. They come in heat every three weeks but fail to get with calf. I thought it was due to the bull and have changed but the results are the same. Do you know of any remedy?—Subscriber, Long Beach.

Cows that are fat and get very little exercise are apt to fail in breeding. Change the feed and cut out most of the grain for a short time. If possible give green corn fodder or fresh cut alfalfa. Be sure that they get plenty of good water and give them salt regularly. On the day before you expect a cow to come in heat, give her a long drive of five or ten miles and warm her up well. Even after she has come in heat, exercise enough to warm her up will probably bring the results you wish. Use a very young bull.

## SUN-MAIDS IN EUROPE

The Sun-Maid Raisin Growers has sent Marius de Bruyn to London where he will confer with representatives of the association prior to going to Copenhagen to supervise the establishment of an office for the Scandinavian countries. He will then go to Amsterdam where he will maintain headquarters for Holland, France, Belgium and later Germany.

## HAY AND PASTURE CONDITIONS IN CALIFORNIA

As reported August 1 by Statistician E. E. Kaufman of California Co-operative Crop Reporting Service.

The preliminary estimate of the area harvested of all varieties of tame hay is 2,086,000 acres as compared with 2,129,000 acres in 1921, or the area cut over was two per cent less than last year. The decrease in area harvested is due entirely to decrease in acreage of grains cut green for hay. The area of wild hay harvested is four per cent less than last year or about 160,000 acres. As the grain hay has all been harvested the condition of the all hay crop is governed largely by the condition of the alfalfa crop, which is placed at 92 per cent normal as compared with 90 last year and a ten year average of 91. The condition of 91 for all hay indicates a total production of about 4,353,000 tons.

## DAHLIA EXHIBITION

The Dahlia Society of Southern California will hold its third annual exhibition, at the Ambassador Hotel, Los Angeles, September 14-16, from 10 a.m. to 10 p.m. Many new and wonderful varieties have been introduced recently and the society intends to eclipse all its former displays. It now has over 70 members, a few from out of the state.

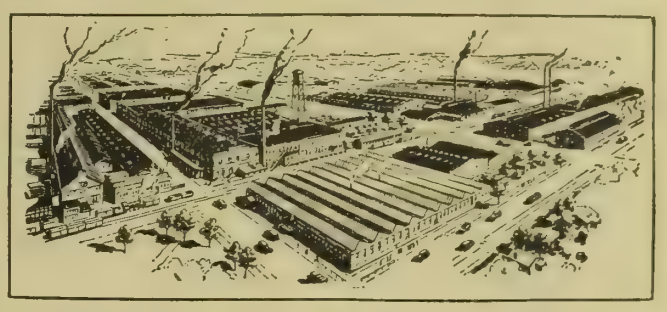
From the way some men avoid it, you would think working for a living was patented.

## New Lamp Burns 94% Air

### Beats Electric or Gas

A new oil lamp that gives an amazingly brilliant, soft, white light, even better than gas or electricity, has been tested by the U. S. Government and 35 leading universities and found to be superior to 10 ordinary oil lamps. It burns without odor, smoke or noise—no pumping up, is simple, clean, safe. Burns 94% air and 6% common kerosene (coal-oil).

The inventor, W. V. Johnson, 31 N. Fifth St., Portland, Ore., is offering to send a a lamp on 10 days' FREE trial, or even to give one FREE to the first user in each locality who will help him introduce it. Write him today for full particulars. Also ask him to explain how you can get the agency, and without experience or money make $250 to $500 per month.



## Forty Acres of Faith and Works

If I could have my wish, every man and woman who is thinking of buying a motor car for use on a farm would spend a day in Jackson seeing how the Earl is *manufactured* in our three great plants.

You would not have to know all about high-grade materials and production methods to see where the Earl gets the endurance, economy, beauty and flexible power which make it the most comfortable, dependable and economical motor car sold at the moderate price of $1095.

From the huge hammers forging crank shafts and forty other units out of five kinds of white-hot steel—through acres of automatic machines—to the paint shop with its sixteen finishing operations—your factory tour would impress Earl quality and craftsmanship on you at every step.

Backing up the car's striking beauty, astonishing road performance and economy, this visible, built-in quality and durability are responsible for the enthusiasm of Earl owners and the overwhelming demand which has kept the factory working three shifts of men in many departments.

The Earl is on display in some near-by city. If you can't come to Jackson, go in and size it up. Ride in it. Take the wheel yourself. I *know* it is the kind of motor car you can afford to own and drive.
Write me for an illustrated catalogue and the name of the nearest Earl dealer. *President and Gen'l Mgr.*

# No heat with this summer meal

A DISH of crisp, delicious Grape-Nuts, with cream or milk (some berries or fresh fruit, too, if you like) is cooling to serve, cooling to eat and cooling to digest —with a charm of flavor and goodness that rouses appetite enthusiasm. No preparation, no cooking—no heating of the body afterward, as heavy, starchy meals do—but well-rounded nourishment for every bodily need.

There's a noticeable feeling of lightness and comfort after such a meal.

Try this way out of the heat, bother and uncertainty that usually goes with the mid-summer food problem.

# Household Department

### I WILL REMEMBER NO UNLOVELY THING

I will remember no unlovely thing;
The trusts betrayed, the day when faith seemed vain,
The friend who proffered me a cup of pain,
All these shall be forgotten, I will sing;
My thoughts shall soar like meadow larks in spring.
Up and away, no more shall grief remain,
But like the joy of sunlight after rain
My recollections shall sweet solace bring.
The little beauties of the common day—
These are enough, these make my faint heart glad;
The moonbeams glancing on the garden walls,
The silver symphony of waterfalls,
And lilacs' scent borne on the winds of May;
Thinking upon these things who could be sad?

—Elizabeth Scollard.

### HOW TO MAKE ORANGE AND APPLE PECTIN FOR YOUR JELLIES

By Fontana Subscriber

I see where so many readers of your paper have trouble with their jellies. So here are some recipes to make jellies "jell:"

**Orange Pectin**

One cup white portion of orange peel (measure after it has been put through food chopper), 3 tablespoons lemon juice, 6 cups cold water. Cut or scrape the white portion from the peel of the orange and put it through the food chopper. Measure, and for each cup add three cups of cold water and then lemon juice. Mix thoroughly and allow it to stand four or five hours in an acid proof saucepan, then boil for ten minutes and cool. Add the remaining three cups of water, bring to boiling point, cool, and let stand over night. Next day boil ten minutes and strain through a cloth. Add 1 cup to a cup of juice. Any kind you wish to make jelly from.

**Orange Jelly**

Two cups orange pectin, two cups orange juice, two cups sugar. Obtain the orange juice by slicing the pulp of the oranges thinly; add enough water to keep the pulp from sticking, and heat until juice is extracted; then strain the hot juice. Combine the orange juice and orange pectin and bring to boiling point. Skim, add the sugar gradually and boil rapidly till jellying point is reached. Pour into hot, sterilized jelly glasses.

**Strawberry Jelly**

Two cups orange pectin or apple pectin, two cups strawberry juice. Add strawberry juice to the pectin and bring to boiling point. Skim, add sugar gradually and cook rapidly till the jellying stage is reached. Pour into hot sterilized jelly glasses.

**Apple Pectin**

One and one-half pounds apple pulp, four pounds lemon juice, 8 cups water. Wash apples thoroughly, remove stem and blossom ends; and cut the apples into cubes without paring or removing the cores. Add the lemon juice and water and simmer until the apples are soft (about 30 minutes). Pour into a cloth jelly bag and let drip, squeezing the bag to obtain all the juice. Then pour juice into flannel jelly bag and allow it to drip without pressure.

Just a few recipes to tell you how to make most any kind of jellies.

### HOUSEHOLD QUERIES

**Watermelon and Quince Preserves**

Can someone tell me the different ways of doing down watermelons? How can quince be used?—Subscriber, Paso Robles.

Watermelon Preserves—The white portion of the melon between the colored flesh and rind is best for melon preserves. Trim off the rind and colored flesh and cut into cubes of desired size. Weigh carefully, drop in boiling water and boil 5 to 10 minutes. Remove and drain. Add 1 pound sugar, ½ pint water and the juice of ½ lemon to each pound of melon.. Boil down to a heavy preserve.

Watermelon Sweet Pickles—Four cups vinegar, 4 tablespoons cinnamon sticks, 8 pounds sugar, 4 tablespoons cloves (whole), watermelon. Cut skin from watermelon; cut rind into small pieces about two inches square; cover with water and cook until tender. Boil sugar and vinegar ten minutes; add spices tied in a bag, simmer until syrupy, about two hours; add melon and simmer one hour. Fill jars and seal.

Canned Quinces — Four pounds quinces, 2 pounds sugar, 1 pint water. Cook sugar and water until syrupy. Pare and quarter quinces; let stand in cold water. Cook in boiling water until tender, then cook in sugar and water syrup five minutes. Arrange quinces in jars, fill with syrup and seal.

Canned Quinces and Apples—Four pounds quinces, 2 pounds apples, 2 pounds sugar, 1 quart water. Pare and quarter quinces and apples. Follow directions for canned quinces excepting that the quinces and apples are allowed to simmer in sugar and water syrup ten minutes instead of five. Fill jars and seal as above.

Quince Jelly—Wipe and cut quinces in thin slices, put in preserving kettle, nearly cover with cold water; cook very slowly until tender. Pour into jelly bag and drain thoroughly, but do not squeeze. Measure juice, allow one pound sugar to one pint juice. Boil juice 20 minutes; add sugar which has been heated on a platter in the oven; stir until sugar is dissolved; boil five minutes or until it jellies. A delicious jelly is made by using one-half quinces and one-half apples.

Old Fashioned Quince Marmalade—Pare quinces and boil until tender in a small quantity of water. Take one bowl of sugar, one bowl of cooked quinces and cook four or five hours or until deep red in color. The next day put in earthen jar (no cover) and cook four or five hours more in oven.

Quince Preserves, Southern Style—Eight pounds quince, eight pounds white sugar. Pare quinces, slice from core and simmer in clear water until tender. Remove to dishes, laying each piece by itself. Put cores and skins in water and boil for 20 minutes. Strain water through jelly bag, and into two quarts of it put 1 pound white sugar for each pound quinces; simmer gently, and when the syrup is half done, begin to cook the quinces in it, putting in only part at a time, simmering for 15 minutes and removing to dishes while the rest cooks. Proceed thus until all of the fruit is perfectly transparent, then seal up in glass jars. One-half quinces and one-half apples may be used in this way.

Quince Dessert—Cut slice from blossom and stem end of six quinces, put them into a dish with enough water to cover up to half the depth of the quinces. Cover with another dish and bake in a moderate oven until the fruit is quite soft, then lift out and place in glass dish. Put half a heaping tablespoon Jell-O into saucepan, add two and a half cups boiling water, liquor from dish in which quinces were baked, half cup sugar and one teaspoon coriander seeds. Stir over fire till they boil, strain and cool, then pour over quinces. When ready to serve put a teaspoon tart jelly on top of each quince. Decorate with whipped and sweetened cream, flavored with half teaspoon almond extract.

**Dyeing in Gasoline**

Will you kindly advise me if there is a dye or coloring that will work in gasoline. I have a wool sport coat that has faded badly, and as it is a little small, will not stand dyeing in the general way without shrinking. I consulted the dye works regarding it and they advised me not to have it dyed as it would then be too small. I have heard about there being a dye or coloring that works in gasoline satisfactorily but do not know what to use. Some say water coloring will work in gasoline but haven't tried it. You will possibly be able to advise me what best to use and the amount of coloring or dye to purchase. The color of the sport coat is a greenish blue and was very pretty when new but was not fast colors.—Subscriber, Murrietta.

We do not know of a dye that can be used in gasoline. A tube of good oil paint may be dissolved in gasoline and used for coloring ribbons, flowers, etc., but our impression is that if coloring matter were dissolved in gasoline and coat dipped in it that

after the gasoline evaporated the coloring matter would separate from the goods in a short time. However, we put this up to our housekeeper readers. Has anyone tried dyeing in gasoline? This department is open to suggestions from anyone who has help to give. We all wish this to be an exchange of practical housekeeping information and invite your cooperation. In regard to this question our only suggestion would be to have the coat dyed a good fast color then, if it shrinks, combine it with other material.

### Getting Rid of Weevils

We have weevils in our food and in our rooms and we can't get rid of them. We have thought of fumigating but we think if this is done in the rooms only that they would still come from underneath the house. Could you suggest anything to kill them?—Subscriber, Los Olivos.

Would it not be possible to close up the space under the house so that it may also be fumigated? If this is done and thorough fumigation given with hydrocyanic acid gas there will be no return of the pests. If possible have fumigation done by a professional for the gas has sometimes proved deadly to the human if breathed in any quantity. If the gas is made in the room use 1 ounce sodium cyanide, 1½ fluid ounces sulphuric acid, 2 ounces water for every 100 cubic feet of space in the house or room to be treated. We should think, however, that a thorough clean-up under the house and fumigation with carbon bisulphide of the foods infested would be sufficient. The fumigation with carbon bisulphide is very simple. In fumigating a barrel of flour, for instance, place one-half to a full teacup of carbon bisulphide in shallow dish on top of the flour and cover tightly. No light should be brought near during the process of fumigation as the gas given off by this liquid is very inflammable. The gas is heavy and will penetrate down through the contents of the barrel. In very severe infestations a second treatment may be necessary. This treatment is also effective for weevils in peas or beans. Sift foods carefully to remove dead insects and eggs. This fumigation does not in any way harm or affect the food value of the materials treated. Keep food after treatment in tightly closed or screened receptacles so that it is not reinfested..

### Tomato Paste

Please tell me how to make tomato paste, the kind you dry.—Subscriber, Los Angeles.

Select ripe red fruit, cut into pieces and boil slowly until soft. Run through a sieve to separate the seed and skins. Then place pulp in porcelain lined kettle and cook slowly until it becomes thick. Spread on clean boards in the sun (or slow oven) until dry enough to cut into cubes. Cut and wrap in oiled paper. When you wish to use dissolve cubes by boiling in water for a few minutes. Fine for soup, sauces, stews, etc.

### Pickling Ripe Olives

Please tell me how to put up ripe olives.—Subscriber, Claremont.

Full directions will be given within a few weeks, in plenty of time for the olive pickling season.

### Pickling Ripe Cucumbers

I have some lemon cucumbers that are too large to sweet pickle whole. Has anyone a recipe for cutting them smaller? I don't know if they will make nice pickles if they were, say, quartered.—Subscriber, Elk Creek.

Ripe Cucumber Sweet Pickle—Peel cucumbers, cut in quarters lengthwise and remove seeds. Cover with alum water, allowing 2 teaspoons alum to 1 quart water. Heat to boiling point and let stand in warm place 3 hours. Remove from alum water and let stand 1 hour in ice or cold water. Weigh cucumbers and make syrup in proportion—1 part cucumber, ½ part sugar, ⅛ part vinegar and ½ as much water as vinegar.

Oil Pickle—This is a very delicious way of using the ripe lemon cucumbers: Slice 2 quarts cucumbers very thin (remove skins if hard and spiny), cover with boiling water. When cold, drain and cover with weak brine and

Don't You Miss this Money Saving Opportunity

## This Catalogue is Yours FREE

### This Golden Jubilee Catalogue Celebrates Our Fiftieth Anniversary by Offering You Everything for the Home, the Farm and the Family at the Lowest Prices of the Day

TO write today for your free copy of this big Golden Jubilee Catalogue will mean a saving of many dollars to YOU this Fall.

It answers every question about price, establishes for you the right price to pay for everything you buy.

Fifty years' experience in manufacturing—in right buying—has gone into this book. Fifty years' experience in low price making is here at your service.

Write for this Catalogue. Know the right price to pay for everything you buy. Take advantage of the many big bargains it offers—the many, many things offered at less than market prices.

This advertisement is printed to tell you of the saving this book offers you, and to tell you that one copy of this Catalogue is yours—FREE. You need merely write us a postal, or fill in the coupon below, and one copy of our big Golden Jubilee Catalogue will be mailed you FREE.

TO THE WOMAN: This free Catalogue offers you the newest styles, selected by our own Fashion Experts. And all the usual extra "style profit" has been eliminated from our prices.

It offers you everything for the home at a big saving: Rugs, Carpets, Curtains, Furniture, Home Furnishings of all kinds of standard quality at money saving prices

TO THE MAN: Think of an all wool—virgin wool suit for less than $15.00. This is an example of our Golden Jubilee Bargains. Everything a man needs, to wear or to use, is offered at prices that mean many dollars saved

FOR THE FARM: For fifty years the American Farmer and Montgomery Ward & Co. have helped each other. This book outdoes all our past achievement in making low prices for you.

Fencing, roofing, tools, paint, hardware—everything the farmer needs is offered at a saving.

**Your Orders Shipped Within 48 Hours**

We announce a new perfected service for you.

After a year's work and study, originating and testing new systems, and employing experts, we have perfected a new system that makes certain a very quick and satisfactory service to you.

Practically every order that comes to Montgomery Ward & Co. this season will actually be shipped and on its way to you in less than 48 hours.

Lower prices, better merchandise, and now a new service. True it is indeed that: "Montgomery Ward & Co., the oldest Mail Order House, is Today the Most Progressive."

let stand 24 hours, then drain. Mix together ¼ teaspoon each cloves, allspice and celery seed, 1 teaspoon cinnamon, ¼ cup sugar, ¼ cup mustard seed, ¼ cup olive oil, 2 cups very thinly sliced onion, and add to the cucumber. Mix well and add enough cold vinegar to cover well. Store in jars.

### Sweet Pickles—Swiss Cookies

Please print directions for making little sweet cucumber pickles, the kind you buy in the stores and a recipe for making Swiss cookies, the kind you buy in stores and a rescriber, Santa Rosa.

If Subscriber, Santa Rosa, will send us her name we will be glad to mail copy of Cultivator of July 15 containing recipe for sweet cucumber pickles. Sorry we have not found a recipe for Swiss cookies.

## HINTS FROM HOUSEKEEPERS

### Just One Year Ago

A subscriber at Fullerton has sent in copy of poem requested under above title by subscriber in this department, issue of August 12. The same song was later received from several other subscribers. The Cultivator appreciates, as we know our readers do, these helpful contributions from readers.

### WIDOW IN THE COTTAGE BY THE SEA

Just one year ago tonight, Love,
I became your happy bride,
Changed a mansion for a cottage
To dwell by the riverside.
You told me I'd be happy,
But no happiness I see
For tonight I am a widow
In the cottage by the sea.

CHORUS

Alone, all alone by the seaside he left me,
And no other's bride I'll be,
For in bridal flowers he decked me
In the cottage by the sea..

From the cottage by the seaside
I can see my mansion home.
I can see those hills and valleys
Where in pleasure I have roamed. .
The last time that I met him
Oh, how happy then were we,
But tonight I am a widow
In the cottage by the sea.

But my poor and aged father
How in sorrow he would wail;
And my poor and aged mother
How in tears her eyes would swell;
And my poor and only brother
Oh how he would weep for me
If he knew his sister
Was a widow by the sea.

### The Red River Valley

In the issue of August 12 of the Cultivator a subscriber from Elverta asks for a song or poem beginning,
"From this valley they say you are going,
I will miss your bright eye and sweet smile."

You were unable to send her the song on account of not knowing the title. It is "The Red River Valley." The chorus is:
"Then consider a while ere you leave me,
Do not hasten to bid me adieu;
But remember the Red River Valley
And the maiden whose heart beats for you."

It was composed during the Louis Reid rebellion in Canada and was a half-breed Indian girl's song to a Halifax soldier boy when his regiment was leaving the Red River country for home.—Pearl Corinne, Gardena.

In addition W. A. Van Loon of Ramona sends words as he recalls them:

From this valley they say you are going,
I will miss your blue eyes and bright smile,
For you take with you all of the sunshine
That has brightened our pathway awhile.

Oh consider a while e'er you leave me,
Do not hasten to bid me adieu,
And remember the bright little valley
And the one that has loved you so true.

Do you think of the valley you're leaving,
Oh how lonely and dreary 'twill be;
Do you think of the fond heart you're breaking,
And the darkness that o'ershadows me?

When you're far from the scenes of this valley,
And they tell you your journey is through,
Then remember the bright little valley
And the one that has loved you so true.

### Home Hints

To crisp lettuce and celery, wash and put in cheesecloth bag, wet occasionally and hang in a cool place. Will keep several days.

To make cookies soft and prevent sticking, cover molding board with linen cloth, flour as you would the board.

To improve the flavor of canned fruit and vegetables, open an hour or two before using.

To keep olives after bottle is opened, pour one half inch of olive oil on top of brine and cork well.

Soak new brooms in boiling water or soap suds. Dip in water occasionally.

Clean aluminum with sour milk.

Use a cork to apply scouring stuffs to knives, etc.

A piece of flannel is much better than a brush for removing dust from silk.—Porterville Subscriber.

### Prune Butter

Five pounds prune pulp, 3 pounds sugar, 2 sliced lemons, 2 small cups walnuts, chopped fine. Cook prune pulp and sugar together ten minutes, then add lemon and cook 20 minutes, then add nuts and cook 15 minutes.—Subscriber, Santa Rosa.

### Creamy Boiled Frosting

Here is an accidental discovery that turned out to be a very happy one. I was making boiled frosting for a chocolate cake and instead of adding water to the sugar when I put it on the stove I absentmindedly picked up can of condensed milk and softened the sugar with that. Cooked it just as usual to a thread and beat it into the beaten egg white. As you can imagine it was rich, soft, creamy and delicious—Reader, Los Angeles.

### Quick Pickles—English Salad Dressing

The helpful suggestions and excellent recipes found in your department are of much value to me in my household work. I find the recipes so very reliable and satisfactory I wish to contribute two of my favorites.

Excellent Cucumber Pickle, Quick Method.—Pack small or medium sized cucumbers in quart jars, cover with vinegar, add to each quart one tablespoon each salt, sugar and white mustard seed, seal and set away. Have made them many times. They keep well and are crisp, delicious and a great saver of time, and may be used in one or two weeks or kept a year.

English Salad Dressing.—One tablespoon flour, ⅓ teaspoon salt, 1 tablespoon sugar, 1 teaspoon mustard. Sift into an egg, beat well, add ½ cup vinegar, ½ cup water, 1 tablespoon butter. Cook in double boiler, beating until creamy and a bit stiff. Pour over two stiffly beaten egg whites (may use yolks if you choose instead of 1 egg in mixture. Beat well. This makes a soft, fluffy salad dressing, lovely for the most dainty salads. When cold if you wish extra richness beat in thick cream or whipped cream.—Strathmore Subscriber.

Grinds Feed!
Pumps Water!
Washes Clothes!
Cleans Grain!
Grinds Tools!
Runs the Churn!
Let the
"Electrical Hired Man"
do your chores
The "ELECTRICAL HIRED MAN"—a 110 volt portable Power Stand of ¼ horsepower—will operate much of your farm machinery.
Besides supplying the power for such chores as pumping water, grinding feed, cleaning grain, clipping stock and grinding tools, the "ELECTRICAL HIRED MAN" will run washing machines, churns, ice cream freezers, etc.
Much of the heavier work on your farm can be handled best by heavier motors. With each installation you will better appreciate the advantages of power-operated equipment.
Our representative in the nearest P G and E office will be glad to give you the average cost of operating different sized motors. Drop in and talk it over the next time you are in town.

### WALNUTS NEED ROOM

C. C. Teague of Santa Paula, writing to the California Walnut Growers, says:

"A walnut tree, unlike some other trees, will not stand crowding. It must have plenty of circulation of air and sunshine around the tree.

"We were so strongly impressed with this that in the fall of 1917 and the spring of 1918 we removed one-half of the trees on our Olivelands property. As originally planted the Olivelands trees were 40 feet apart on an equilateral triangle or 31.5 trees per acre. After removinig 2016 trees, or just one-half, the trees now stand 40 feet apart in the row and 60 feet apart between the rows thus leaving 15.75 trees to the acre.

"The following comparative table shows the production of the Olivelands grove for the three years prior to thinning and for four years subsequent to thinning:

| Before Thinning | | After Thinning | |
|---|---|---|---|
| 1915 | 200,818 lbs. | 1918 | 162,161 lbs. |
| 1916 | 193,825 lbs. | 1919 | 181,051 lbs. |
| 1917 | 156,153 lbs. | 1920 | 209,091 lbs. |
| | | 1921 | 257,830 lbs. |

"A careful study of these figures will show that since the removal of the trees the orchard has been getting progressively better and there is now set upon the grove for 1922 a crop fully equal to that of 1921 if not better. On the other hand you will note that prior to the removal of the trees the orchard was steadily deteriorating.

"These figures and the condition of the grove has so greatly impressed us that this last winter we removed one-half of the trees on our Limoneira orchard which is a much younger orchard.

"My observations lead me to believe that perhaps there is no one factor that is contributing so much to the poor quality of the walnuts from certain orchards and in certain districts, and the poor tonnage production from these districts, as the fact that they are planted too close.

"I would earnestly commend to the walnut growers of California a careful study of their groves and do not hesitate to recommend the removal of a portion of the trees where they are crowding. This will take some courage but the loss, even the first year, will not be nearly so great as one would expect and beginning with the third year, if the orchard had suffered because of too close planting, it will probably yield more nuts than it did formerly and the orchard will get progressively better each year.

"A further analysis made by comparing production figures of the Olivelands grove since thinning with the state's production for these years make the figures even more impressive. For instance, 1917, the last year before the grove was thinned, was one of normal production as was also 1918, the first year after the grove was thinned, thus showing that the very first year, after being thinned, the grove actually produced, under normal conditions, 6,000 pounds more walnuts with 2,016 trees than it had the year before with 4,032 trees.

"Again 1919 gave us a record breakiing crop by far the largest the state ever produced before or has produced since. Both 1920 and 1921 were years of subnormal production, both years falling in production over 8.000 tons short of 1919 yet the thinned Olivelands grove in 1920 show a gain over 1919 of 28,000 pounds and in 1921 a gain of over 76,000 pounds."

### CRACKING OF PRUNES

Cracking of prunes is apparently due to application of water after the growth of the trees has been checked by a period of light irrigation or drouth, according to Dr. W. L. Howard of the University of California. Objections have been raised to summer application of irrigation water at blooming time and at the time of maturing of the fruit. Observations of soil moisture at blooming time have, however, shown that a full supply of moisture exists in the soil maturally at that time and no detrimental effect upon the fruit has been found. With ripening fruit there has been no appreciable difference of quality between irrigated and non-irrigated peaches and prunes; nor has any effect upon the amount of cracking of fruit been observed as due to irrigation at this time.

Fresh water weighs 62.3 pounds per cubic foot.

# PRIMARY ELECTION---AUGUST 29

# CAST YOUR VOTE

FOR

# CHARLES C. MOORE

## A REAL REPUBLICAN FOR UNITED STATES SENATOR

**Moore Stopped the Bubonic Plague in California.**

**He was the First in California to Put His Firm on a Profit-Sharing Basis**

**He Guided the Panama Pacific Exposition and Portola Celebration to Wonderful Success.**

MOORE paid all his employes who entered the U. S. Service the difference between their civil and service pay during the war, and gave them their jobs back when they came back.

He was head of the State Council of Defense in California and started the first Soldiers' Replacement Bureau in San Francisco at the close of the war.

**Moore is a Business Man, not a Politician.**

**He is a true Californian, and has no entangling alliances.**

**He is an Engineer, a Stock Raiser, an Olive, Orange and Lemon Grower.**

**He is a practical Farmer, and Water and Power Expert.**

**Primary Election August 29**

# The Economic Orbit

By A. L. Spellmeyer

THE earth revolves, and we have day and night, and those times when nature is most lavish with her magic charm, the dusk and dawn. As the earth follows its orbit, we have the seasons, and in their turn portions of the earth know summer and winter, spring and fall.

And in the economic world it seems as if bright prosperity and dark loss reach at different times the various activities of mankind, and those occupations which taste the bitter dregs of hardship and loss at one time are later showered with good fortune. Let those who are in the depths now take heed, for their day is ahead.

What puzzles any thinking man is the country loss condition (outside of the great organized fruit industry sections), but the reason is so healthy that we can all find comfort in it, for prosperity is visiting the ordinary middle class and working citizen of the cities and nearby districts.

During the war and the world demand for both food and manufactured articles, the factories were flooded with orders and profits. The factory workers were paid unheard of wages. A man over age and able to work with his hands made $20 to $30 a day in some trades. Ordinary white collar office and professional men had a hard time as their wages did not increase with expenses and advanced costs of living. Teachers had a hard time. Education was a handicap. The wheat farmer and corn farmer and bean grower wallowed in profits so that land jumped to fictional values. Sheep men sold ewes for $20 up and wool for 70 cents. Lemons went to ten dollars in the flu times. The only man who did not reap profits was the cattleman in the West, for he faced a series of hard years, together with the most merciless price manipulation of packers ever known in the control of an article of food.

The factories and their workers had in their orbit their day of prosperity, and lately they have had their night. The men who went to war had their glory in departure and later a reluctant appreciation, and the wounded felt a positive national ingratitude. Their day is due later, and they will be paid ten fold. The sheep men had their day, and night fell on them but has opened once more to a dawn of profit and bright times to come. It has been night a long time for the cowmen, but there is a brightening of the eastern sky that always comes before daylight.

The point of all this is that our white collar men, professional men, teachers and ordinary citizenship that comprises more than a third of the population are prospering. They had a hard time of it but the cost of living has finally lessened so they have money to spend, and that is being invested.

Another fact is evident that many tradesmen are making money and buying their homes. Another fact is apparent that the factory workers did not spend all that they earned recklessly as we have been repeatedly told, but a good portion of them saved the money and are also buying homes.

They tell me the banks are full of money and don't know what to do with it. The country which has been heretofore regarded as the safest place to use the surplus has suffered such loss bankers are afraid of it and the money continues to pile up in cities. The banks hunt five per cent commercial paper and 90 day loans and their reports show enormous profits. Undoubtedly many millions have been used in the building of the tens of thousands of little homes that have sprung up on the city outskirts, and these millions matched the other millions saved by workers, both rough and white collar.

The building boom has also struck the city home owners, and many thousands of them have sold their places at a price double their cost and purchased smaller places in other districts.

Some are making money, and these days that seem so very hard to the country producer are bright days for many of the city folks. Almost any teacher, on present expense and wage, now owns her motor car. It's these ordinary folks who are buying the shiny new cars we see on the road.

We have an unquestioned prosperity among raisin and grape growers, dairymen, walnut men, teachers, city employes, retailers of food of all kinds, bakers, building trades, truck men, bootleggers, gamblers and oil crooks.

We have a comparative prosperity in many other lines and occupations. Even with 27 cent eggs the competent man has been able to show $1 profit on each hen for the year.

Some truck raising districts which have cheap water are doing well. I even know olive groves with free mountain water and cheap land that made money on last year's low prices.

The three things that have alarmed many men, have been the high taxation, national, state and city, the fact that the banks were bulging with money and none to loan to the country now, and the third fact that the owned homes and farms of this nation are mortgaged for more than a third of their value while that banking condition exists. Superficially it would appear as if our financial system had nibbled so deep it had nothing but a shell left to draw sustenance from, but the enormous suburban city growth explains a part of the taxes, (for this condition is national,) and it shows there is still money left, and that the producers have city customers who can pay when the tide turns and when the economic orbit reaches that time which means the dawn of prosperity.

A significant fact is that most of these new city and suburban homes are built on small lots. These people won't raise anything but a few onions. They won't even keep a cow. They must eat meat and bread. The automobile bus lines and high rents have squashed the city out, but these people are not producers of anything but city labor. Babson, the great financial authority states: "fundamental change in real estate values is taking place. * * * If you own city dwelling house property that cannot be converted to business use, the quicker you get rid of it the better." Babson hints at a coming country movement and country manufacturing.

The people of this great husky nation of ours are farther from being bankrupt than some figured. In the country on a steady loss diet we have become moldy and moody, and couldn't afford the gas to get around and so have missed the certain evidence of a prosperity among some people. If they have it we will get it later, as surely as those folks eat. Even though half of the new house prices are fiction there will be enough left. Most of the business that is being done is on a basis of time payments, cars on time, lots on time and houses on time, but it will make certain the habit of saving for many people.

Those due to benefit as the economic orbit develops are 25 per cent of the total 29 per cent of the national population that is engaged in agricultural and livestock pursuits and 15 per cent of the 30 per cent that are engaged in trade and factory pursuits. More than two city people live from the food one countryman raises. One of those two city people can still pay well and the other breaks even.

Strictly speaking, in the most approved method of prophecy we could state the next logical move is a rush to the country when the time arrives that country production is again profitable. When that time arrives we can also prophecy an inevitable desire of all bankers to force loans upon us. Since the days of Solomon it has been riches to him that hath, and the laurel and acclaim to the winner. Every magazine is full of the hind sight prophets who tell us how we lost our money, but I am varying this by telling you how you are going to make yours, if you stick to country production—unless someone invents a substitute for food.

## LIVESTOCK ENTRIES AT STATE FAIR

Early entries at the state fair list the names of a number of the leading

livestock producers of the West who will make their first appearances here this year. Among these is the California Polytechnic School of San Luis Obispo. This institution is entering in seven livestock departments and will have one of the largest individual showings at the fair. It has entered more than a score of Holsteins and Jerseys and also is well represented among the Duroc-Jerseys, Poland Chinas, Berkshires, Percherons and Clydesdales.

J. W. Wherrell of Riverside, one of the largest Jersey breeders in the state, will be present for the first time with a full herd. Other full Jersey herds already entered include those of the Polytechnic school and F. R. Bain of Los Angeles.. J. E. Thorp of Lockeford probably will be present.

Holstein herds entered so far include those of the Millbrae dairy, the California Junior Republic of Chino and the California Polytechnic. Fred Hartsook of Lankershim, one of the best known Holstein breeders of the state, is preparing to take the circuit with two full show herds and will start at the state fair. The Berylwood stock farm at Hueneme, it is reported, will be at the state fair. Azevedo Brothers of Ripon, consistent winners in past years, probably will be contenders.

A. B. Humphrey of Escalon and the Italian Vineyard of Guasti will be back with full herds of Guernseys, and the H. G. Ranch of Buellton will be here with a large herd of Ayrshires.

The beef cattle also are well represented in the early entries, 58 head of Shorthorns and 56 head of Herefords already having been entered. Congdon and Battles of Yakima have entered their Angus herd.

Big entries are being made in the swine department, to date there being 81 head of Duroc-Jerseys, 113 head of Poland Chinas and 79 head of Berkshires. At this rate of entry, the hog show will be larger than ever.

Throughout the sheep department are shown unusually large entries and varieties, while the large premiums in the milk goat department are beginning to attract the breeders of some of the finest of these animals.

## PRIZES AT THE STATE FAIR

Of special interest to community builders is the rearrangement of premiums for county exhibits, designed so as to give smaller counties or counties specializing in the production of one particular article, opportunities to share in the awards. Cash prizes will be awarded as usual to the best county exhibits, and in addition special sweepstakes have been established for county exhibits of apples, pears, peaches, plums and prunes, grapes and citrus fruits, while the sweepstakes for dried fruits has been increased.

Two other new premiums are for the county making the best horticultural display and the county installing the best agricultural exhibit. Special county and association prizes aggregate $1625.

A new cup to be known as the governor's cup will make its appearance this year. It will be awarded to the county making the largest, best and most complete display of its products. Two other cups will go to the county making the best specialty feature exhibit and to the county making the best display of minerals and mining products.

The first cash prize to the county presenting the best specialty feature exhibit will be $250, second $150, third $100, fourth $75. The county mining premiums will be: First $225, second $175, third $125, fourth $75. Premiums for cooperative associations showing the products of two or more counties will be: First $200, second $150, third $100.

The county having the best general horticultural exhibit will receive $200, second $150, third $100, fourth $50. For the best general displays of agricultural products by counties, first premium will be $150, second $100, third $75, fourth $50.

Then will come the special county sweepstakes for specialty products. These are new premiums which are expected by the fair management to encourage more counties than ever to enter the lists, as well as to encourage regular exhibitors to greater care in preparation of different fruits with the object of competing for the new sweepstakes. The new prizes are expected to draw to the state fair, districts which do not hope to compete for the larger county premiums, but which have one product of which they are especially proud and with which they may carry off a portion of the premium awards.

The sweepstakes for apples, pears, peaches, plums and prunes, and grapes are, in each class: First $100, second $75, third $50; for citrus fruits and dried fruits, each $75, $50 and $25. Smaller sweepstakes are provided for the agricultural department.

Throughout the premium lists of both horticultural and agricultural departments, general increases over last year's prizes have been made in order to encourage display of products which are considered of special value to the state. As an example: the total premiums for plums and prunes will be $1150, as compared to $910 last year. The horticultural premiums total $6600 and agricultural $1375.50, exclusive of county and association prizes.

Another department in which the farmer will be interested, bees and honey, will show an increase in total premiums from $144 to $209.

The poultry and rabbit department is expected to be larger than that of last year because of the decided increase in the number of rabbit entries. The fair paid out $2500 in premiums in this department in 1921, and judging from the interest shown to date in the 1922 fair, the premiums paid out will run well over $3500.

Entries closed in the livestock department August 2, poultry August 22, dairy products August 27, and other departments August 23.

The railroads of California will carry all fair exhibits to Sacramento free of charge. The freight charge for the trip to Sacramento will be collected and then refunded by the railroads after the fair, on presentation of proper affidavits from the fair secretary.

---

Maldeta Mercedes Fobes, a 75 per cent sister to Mona Fobes, made 16,853.4 pounds of milk containing 768.18 pounds of butter, in spite of the fact that she was shipped several hundred miles immediately after calving.

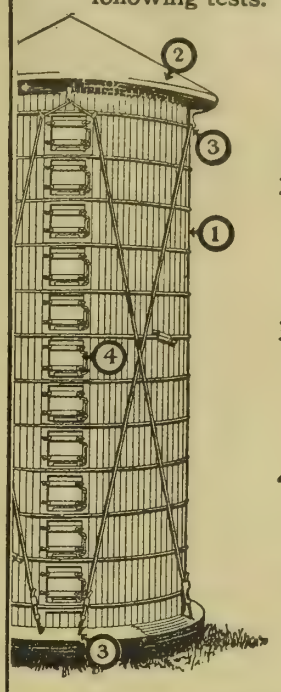
**4 TESTS of a GOOD SILO**

AGRICULTURAL EXPERTS are agreed that, to be "scientifically correct," a silo must meet the four following tests:



1. *Air-tight.* One piece staves and hinged, refrigerator-type doors make the Simplex air-tight.
2. *Walls perpendicular and in a true circle.* The Crisell Tangent Top holds the walls of the Simplex perpendicular and in a true circle.
3. *Smooth inner surface.* Staves of clear Oregon Pine (Douglas Fir), permanently assure a smooth inner surface in the Simplex.
4. *The entire structure must be rigid and strong enough to resist inside pressure and high winds.* The patent, interlocking, diagonal-cable-bracing anchorage system and steel hoops bind the Simplex to its base in a rigid, inseparable unit.

Investigate the Simplex Silo and see for yourself how it meets these tests. The Papec Ensilage Cutters also have distinctive advantages that we will be glad to tell you about.

## Livestock News Notes

A youngster now occupies the quarters so long the home of King Alcartra Prilly at Bridgford Holstein Co. farm, Patterson, and although the task of carrying on behind the great sire that has now gone to Wisconsin is a tremendous one, this young bull seems to have the qualifications to do it successfully. The name of the young sire is King Mead Colantha Prilly. He is sired by Sir Aaggie Mead De Kol, the bull that A. W. Morris & Sons Corporation sold for $11,000, the top of the bulls in the Philadelphia National Sale, to Arfmann & Amos, Middleton, New York. He is a son of Sir Aaggie De Kol Acme and Aralia De Kol Pontiac Mead and has an average of 1,048.02 pounds butter and 24,982.7 pounds milk in one year for his seven nearest dams, all of which have records above 1,000 pounds butter in one year. The dam of the new Bridgford sire is Fairmont Colantha Prilly, a daughter of King Segis Pontiac Alcartra and Prilly Princess Colantha Lyons, a 30 pound daughter of King Lyons and Prilly Princess Julia De Kol, who is the dam of King Segis Alcartra Prilly. It will thus be noted that Fairmont Colantha Prilly is a three-quarter sister to King Segis Alcartra Prilly, being by the same sire, and she is out of a daughter of the Prilly bull's dam. Fairmont Colantha Prilly has been credited with the world's 305 day butter record in the junior two year old class with 853 pounds butter, but this is an error, being her credit for that period as she is continuing for 365 days and has a very fair chance of crossing the 1,000 pound mark. The 15 nearest dams of King Mead Colantha Prilly, including his junior two year old dam, have seven day records averaging over 30 pounds butter in seven days. Ten of his 15 nearest dams, including his junior two year old dam, have yearly records averaging over 1,100 pounds butter, giving him one of the greatest yearly record backings of any bull in service in the West. In addition he has a wonderfully well balanced pedigree, tracing on both sides in short lines to De Kol 2d, Pontiac Korndyke and King Segis, and including some of their most noted descendants among his nearest ancestors. He will be bred to upwards of 90 daughters of King Segis Alcartra Prilly and a large number of daughters of King Segis Alcartra Abbekerk, thus giving him service to females bred in much the same lines as the King Segis Pontiac Alcartra daughters upon which John Arfmann successfully used his sire, Sir Aaggie Mead De Kol.

King Hengerveld Henrietta, owned by E. D. Barry Jr. of Covina, recently completed a 365 day record of 1,014.33 pounds butter from 24,545.1 pounds milk. She is a six year old daughter of King Hengerveld and has two records above 30 pounds butter in seven days, one above 32 pounds. She will be remembered as a beautiful white cow that sold in the 1919 Guaranty Sale as a four year old for $4,000.

Several stock raisers from distant points have verified their intention of exhibiting products and stock at the Ventura fair to be held October 4-8. Among this number are one Oregon farmer and two British Columbia stock raisers.

Believing that special entertainment must be provided for the night crowds that are expected to attend, the Pomona fair will present a horse show Wednesday, Thursday, Friday and Saturday, October 18 to 21 inclusive.

Demonstration of advanced dairying methods will be an interesting department of the Southern California Fair at Riverside in October. Obsolete methods will be shown together with the advanced method now in vogue in the leading dairies of the country. Experts will give short talks each day for the education of the general public.

Swine breeders who will make this season's shows are anxious to get extreme growth on their spring pigs. This is not so easily accomplished, especially during the hot months, but keeping a good balance between the feed given and the amount of exercise will be of great assistance. Too many animals should not be fed together, and it is better to hand feed three or four times a day. Plenty of shade, pure drinking water, no mud holes, no lice, are a few of the things that will assist.

On September 28 an entire dispersal will be made of the registered Holstein females of milking age owned by Carl Ray, Lankershim. Mr. Ray is not going out of the Holstein business, but figures that by selling his cows and retaining his young heifers he will be relieved of a great deal of detail at the present time and will be ready to go ahead again when his heifers reach milking age. The herd of cows to be sold is a group of high class individuals of most substantial breeding and includes a number of cows with records above 30 pounds butter in seven days.

Armour's Bureau of Agricultural Research and Economics at the Union Stock Yards, Chicago, has just issued a booklet called "Progressive Hog Raising" which supplies a great deal of information on the breeding and growing of hogs which best please the packer. The booklet can be obtained by applying to the above address and every hogman should have one.

Winnie Cornucopia De Kol Korndyke, owned by the J. S. Gibson Co., Williams, has just completed a 365-day record of 1,115 pounds butter from 28,354.5 pounds milk at five years of age. She is out of California's first 1200 pound cow, Winnie Korndyke Cornucopia De Kol, 1,201.06 pounds butter from 31,034.2 pounds milk, and is sired by King Kastereintje Segis, a son of King Segis Pontiac Emperor and a daughter of Juliana King of Riverside. It will be noted that she is also out of the same dam as Winnie Korndyke De Kol Alcartra, the Gibson herd sire whose young daughters all under milkiing age are one of the most promising groups of heifers in the state. This record gives to Winnie Korndyke Cornucopia De Kol the distinction of being the only 1200 pound cow in California that has produced an 1100 pound daughter.

The Lewis Company, San Jose, reports sale of two sons of Ormsby Segis Marie Lad to H. Johnson, one of the leading dairymen in the Salinas Valley.

Tosantos Korndyke Walker, the first tested daughter of Sir Aaggie Hiske Walker, owned by E. D. Barry, Jr., of Covina, calving at one year 11 months has made 16.83 pounds butter from 362.9 pounds milk in seven days, going on test 16 days after freshening. Tosantos Pontiac Korndyke, a daughter of King Korndyke Pontiac 20th, also calving at one year 11 months, made 15.54 pounds butter from 423.9 pounds milk in seven days, going on test 19 days after freshening.

John L. Smith of Spokane, Washington, a well known breeder of Holsteins, will judge the dairy breeds, and Ralph M. Jenkins of Orleans, Indiana, a breeder of Durocs and Berkshires, will judge the hogs at the Los Angeles County fair at Pomona. Both are experienced showmen and judges and are very capable men. Mr. Smith will judge Holsteins at the state fair this year. Jenkins judged the Berkshires and Hampshires at the state fair last year.

The annual meeting of the California Holstein-Friesian Association will be held in the main pavilion at California state fair grounds, Sacramento on the evening of Monday, September 4, in accordance with the by-laws which call for the annual meeting to be held on the evening of the first day of Holstein judging at the state fair. The change made in the bylaws last year was to bring the meeting on judging day so that members attending the fair might see the judging and attend the annual meeting in one day.

Among other records recently completed at L. A. County Farm are those of Paragon Whittier Pontiac, a daughter of Toyon Fayne Valdessa and of Kappa Korndyke, a daughter of Sir Manuel Hengerveld. Both of these heifers were purchased at the 1921 guaranty sale and were tested as junior two year olds, the Paragon heifer making 14,859.9 pounds of milk containing 676.10 pounds of butter in 365 days. Kappa Korndyke, who is a granddaughter of the 1000 pound matron, Iowana Witte, made 589.75 pounds of butter from 11,501.1 pounds of milk in 365 days. Both of these are soon due to the service of King Segis De Kol Mead, sire of the 1139 pound state record four year old.

Several very creditable 305 day records are now nearly completed and final figures will soon be announced on the recent breaking of the state records in this class by the senior four year old, Hollywood Lillith Palmyra Abbekerk.

The Los Angeles County Farm is just beginning to get calves of the second generation of their own breeding from the wonderful yearly record sires that have been in use there in the past few years. These calves are backed by four to six dams with records of from 1000 to 1200 pounds of butter in yearly tests, with five to seven nearest dams averaging close to 1000 pounds of butter.

F. R. Bain of Los Angeles will show a splendid string of Jerseys at the Sacramento and Pomona fairs. Mr. Bain has had years of experience in livestock breeding and has a wonderful herd. A recent addition to his show string is a cow purchased from J. Ogden Mills, Jr. This cow has never been beaten in the show ring.

Peggie of Vogt Farm, a junior two year old Jersey owned by Grant A. Brown of El Monte, has qualified for a silver medal by producing 543.64 pounds butter fat from 10,240 pounds milk in a year in Class AA. She carried a calf 232 days of her lactation period.

Entries are beginning to come in for the Ventura County Fair, which takes place Oct. 4-8. Ventura County is having a livestock boom on account of the low price of sugar and the slowness of the bean market, so many ranchers are turning to alfalfa and livestock. It is a good place to show any kind and variety of pure breds, and the fair association always takes excellent care of its exhibitors and shows them a fine time.

### McGILLIVRAY HEIFERS BARGAINS

Buyers a plenty, but unwilling to pay any fancy prices, were present at the McGillivray sale of Holstein heifers on August 17. These heifers were the offspring of cows sold last May and were of excellent breeding, but were not tip-top either in type or condition.

Ninety-two animals were sold for $11,605, which is an average of $124 each. All were tuberculin tested and subject to re-test, which helped somewhat in increasing the price.

M. C. Meade of Santa Anita was the heaviest buyer, taking 40 head, 20 of which were daughters of Colony Zarilda Newman. J. W. Snodgrass of Hueneme purchased a number of calves, some for the Berylwood Stock Farm, of which he is manager, and the balance for the Ventura County Calf Club. The balance of the offering was widely distributed.

The sale was handled by C. L. Hughes for the California Breeders Sales and Pedigree Company, and Col. Ben A. Rhoades was on the block with John A. Davis, now of Los Angeles, in the ring.

### HOG AUCTIONS

Royal I Am, Craigs Pathfinder, Orion Cherry King J. K. and Defender W S K. Nothing but the very best sold and guaranteed to please. Kincaid & Muselman, E. Bakersfield, California.

**Weanling Boars and Gilts by Pathfinder Wonder** (Great Wonder I am ex an 800 lb. Pathfinder sow) for $10 each. Bred sows and gilts. Derryfield Farm, Capital National Bank Bldg., Sacramento, California.

**Greenwood Farm Durocs**—An especially good lot of spring boars. Witherow & Stafford, Live Oak, California.

**Winsor Ranch Durocs**—The best of stock at reasonable prices. BONITA, CALIFORNIA.

## PAINT

ROOFING PAINT

ONLY 15c A GALLON

ASPHALTOID SAVES YOUR ROOF

Best roofing and preservative paint under sun sold direct to you by the manufacturer for only 15c a gallon. Write for particulars and free sample. Woolner Oil Co., 4th and Commonwealth, Los Angeles, Calif.

## TREES

**For Sale**—Grafted walnut trees, also citrus and deciduous trees. Order now for 1922 delivery. Get my prices. Ketscher's Nursery, 1101 E. 4th Street, Santa Ana, California. Phone 572-W.

**For Sale—Grafted Walnut Trees** for season of 1923. Placentia, Eureka, Chase and Payne. Early buyers get the best. C. W. Story Nurseries, Rivera, California.

**Beeman Tractor Cheap** — Young man learn trade. Cash Nursery, Sebastopol.

## SEEDS AND PLANTS

**Carolina Strawberry Plants for Fall Planting**—the most prolific and best berry. Gives crop the first year. Postpaid $1.50 per hundred. Write for prices on larger quantities. G. M. Hawley, El Cajon, Rd. No. 2.

**D. Lotus Seed**—Manchurian stock for Japanese persimmons. Let me include your needs in my 1923 importation from Manchuria. Fred W. Kelsey, Nurseryman & Orchardist, El Monte, California.

## FOR LEASE

**For Lease**—167 acres improved, one mile northwest of Westminster, eleven miles east of Long Beach, known as Creedmoor Gun Club Ranch—would be ideal for dairy. Plenty buildings, two artesian wells, one pumping plant. Can be leased for term of years at fair rental, part of which can be paid in labor. Possession of buildings and part of land any time. W. F. Marks, 1318 West 3rd street, Los Angeles. Phone 52471.

## HORTICULTURAL PRINTING

**Catalogues and Booklets, office forms and correspondence stationery for the nursery, seed and florist trade; half-tone cuts** of many standard plants. Correspondence invited. The Kruckeberg Press, 236 Court St., Los Angeles.

## CORN HARVESTER

**Corn Harvester** cuts and piles on harvester or winrows. Man and horse cuts and shocks equal Corn Binder. Sold in every state. Only $25 with fodder tieing attachment. Testimonials and catalog FREE showing picture of Harvester. Process Harvester Co., Salina, Kansas

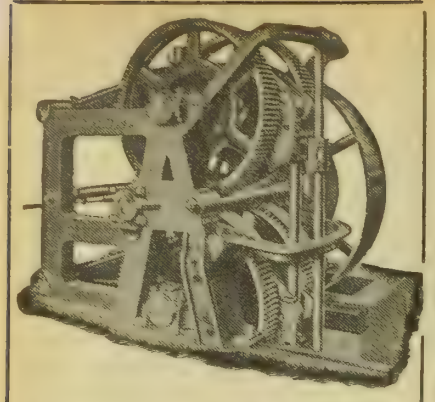
## TOP GRAFTING ORCHARD TREES

By Leonard Coates

Partial failure in many instances is due to the application of hot, liquid wax, its liability to run, leaving air underneath, with the resulting spaces evidenced by the presence of air bubbles.

This method of using grafting wax has largely superseded the old way, when a prepared wax was put on by hand, but observation and personal experience, to get at results, have convinced me that the old way is the better, and almost if not quite, as rapid. The test was made on walnut trees, both California Black and English; every graft grew perfectly, and there was no running of wax and no air bubbles, which would have made daily visits necessary.

The ordinary wedge grafts were used, the stocks being split to receive them. The same care was used that would apply to any similar work, the scions being taken only from the base end of limbs. The wax was from the old formula: 2¼ pounds rosin, 1 pound beeswax, 1 pint raw linseed oil, all cooked together, and then poured into tub of cold water and pulled until tough and smooth. A little practice will enable one to apply this wax, and spread it with the thumb and finger, leaving a job neat and clean, and which anyone may be proud of. I mention this, to encourage the non-professional, as the simplest directions in any standard work on horticulture will suffice. The columns of detailed directions are apt to mystify, and hence to mislead.



THE POMONA

Duplex Plunger Deep Well Pumps

are solving the pumping problems for many users during the period of low water levels. They will lift the water to the surface, and, if desired, deliver it to high elevations above ground and at lower power cost than any other system of pumping water.

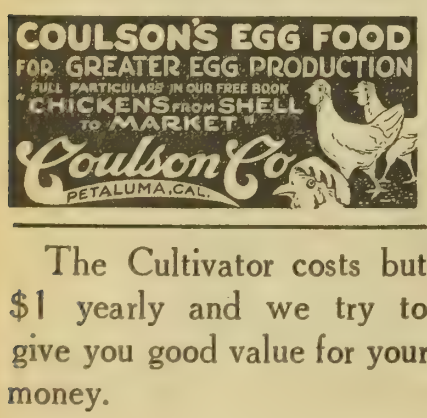
Baby Chicks

We incubate 250,000 eggs every three weeks; the largest and finest equipped electric hatchery in the Southwest. All popular breeds: Rhode Island Reds, Barred Rocks, Black Minorcas, Anconas, etc. Also our famous Oregon-Corvallis White Leghorns. Order now for immediate or future delivery of Baby Chicks, Pekin, Muscovy or Indian Runner Ducklings, Mammoth Bronze baby turkeys. All kinds of pullets supplied—anytime. Incubators and brooders. Careful attention to every order, large or small. Send today for prices.

REDWING HATCHERY
2030 East Florence Avenue
Los Angeles, California



The Cultivator costs but $1 yearly and we try to give you good value for your money.

# Poultry Queries

(Conducted by Jean A. Koethen)

### Poisoned

A few days ago four of my hens were taken with what I call a chill, for they shook all over. Combs are red and hens had been feeding all right. They acted dumpish and sleepy and finally lay stretched out quite helpless. I am feeding wheat and laying mash and the hens have free range.—Subscriber, San Bernardino.

Your hens have evidently been poisoned, but with what it is hard to say for a good many poisons produce practically the same symptoms. What you call chills I should call convulsions, not very violent, perhaps, showing that they did not eat a great deal of the poison. Arsenic from rat poison or arsenical sprays used to kill insects, copper from Bordeaux mixture, lead and zinc from paint skins, all produce convulsions, great weakness and diarrhea. It would be wise to keep the flock shut up till you have examined their range carefully. Each poison has its proper antidote, but milk, white of egg and flaxseed mucilage are good for nearly all.

### Developing Pullets

Some of my pullets nearly five months old are well developed, with big red combs; others are pale with shrunken combs. Some of their droppings are soft, some yellowish, some dark, and some contain red like the pulp of tomatoes. I am feeding a commercial pullet mash. Should I change to laying mash? They are laying a few eggs a day. Some are picking up feathers and eating them. Should they have meat? I feed wheat and cracked corn, sprouted oats morning and night, mash always before them, greens morning and night, charcoal and grit.—Subscriber, San Diego.

Not all the pullets in any flock mature at the same time. Some always develop more rapidly, and there are always in a large flock some culls. If the backward pullets are not ready to lay when they are seven months old you can safely cull them out and market them, but first give them a chance to make good. Your grain feeding is all right if you are giving the pullets all they will eat once a day. If you let them fill up on grain twice a day they will not eat as much mash as they should. It would be better to give the wheat and corn about 4 o'clock, giving more than they will clean up so that there will be little left for early morning. Give the sprouted oats at seven or eight in the morning, greens at nine or ten, and at 2 o'clock moisten some of the dry mash with sour milk or semi-solid buttermilk and feed what the birds will clean up in 15 minutes. Perhaps the meat scrap in the mash is not of best quality. The best thing you can do is to change to a laying mash but add a little corn meal and bran. If the backward pullets seem very thin perhaps you can put them by themselves and give a larger proportion of corn.

### Sand for Litter

Is sand a good substitute for litter? I am using it on my floors.—Subscriber, San Diego.

Coarse sand, sometimes called "wash sand" is a fair substitute for straw, but beach sand is too fine. It would be better to cover it with litter.

### Salt Grass

Is salt grass good for chickens?—Subscriber, San Diego.

I do not know. Will some one who has had experience with salt grass please tell us about it?

### Fattening Turkeys

What is the best feed for fattening turkeys? Mine are five months old. Are they now past the most trying time?—Subscriber, Los Angeles.

A turkey five months old is as good as raised, but do not be in a hurry about fattening. The most successful turkey growers do not begin to fatten till October. For the present bran, rolled barley, wheat and sour milk, with an abundant supply of green feed, is a good ration. About the first of October you can begin mixing a little corn meal with the bran and a little whole or cracked corn with the barley and wheat. Keep feed before them constantly but do not force them. A turkey that is in good condition will fatten on either barley or corn, but whole corn is considered the best feed for fattening. It is not easy to make turkeys eat it when they are accustomed to smaller grains, and for this reason it must be gradually worked into the ration.

### Pumpkin Seed

Is it a fact that too many pumpkin seeds put a stop to laying? Last year my hens had access to a pile of pumpkins and picked the seeds out. They stopped laying almost entirely. Do you think the pumpkin seeds were responsible? The hens had their regular grain feed.—Subscriber, Lodi.

Pumpkin seeds are not recommended as a laying ration, but I do not see how a few could do any harm. If your hens filled themselves with the seeds and neglected the regular laying ration they had nothing to make eggs from. You say nothing about a laying mash. Perhaps your hens had not a balanced ration in addition to the pumpkin. You know a hen cannot lay eggs unless she has first the proper kind and amount of food to maintain her bodily health and vigor and then a little extra for eggs. The hen must have the fat and carbohydrates which are found in grain to keep her body warm and active, and the protein in meat and milk for building up the deep tissues and for eggs.

### Remedy for Ticks

D. Earl Brubaker of Hemet sends the following simple treatment for chicken ticks, which we are very glad to have:

"Four years ago, when I came on this ranch, I found an old henhouse made of old boards that were cracked, split and full of holes, besides being lapped in many places, and as full of ticks as a henhouse can be. I was advised to burn it down and build a new one, but I could not afford to do that. Then I was advised to use a mixture of kerosene and crude carbolic acid, but the carbolic acid was excessively expensive at that time, and I had to look for something cheaper. I took crude oil and diluted it with kerosene, making mixture that could be put on with brush. I used a big paint brush and painted every square inch of that henhouse, also sprinkled the dirt floor liberally. I did this three times ten days apart and saw no more ticks for six months when I noticed a few on the ceiling. This was painted again, and that was the last of the ticks. The only objectionable feature about this treatment is that it makes the ceiling black and oily. A larger proportion of kerosene will help this. If possible leave the poultry out for a few days till the oil dries and hardens. I never expect to have any trouble with mites as long as those boards are coated with crude oil, even though it is dry and hard."

Thank you, Mr. Brubaker.. I wonder if you thought about using the oil from your automobile crank case. Some one wrote me about using that for mites, and when I tried it I found it as good as kerosene and crude carbolic acid and cheap as dirt. If it will rid a house of ticks as well as mites the motorist is in luck.

### Which Are the Layers?

A few of my hens are well built for laying, plenty of room between keel and pelvic bones, pelvic bones thin and pliable, yellow color well laid out of leg and beak. But they were molting by July 20. Another lot is similar in type, but their legs are still yellow. They show no signs of molting yet. Would you keep either or both of these groups or send them to market?—Subscriber, Hemet.

I think I would separate the two groups and keep a record of their performance for a while before I parted with either. Generally speaking, the molting test is more reliable than any other, but there are exceptions, of course. Some poultrymen claim to get good production from early molters, and there are others who eliminate every hen that molts before September. The appearance of the hen should be something of a guide. Has she an alert eye, large red comb, short toenails? Is she always on hand for meals and off the roost betimes? Does she sing at her work? Is she well developed, not fat but muscular? Is her abdomen soft and round, just fitting into the palm of your hand? A little watching will show which are the hens that ought to be good layers for another season, but only the trapnest can give infallible testimony to a hen's ability.

### Peewee Eggs

My six months old Leghorn pullets are laying about 40 per cent, but 60 per cent of the eggs are peewees. I feed equal parts corn, wheat and barley and a mash of 95 per cent bran and 5 per cent bone meal, also semi-solid buttermilk in solid form, 10 to 12 pounds to 500 birds. Is that per cent of peewee eggs usual at 6 months?—Subscriber, Ontario.

That does seem like a large per cent of peewees at that age. Perhaps it is because you are feeding a maintenance mash instead of a regular laying mash. That maintenance mash is recommended for keeping precocious pullets back until they are fully ready for laying. If you will keep a regular laying mash before the birds, feeding sprouted oats or barley in the morning, hard grain at 4 o'clock, and some of the laying mash moistened with the semi-solid buttermilk (diluted with water) at 2 o'clock, you will soon have larger eggs.

### Chicks Dying

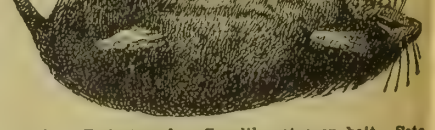
My little chicks two weeks old swell up and seem to get dizzy just after taking a drink. They fall over and soon die. Am feeding corn meal mixed with bran and chick feed and sour milk and a little alfalfa.—Subscriber, Little Rock.

I do not quite understand how you are feeding. If you are giving a wet mash in this hot weather that might account for part of the trouble. It looks as if the chicks were being overcome by the heat, but they may be suffering from indigestion as well. A moist mash that is not cleaned up quickly sours in hot weather and causes endless trouble. As you are in an unusually hot locality you had better leave off both the wet mash and the corn meal. Either get a prepared buttermilk mash or mix equal parts bran, rolled breakfast oats and middlings. Keep this before them half a day at a time to begin with, but lengthen the time so that by the end of the first month they will have it all day. For the grain feeds, give commercial chick grain in feeders but mix

Wipe Out Every Rat and Mouse

Amazing Discovery Quickly Kills Them All. Not a Poison

Rats, Mice, Gophers—in fact, all Rodents can now be wiped out easily and quickly. Imperial Virus will do it. The original, time-tested Danyz, fluid true Virus. Entirely harmless to humans, poultry, stock, pets, etc.



Infects Rodents only. Greedily eaten on bait. Sets up burning fever. The pests die outside, hunting air and water. Imperial Virus is put up in sealed bottles, guaranteed to retain full strength and potency. Only safe and sanitary method to overcome these pests. Indorsed by more than 60,000 users, including Farm Bureau Experts, numerous factories and large, nationally known institutions.

You Can Get Yours Free

Send no money—just your name and address to Imperial Laboratories, Dept. 1107, Kansas City, Mo., and they will send you by return mail two regular full-sized $1.00 bottles of Imperial Virus (double strength). Pay the postman only $1.00 and a few cents postage when the package containing the two bottles arrives. Use one to rid your place of the pests, and sell the other to a neighbor, thus getting yours free. Special inducements to represent us.

NOTE—Readers risk no money in accepting the above offer, as Imperial Laboratories are fully responsible, and on your request will refund your $1.00 any time within 30 days, if you are not entirely satisfied with the results.

a little wheat and kafir corn with it. By the end of the month you can drop the chick feed and use wheat and kafir corn alone. Keep sour milk before the chicks as much as possible. Be sure they have shade; let them run in the garden if you can; if not, sprinkle their run every day. Keep cut alfalfa before them. Summer chicks rarely do as well as those hatched in early spring. You will have to do all you can to provide spring conditions.

## MAKING GOOD WITH POULTRY AND FRUIT

(Continued from Page 197)

he purchased on contract a ten acre farm with a small but comfortable house, a two and a half acre bearing orchard, and but little else. This was the period of high prices, and while the times permitted him to sell his place at a profit it also represents a higher price for his investment than would be necessary now, and although today his place is worth more than he paid, a part of the enhanced value is due to improvements which he has added.

The first work of improvement was to build a concrete incubator house, not a cellar. A study of the ventilation of cellars, and the pure air requirements of the hatching egg has convinced him that incubators ought not to be put below the surface of the ground. The ventilation system is so arranged that a constant circulation of air is maintained, the building kept warm when the weather is cool outside, or when it is hot outside the interior of the house seems cool. There is never any direct draft onto any part of any incubator. This house, which is 30 by 50 feet, holds incubators with nearly 20,000 egg capacity, one or two being added at the close of this season. Forty-five thousand day old chicks were hatched this past season, and orders were behind for nearly the entire season, for instance, the first of February he was booked to capacity to May 1.

### Building Up Breeding Plant

It is his ambition to build up a breeding plant, and he is well along with his plans. All birds show strong vitality, and some excellent stock has been introduced. Trapnestinig will be begun this fall with 120 birds in flocks of 20.

The main flock is housed in long laying houses with units of 20 foot pens, the house being 16 feet wide. This flock of breeders has free range, although the double yarding system is to be installed. The brooder houses and the houses for the young chicks are located in the orchard.

The laying stock is fed dry mash in hoppers. This mash is composed of 200 pounds bran, 100 pounds shorts, 100 pounds corn meal, 60 pounds meat meal and 5 pounds charcoal with one pound salt. For grain he feeds wheat, hulled barley, hegari, and cracked corn. In summer the proportion of wheat to the starchy grains is increased.

For the young chicks Liggett says: "I have had some trouble with young chicks from feeding prepared chick foods that were mouldy. Some seem to gather moisture, possibly some are accidentally wet, but a very slight mould will prove fatal to very young chicks. I prefer, therefore, to feed a more expensive ration, and have found that a ration that is composed of one part regular rolled oats prepared for human food, one part bran and one part hard boiled eggs chopped fine is ideal and gives splendid results."

This ration is fed for three weeks and then the chicks are fed the same ration as the laying hens, grain being fed in addition. The eggs that are used are the first test eggs from the incubator.

### Nothing Wasted

Close economy has been necessary, but at that the same general principles of factory economy have been followed, that is, elimination of waste, so far as possible. Pigs are kept, and the cull eggs from the incubators that are not needed by the young chicks are fed to the pigs. About the time the incubators are closed for the season the first of the apricots come on, and there are culls that are readily disposed of by the pigs and at a profit. Following the apricots come watermelons and then peaches, and then a little grain, and the pigs go on to the butcher.

The roosting houses are kept well cleaned, and this fertilizer which so many of our valley farmers are slow in valuing at its true value, together with the manure from the pigs, is regularly hauled out to the land, and the crops that are grown prove that this by-product helps to pay the bills. The orchard receives a good deal of fertilizer from the chicks that run in it. In the fall it is thoroughly plowed and sown in barley. This method of handling produces good crops of choice fruit. One acre of apricots this year brought a revenue of $375, not counting what was consumed by the family or the culls that the pigs ate. Last year the orchard (balance in peaches), brought a total of $600, and probably will do as well or better this season.

A family garden furnishes a large part of the living, the grocery bill rarely running over $2 a week. Several acres of ground, not yet needed for chickens, have been used for growing truck crops. This naturally fertile soil, made doubly rich by application of poultry droppings and the fertilizer from the pig pens, yields wonderful crops. One-fourth of an acre of lettuce returned a little over $200, and one acre of green peas gave $350 of revenue. Four acres of watermelons are just being harvested and will probably net $600. Most of this land is fenced in one and two acre tracts. The family cow is pastured in one field which was in beans and lettuce. Later all of the truck crop land will be put in winter grain, mostly barley, to furnish the green feed essential for producing fertile eggs.

Growing truck crops fits in fairly well with the poultry work, but the main idea in growing truck was the revenue which was badly needed. Liggett plans to quit growing truck crops after this year, as with the growing poultry business, giving more attention to breeding and especially the trap nesting, there will be less time, and the place now is on a paying basis where this extra work will not be necessary.

What Liggett has accomplished on this place proves what a man of determination can do even without capital. Many would not care to take the chance, to burden themselves with the worry of debts, and to endure the hardships that are necessary, but Liggett and his courageous young wife as they see the two happy, healthy kiddies playing amid the shaded nooks of the yard of their own home, as they view the improvements which have been made and glimpse a vision of the breeding plant as it will be within a year or two and which they are building up slowly, have no doubts that it has paid to take the chance and endure the privations.

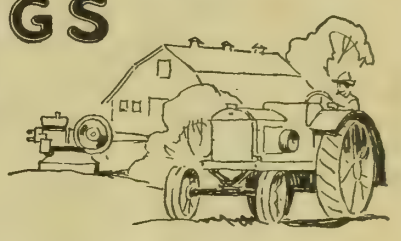
McQUAY-NORRIS
PISTON RINGS
PISTONS
PINS



*Is your gas power machinery wasting money that could be saved by installing them?*

Every motor—whether it is your automobile, tractor, truck, engine or pump—has three vital units. They are the piston rings, pistons and pins. It's the condition of these three units which determines the motor's power and economy.

If they are worn, full power and economical operation in that motor are impossible.

Wear in these three units many times causes farmers to sacrifice a good car or tractor or engine, when, if they had renewed them, the machine would have given satisfaction for a long time more.

When you realize the load these three units carry, it's easy to understand why they wear. They have to seal the combustion chamber, withstand the force of every explosion and the stopping and starting of the pistons as they shoot up and down their cylinders. It is not strange that they wear and when they do the motor gets noisy and wasteful. It frequently causes sacrifice of a good car or tractor that would have given much longer satisfactory service if these worn parts had been replaced.

Send for our Free Booklet, "To Have and to Hold Power," which explains the whole subject of motor wear and its correction.

ADDRESS DEPT AB

MCQUAY-NORRIS MANUFACTURING COMPANY, ST. LOUIS, U. S. A.

**Pistons and Pins**
McQuay-Norris *Wainwright* Pistons and Pins—gray iron pistons as light in weight as safety permits—specially designed for replacements—available in standard sizes and over-sizes—also in semi-finished form 75-thousandths over-size—pins of special hardened steel, ground to exceptional accuracy.

$1.25 Per ring — Leak-Proof — an exclusive two-piece design preventing loss of gas and compression. Gives equal pressure at all points on cylinder walls. For all piston grooves except top, which should have Supercyl. Each ring packed in a parchment container.

$1.00 Per ring — Supercyl—Keeps lubricating oil out of combustion chamber. Collects excess oil on each down stroke of piston and empties on each up stroke, which ordinary grooved rings cannot do. Each ring packed in a parchment container.

50c Per ring — *JIFFY-GRIP*—a one-piece ring. Non-butting joint, which can be fitted closer than ordinary step cut—velvet finish—quick seating. "Seats in a jiffy." To keep them clean and free from rust, each ring is packed in an individual glassine envelope.

**Snap Rings**—of the highest grade. Raised above the average by McQuay-Norris manufacturing methods. Their use insures all the satisfaction possible for you to get from a plain snap ring. They are packed twelve rings to the carton and rolled in waxed paper.

**Raisins, Sun-Maid Raisin Growers' Prices:**

Under the schedule of prices for the 1922 crop of raisins announced by the Board of Directors of the Sun Maid Raisin Growers to the trade August 9, the growers will receive 5¾ cents for Muscats, 6 cents for Sultanas, and 6½ cents for Thompson's sweat box basis. Northern bleached Thompsons, (Sun Maid quality) oil dipped, soda dipped or choice sulphur bleached Thompsons will bring the grower 6¼ cents. Fancy Northern sulphur bleached (Sun Maid quality) will bring $40 more per ton, extra fancy Northern sulphur bleached (Sun Maid quality) $60 more per ton. Southern bleached (Sun Maid quality) oil dipped, soda dipped and choice sulphur bleached will net the grower 6¾ cents. Fancy Southern sulphur bleached (Sun Maid quality) will bring 9cents. Extra fancy Southern sulphur bleached (Sun Maid quality) will bring 9 cents. Extra fancy Northern or Southern bleached packed by growers, (California brand) soda dipped, oil dipped and choice sulphur bleached are named at 5¾ cents. The price for fancy sulphur bleached (California brand) 9¼ cents. Muscat layers 3 and 4 crown, all packs will bring 7 4-10 cents. Six crowns will net 8 4-10 cents. A $15 bonus will be paid for making layers in addition to half-cent quality bonus for extra standard grade. Layers will be settled for on packout basis as provided for in the crop contract. "These prices," said F. A. Seymour, general manager, "will be returned to the grower on a sweat box basis. Their realization, however, depends upon the disposal of the entire crop at the new prices named by the board."

1921 crop practically sold out.

### HONEY

Northern California: Demand and movement light. New crop reported to be of fair size but not yet on market in sufficient quantity to stabilize prices.

### HAY AND FEEDSTUFF

A. W. Scott Co. says under date of August 19:

Receipts past week 1765 tons as compared with 2282 previous week. The San Francisco market has continued slow and dull. Export and coast shipments have been more active and with better life than for some time. Interior trading has been heavier and several large holdings have changed hands. In general, the selling prices have been at lower levels than producers have been asking for some weeks. Railroad conditions have hastened shipment for fear of a tieup, which caused farmers to crowd everything on to the transportation lines. Alfalfa has been doing better than for some time. This has apparently been caused by a general demand from consumers in every section who seemingly fear shortage of cars or blocking of traffic will prevent them from getting their supplies later on. At the present writing, it looks as though a settlement of railroad strike conditions is imminent and this sudden demand is likely to drop back to the quiet conditions that have seemed to become almost normal.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the market in San Francisco (for prices to consumers, charges of switching, cartage, commission and handling expenses must be added according to conditions).

Los Angeles, August 23, 1922.

Because of transportation difficulties light receipts of Valencias in eastern markets have still further strengthened prices but because of small quantity remaining for shipment growers are sitting easy. Estimates of new crop not considered of much value till next month.

Hot weather in the East has improved lemon prices. Strong demand from all points. 24,000 boxes of foreigns available in next 30 days.

**Citrus Shipments**

Shipments of citrus fruits to date since November 1, 1921. Southern California: Oranges, 21,047 cars; lemons, 8,763; total, 29,810. To same date last season: Oranges, 35,399; lemons, 9,907; total, 45,306. From Central California to date this season: Oranges, 5,099; lemons, 106; total, 5,205. To same date last season: Oranges, 6,603 cars; lemons, 185; total, 6,788. From Northern California to date this season: Oranges, 372; lemons, 8; total 380. To same date last season; Oranges, 305; lemons, 5; total 310.

## CALIFORNIA CATTLEMEN'S REPORT

San Francisco, August 21.—The Chicago market received slightly less cattle during the past week and showed an increase of approximately 25 cents per hundred compared with the week previous.

The San Francisco market remains strong, with a particularly good demand for really choice fat cattle. Sales are reported at 7 cents f. o. b. ranch for steers in nearby counties, and 5½ cents f. o. b. ranch for cows. Sales are reported in Tehama County for 6½ cents f. o. b. ranch for steers and 5¼ cents for cows, in Lake and Mendocino Counties at 6½ cents for steers and 5 cents for cows f. o. b. ranch, and in Siskiyou County at 6½ cents for steers weighing approximately 1100 pounds and not extra good. Additional sales have been made in Siskiyou County for somewhat better steers at 6¾ cents f. o. b. ranch. Sales in Alameda and Stanislaus Counties are reported at 6¾ cents for steers and 5¼ cents for cows f. o. b. ranch, although these cattle were not really prime.

The Los Angeles market reports additional sales at 6½ to 6¾ at the ranch in considerable numbers with several sales as high as 7 cents f. o. b. ranch for choice grass fat cattle. The Los Angeles market remains strongest for veal, 8½ to 9 cents being paid in the country.

Both the San Francisco and Los Angeles markets report an increase in consumption of all meats, due to opening of schools. Dressed beef remains steady to strong.

The railroad strike situation has been sufficiently cleaned up so that railroad officials advise us that there will be no difficulty in moving cattle within the state. Use your association to secure cars and good runs for your cattle being shipped to market.

The supply of fat cattle in the state continues to be short, and buyers are agreed that the supply will continue short even with the supply of cattle coming from high summer ranges.

A meeting of cattlemen will be held during the state fair at Sacramento on Friday morning, September 8, at ten o'clock, in the main building. Plan to attend the state fair and the cattlemen's meeting.—R. M. Hagen, Secretary.

## SNAPPY NOTES ON THE LIVESTOCK MARKET

Any error herein is unintentional and subject to correction the following week. This summary is assembled from the best sources obtainable, and both producers and packers can assist by reporting actual sales or buys, giving names, dates and facts, and we will, if requested, withhold names. All we want is fact and a fair deal and correct information for the producers. Address A. L. Spellmeyer, care California Cultivator, 317 Central Avenue, Los Angeles. The Cultivator reaches over 40,000 producing farmers and livestock men.

* * *

General offers are made on a basis of 6 cents for steers and 4½ for cows that are fat, with some buys on a 6.50 basis for medium weight steers, and priced f. o. b. range Southern and Central California.

The demand is for heavy steers. The island steers are bringing a 7.45 price delivered Los Angeles, and they have good ones. A contract is rumored of 7 cents, f. o. b. Kern County for choice steers, and small lots sales of medium steers have been made on a 5 cent basis near Los Angeles. Rumor states one lot of choice fed steers that will finish in Los Angeles in September is held at 8 cents.

The lamb prices are reported to average 9.50 f. o. b. ranges, but sales have been made as low as 8 and as high as 10 f. o. b. Arizona and as high as $7 per head on Arizona lamb contracts, though feeder lambs f. o. b., Arizona have been contracted by the tens of thousands at 10.50 strong, f. o. b. shipping points, to go to Colorado.

Swine are rather weak around the 10.50 Los Angeles mark, but there is an unfilled demand for volume at those prices.

Carcass prices show some adjustment, with lambs anywhere from 18 to 24 to hard buyers and up to 25 and 27 in other districts. Beef carcass price, especially cow beef, is being cut as low as ten cents, and the intention of grouped cattlemen is to force up this small lot bargain bought cattle, which permits such carcass offering. The volume killer cannot buy 8 cent steers unless a fair carcass price is maintained.

There is a strong feeder demand for steers that will cost five cents delivered to a range. The small lot low beef prices are delaying contracts for feeders.

**Arizona**

Range is good and rains have been plentiful in Arizona. David Babbitt states northern Arizona is a garden spot now. Gaddis says the Kingman range is well soaked and in fine shape. Adolph Schuster says the Holbrook country has had fine rains. Marteny states that southern Arizona will have some beef this fall. Lamb crops in Arizona have been fair. One outfit has 9,000 lambs from 12,000 ewe stock, or 75 per cent. The lambs will go at 65 pound average, and they are offered 10.50 f. o. b. for the feeder end. The Schuster lambs contracted for 10.50 Holbrook and will probably go close to 55 pounds.

Arizona prices on cattle figure generally $25 for fall delivery yearling steers, $35 for twos and $45 for threes, or 5 cents f. o. b. delivery point by weight. The mountain men are taking 10,000 steers locally in Arizona from the valley men and are not yet filled though they have been offering a slight reduction under the $25 yearling price asked. Over 5000 steers went to Flagstaff ranges already. There will be about 25 per cent of the usual number of large steers offered each year from northern Arizona, and the beef proportion will be large, and very few will reach this market as feeders from that source. If any margin exists they will probably be fed out in Imperial or here by the owners. Southern Arizona will have some fat cattle in light steers it is claimed. They are held at a head price that about equals 6 cents f. o. b. Arizona, and several thousand are now offered for contract for fall delivery.

**New Mexico**

In some parts at this writing the New Mexico livestock situation is very serious, for the drouth persists, only broken by inadequate showers. J. B. Herndon, president of a large bank of Albuquerque, worn out with his intensive efforts in behalf of the livestock men, has been recuperating in California, and though not fully recovered is returning to New Mexico. Mr. Herndon is known as a "white" banker and has secured through war finance and other sources more than nine millions for the New Mexico livestock men. Without his effort New Mexico conditions would be more serious than they are now.

New Mexico feeder lambs have been contracted up to 11.50. They will run light, and are subject to less freight to Colorado hence the higher price over Arizonas.

New Mexico cattle are held at $25 for yearling steers, $35 for twos and $45 for threes. They are light and generally not in condition to sell by weight. There are bargains offered in stock cattle in the dry districts. One New Mexico cattle man is offering 2000 steers at $34 for twos and $45 for threes.

The general calf crops in both Arizona and New Mexico are light this year. Arizona with good feed probably has a 150,000 1922 calf crop as compared to a 400,000 former average. The New Mexico calf crop is estimated by one man at 10 per cent this year, with the New Mexico lamb crop at 25 per cent and the breeding sheep loss at 20 per cent. All this must indicate to a blind man a certain shortage next year in Arizona yearlings and New Mexico cattle and sheep.—A. L. Spellmeyer, August 21.

### WEATHER REPORT

## FINE POULTRY AND LIVESTOCK SHOW AT PETALUMA

The Sonoma-Marin Counties Fair, which was transferred from Cotati to Petaluma this year, was a decided success with Petaluma poultry its big feature.

The accommodations were first class and the attendance large.

The poultry was judged by Prof. James E. Rice of Cornell University, and Prof. J. E. Dougherty of the U. of C., strictly on a utility basis. This is the first show of this kind on the coast and proved very popular. Over 1500 birds were entered by 90 breeders and all were White Leghorns for which Petaluma is famous.

The livestock show was made up principally of dairy cattle and hogs. A. B. Humphrey of Escalon was one of the big exhibitors with Guernsey cattle and Berkshire hogs. Dr. Summerfield showed Tamworth hogs and A. Brieshoni Hampshires. A number of local men showed Duroc hogs, Holstein and Jersey cattle. The Ayrshire show numbered 30 head, mostly from the La Baron herd at Valley Ford. T. T. Harrison of Santa Rosa showed a good herd of dairy Shorthorns. Prof. E. H. Hughes of Davis made the awards on cattle and hogs.

## FUSARIUM TUBER ROT

Circular 214 on fusarium tuber rot of potatoes has just been announced by the department of agriculture. It treats of the different forms in which the disease appears under different soil and climatic conditions and should be of interest to all commercial growers of potatoes. Copies of the circular may be obtained by addressing Department of Agriculture, Washington, D. C.

The soils of practically all the potato growing regions of the country are infested with species of fusarium which cause tuber rot. These fusaria are closely related molds or fungi, and the disease takes different forms under different conditions of soil and climate. The same fungi also cause a disease of the plant known as fusarium blight or wilt.

Under storage and transit conditions powdery dry rot is the most common fusarium tuber rot in the western states. Jelly end rot, which predominates in long tubers of the Burbank type, and black field rot, which is especially severe in the Idaho Rural variety, are other western types of the disease. The mushy, leaky, grayish type of the rot is predominantly a southern disease. The blight or wilt occurs only in the warmer potato sections. It does not occur abundantly, if at all, in the earliest Florida crop, or in such cool districts as Maine or Oregon.

With the exception of crop rotation, no effective measures are known for the control of types of tuber rot that are primarily field diseases. However, there are a number of practices that help to reduce losses. It is desirable to use seed from plants free from the blight. Crop rotation and good culture are recommended. In the west losses by blight are avoided to some extent by planting whole seed.

The loss that occurs after harvesting may be cut down by careful handling during and after digging to avoid cuts and bruises. Potatoes should not be handled as if they were stones. Before storing, diseased, frozen, or badly bruised tubers should be culled out. Some storage and transit types of the disease may be controlled by keeping the potatoes in a dry place at a temperature between 32 and 40 degrees Fahrenheit.

## HONESTY IN CALIFORNIA TRADE NAMES

Not long ago the federal trade commission handed down a ruling in the case of a New England textile manufacturer, forbidding the use of the name "wool" or other words signifying wool for goods of which the principal ingredient was cotton or anything else other than wool. A decision of somewhat similar character has been given by a New York court in the case of a jeweler who sold as "sterling" a belt buckle not made entirely of silver. The New York judge rules that when the word "sterling" is stamped upon an article all parts of the article so stamped must contain at least .925 pure silver. The same general principle will shortly be applied to everything bearing as part of its name or trademark the magic word "California."

Factories distributing dairy products, growers and shippers of fresh fruit, melons, onions, lettuce, celery and other vegetables, sun dried and dehydrated fruit establishments should maintain the agricultural integrity of "California" by seeing that their respective products live up to implied guarantees and representations.

Study the state standardization laws where such apply to your products and live up to them in every detail. You will then not only maintain the excellent standard of California's offerings but also benefit yourself in a financial way.

## MILDEW OF ROSES

When mildew attacks bush roses in the open garden it will not do to say much about proper circulation of air, but examples are known of climbing sorts that mildewed on buildings and which were freed of the trouble, without moving the roots, by placing the plant on a trellis, free from the house, so air could circulate freely on all sides.

Sulphur fungicides are best for mildewed roses—lime-sulphur, potassium sulphide, dilute sulphuric acid (1-1,000), all are used as liquid sprays, but Prof. L. M. Massey, plant pathologist at Cornell University says dust sprays are better. He advises 90 parts sulphur to ten parts arsenate of lead. California farmers use much Bordeaux mixture and should try it on the rose bushes for a 5-5-50 mixture holds all mildews under fairly good control.

Keep seed pods off all plants if you would have the best development.

# For the Woman on the Farm

## *Chevrolet Four Passenger Coupé*

**$840** *f. o. b. Flint, Mich.*

Every farm should have two cars.

The farm car—usually an open touring model, is used for carrying milk cans, merchandise, etc., and is seldom in condition for going to church, shopping trips to town, or for making calls in the neighborhood.

Moreover, the farm family with only one car is at a great disadvantage. As a rule the family have disposed of their driving horse, so when the farmer is using the one car, the women and the children of the family must stay at home.

The New Superior Chevrolet 4-passenger Coupé is ideally suited to overcome these conditions. It is a splendid, all-year, woman's car for the small farm family. It has fixed seats for three and a folding fourth seat.

For a larger family, the New Superior Model Chevrolet 5-passenger Sedan is recommended.

Both of these cars have Fisher bodies, beautiful in line, finish, upholstery and interior appointments. The mechanical equipment is the same that has given the New Superior Chevrolet line such an excellent reputation and first place in the sale of standard fully equipped cars.

This Chevrolet Coupé can be easily operated by any woman and has a remarkably low cost of operation and upkeep.

## Chevrolet Invites Comparison Because Comparisons Sell Chevrolet

Consider What Chevrolet Equipment Means:

*Standard Rear Axle Construction. The new Superior Chevrolet has the strong, quiet, Spiral Bevel Gear Axle that "stands the gaff" without breaking.*

*Standard Transmission*—three speeds forward and one reverse.

*Standard Braking System*—foot service brake, hand emergency brake.

*Standard Electrical System:* Starter, storage battery, Remy ignition, electric lights front and rear on battery circuit.

*Standard Cooling System*—pump circulation, large, honey-comb radiator and fan. This means a cool, efficient engine, saving gasoline and oil and ensuring driving comfort.

*Standard Instrument Board,* containing speedometer, ammeter, oil pressure gauge, lighting and starting switch and choke pull.

*Standard Type of Carburetor,* with exhaust heater—one reason why you get most miles per gallon of gasoline with a Chevrolet.

*Powerful Valve-In-Head Motor.* The same type as used in successful cars selling at much higher prices.

*Demountable Rims*—extra rim on rear. No trouble to change tires on a Chevrolet.

*Many Other Advantages* which will be noticed on inspection, comparison and demonstration.

***Investigate the Difference Before You Buy***

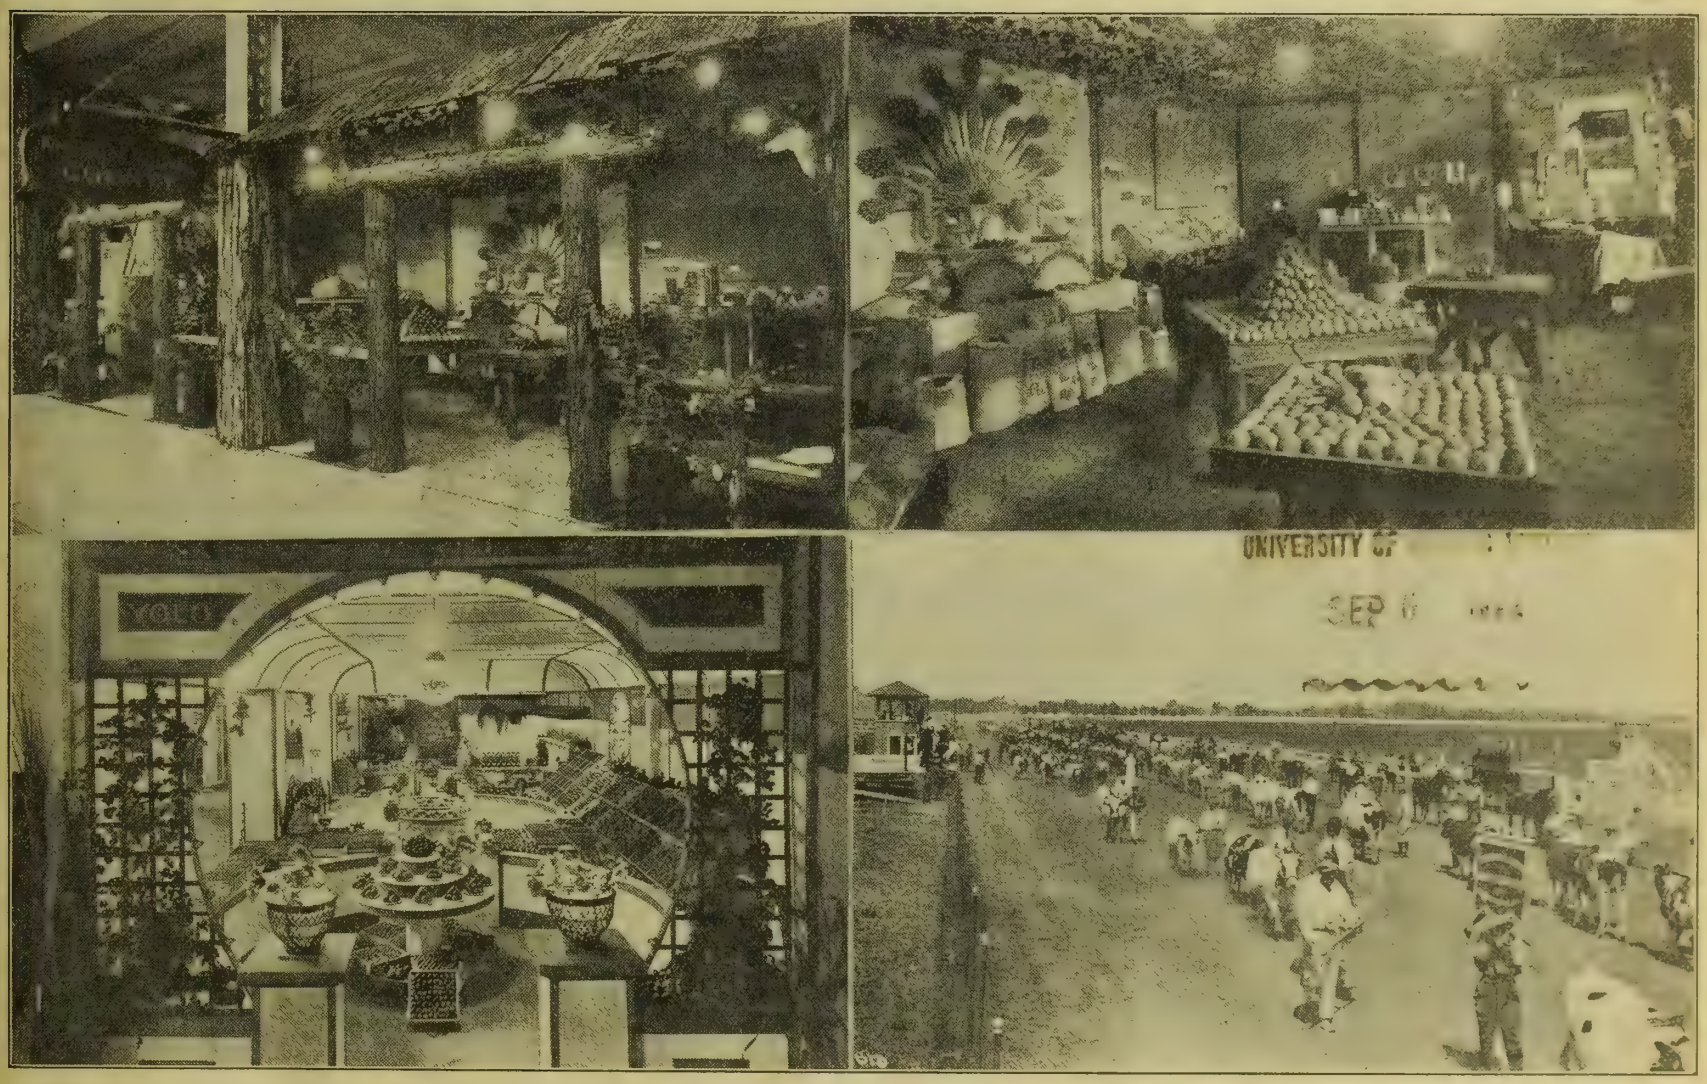
## Exhibits at Former State Fairs at Sacramento



Three of the scenes shown above were in the horticultural building, and the fourth, or lower right hand photograph, was taken on a Thursday morning when the governor comes out and sees the million dollar livestock parade. It may be noted that there are four lines on the track at the time the photograph was taken. The Ayrshires are coming up in the foreground, the Holsteins are marching down next near the center, the drafters are coming up over near the fence, while the ponies, tandems and fourinhands are going down on the fourth line. A visit to the state fair gives a start in a fairly liberal education.

# The State Fair From an Educational Standpoint

By M. C. Holman

WITH the opening of the state fair on Saturday, September 2, California again assembles the most luscious fruit from her orchards, vegetables from her gardens, the prize winners from her livestock pens and products from her great factories. Visitors will have an opportunity to view some splendid racing, which is, to a limited extent, a revival of the olden times when the turf was the vortex of sporting activities. There are side shows full of wonders brought from the far corners of the earth, and one can find much amusement in taking a peek at the seeming impossibilities of Nature's work.

But the state fair is vastly more than the fluttering of colored banners, the playing of bands, and amusement features; it is an educational institution replete with courses fully illustrated and diagramed for your observation. The man who goes to the state fair solelly for the purpose of having a good time fails to get the great lesson for which the agricultural show was instituted and for which it is maintained.

There are so many and such varied educational features that the visitor may spend three or four days profitably, making a careful study and analysis of those things which have interested him on the farm and which have influenced his crop for better or for worse.

The exhibit of the University of California is always interesting and can well be given very thoughtful consideration. The splendid display of rodent destruction merits careful study. Whether one is using trap, carbon bisulphide or other means of extermination, one cannot fail to gain valuable information through the actual illustration of the various methods which have been successfully employed.

Fertilization, with examples of methods of proper application of various fertilizers, should be of interest to everyone engaged in the raising of crops.

In the big power-on-the-farm tent the various tractors will be shown with their working parts exposed, giving the operating story of the machinery through actual illustration, and competent demonstrators are always on hand with full information relative to their respective tractors.

One of the main features in connection with the tractor tent is the lecture room, conducted by Prof. L. J. Fletcher, of the engineering department of the University of California. Prof. Fletcher and his corps of assistants lecture upon the care and operation of every part of the tractor and are always glad to answer any question relative to troubles which may arise and the methods employed for their elimination. These lectures include repair of broken parts, and proper adjustment of the delicate mechanism that enables the tractor to properly render the service for which it was built. Anyone who uses a tractor will find great benefit from these lectures and a day can profitably be spent in the lecture tent.

Near the tractor tent is the great dairy barn where milking machines are in almost constant operation. Sanitary barn equipment is used exclusively and the construction, benefit, and operation of this modern equipment can be carefully noted and studied.

Much use is made of electricity on the farm, and those who are not connected with the main power lines of California's big supplying stations will be interested in observing the various home lighting plants which are on display. These lighting plants offer tremendous convenience to the farm home that is remote from available service. Different methods of producing light and generating power may be studied and can be fully explained while one is on the ground.

Several types of silos are erected at various points of vantage, and the relative value of concrete and wood as silo material may be advantageously considered together with approximate cost, durability and capacity of a given size.

The big agricultural building is the center of attraction. This building contains splendid exhibits from various counties, chambers of commerce and private owners, and whether one is interested in agriculture, horticulture or mining, the exhibits cannot fail to arrest one's attention. The gallery is filled with splendid pictures showing the danger from and proper disposition of refuse, the treatment of various diseases of cattle, poultry, hogs, horses and sheep, the proper handling of milk, soil analysis, pruning of trees and vines, blasting of stumps, together with illustrations showing hundreds of improvements which go to make the agricultural home a prettier place and a better place to live. As a stimulant to the production of bigger and better fruit and vegetables the agricultural building shows many striking examples of what can be done through proper selection, cultivation and care.

The educational building is filled with splendid exhibits of the work done by children in the graded schools of California. It is with considerable pleasure that one views these splendid achievements and realizes that little hands, under the guidance of patient and persevering instructors, are able to produce such splendid art work, such attractive needlework and such accurate fabrications from wood. The products of our Indian school make us know that the state is doing wonderful work for the Redmen. The exhibits of the deaf, dumb and blind show what results can be accomplished by these greatly handicapped children. So many examples of technical skill are on display that one may profitably spend half a day in the educational building.

The woman's building is particularly interesting from an educational standpoint. The work of women from all over the state is assembled within its walls. It tells a story of the splendid work that women are doing for the beautification and convenience of the modern home. Practical utility holds a dominant place in the displays. The art gallery is well stocked with splendid pictures which may be studied to advantage.

Every modern agriculturist is interested in automobiles. At the state fair one has an opportunity of viewing nearly all of the popular models in various styles, for they are assembled under one mammoth roof near the entrance to the grounds. Their various points of advantage may be observed through the operation of the exposed models, and one whose mechanical inclination has been encouraged will find much to interest him in this exhibit.

The livestock department is always one of the main features of the state fair and this year the various departments bid fair to contain a greater number of separate entries than they have ever had before. It is most in-

(Continued on Page 246)

# A Hemet Laying House

By Jean A. Koethen

NEARLY every poultry community in Southern California has its own type of laying house. In Pomona we see many no-yard houses of the Weeks type, long and narrow, with the birds in small flocks. At Inglewood no-yard houses holding 75 to 100 hens each are being tried out. In the San Fernando Valley district the hens are in large flocks but the houses, instead of being all open front, are closed nearly two-thirds of the distance from ground to roof. Around Riverside they are mostly open in front with fairly large flocks.

In Hemet we found a house different from any of the above. It is on the ranch of H. S. Brown in the Fruitvale district, and was copied, we were told, from another in the same district. This house is 50 feet by 24, with gable in the middle and an alley dividing the house from end to end. On each side of the alley are five sections, each about 10 feet square and designed to hold 50 hens. This makes 750 hens to the house when all the sections are filled.

The floor is cement. Each section, instead of being wired in in regular-fashion, is boarded up solid except for a large window and a low door through which the birds reach the outside run. Additional ventilation is supplied through transoms at each end of the alley and also through the alley doors which may be left open or shut as occasion demands. Feed hoppers, nest boxes, water fountains and green feeders are all arranged along the alley so that it is necessary to enter the sections only for cleaning. On cleaning days a small truck is run along the alley and the droppings are quickly removed.

A Double Laying House

Note the window and door for each inside run. Liberal circulation of air is provided by end doors and transoms.

Mr. and Mrs. Brown plan to keep 1000 chickens regularly in their two houses. They have now about 300 three year old hens which in May were laying 80 per cent, a remarkable performance. One hundred fifty yearlings have done nearly as well, and a small pen of R. I. Reds averaged 290 eggs last year.

Chickens are only a side line with the Browns, who have 40 acres planted to fruit, but they believe that aside from the income from eggs 1,000 hens will be invaluable as producers of fertilizer.

Cleanliness is the keynote of the care of the flock. Droppings are removed daily, and the entire house is sprayed once a week. Every two weeks the litter in the scratching pens is changed and the old litter used on the orchard.

# Agricultural News Notes of the Pacific Coast

## Northern California

The state fair at Sacramento, September 2-11.

Petaluma shipped three carloads of eggs to New York August 2.

Two cars of Wickson plums were sent from Lincoln, Placer County, to Havana.

Threshing of horse beans has commenced about Redwood City, San Mateo County.

The Tehama County peach growers contest has been closed. Twenty-four entries were made.

Date of bond election on the Sutter-Butte by-pass assessment has been changed to September 23.

One million cases of pears valued at $4,000,000 were produced this season in Sacramento County.

For the week ending August 9 shipments of eggs from San Francisco to Hawaii totaled 40,000 dozen.

The chamber of commerce of El Dorado County has been conducting plum and pear packing schools.

Sheepmen are encouraged over upward trend of wool prices. Modoc lambs are averaging seven dollars a head.

Miss Anne Polak has been appointed home demonstration agent for Glenn County, and has already assumed her duties.

The Butte County Beekeepers Association is asking that a bee school be conducted by the state university at Chico this fall.

The annual meeting of the California Holstein-Friesian Association will be held at the state fair grounds at Sacramento, September 4.

The section of the Tahoe-Ukiah highway, now in course of construction from Ukiah to Upper Lake, will be completed by the end of this year.

Due to favorable weather conditions most of the rice fields in the Biggs section are two weeks ahead of the crop of last year on a corresponding date.

Reforestation measures that will mean that the timber resources of Lassen County will never be exhausted are being carried out by the Fruitgrowers Supply Company at Susanville.

The second annual convention of the Placer County fruit growers is to be held at Auburn, October 4 and 5. Attention of the convention will be directed to subjects of interest to fruit growers in Placer County.

The value of cargoes carried on the Sacramento river during the year 1921 was $52,092,000 and the tonnage was 976,596, according to the report issued by Major U. S. Grant of the United States army, engineers division.

Preliminary surveys by the city engineering department show it is feasible to develop a hydro-electric system for Sacramento, on Silver Creek, upon which the city authorities have filed claims. Figures on construction costs are now being compiled.

The South Shore Port Company has just completed the dredging of a channel two miles in length from the south end of San Francisco Bay to Kingsport, otherwise known as Port Sunnyvale. The opening of this port is expected to prove a boon to shippers and importers of the Santa Clara Valley.

## Central California

Kern County has decided not to hold a fair this fall.

The Giant Forest Park will remain open until October 10.

There is talk of establishing a lettuce packing plant at Salinas.

Tulare County shipped out 61 carloads of cantaloupes this season.

California Farm Bureau Exchange closed its grain pool, September 1.

The first California Citrus Institute will be held at Lindsay, September 6.

Grape growers are urged to test their raisin grapes for sugar content before picking.

Tehachapi pear festival will be held September 4; Rio Bravo community fair, September 9.

The California Almond Growers Exchange is expected to set prices about September 10.

Stocks of beans in warehouses in California, August 1 were 262,980 bags, one-third supply on hand last year at same date.

The Cooperative Cannery at Modesto expects to handle a big yield of Bartlett pears from the Oakdale district.

California Olive Growers is planning an advertising campaign among retail grocers of the East to make known the value of ripe olives.

Difficulty in obtaining box shook is worrying grape growers in the Manteca section. Only about 30 per cent of the shook needed has been obtainable.

First National Bank of Porterville has offered a prize of $25 to the member of the farm bureau who has the best kept roadside at the end of the year.

Work is being rushed on the new packing house for the Richgrove-Jasmin Citrus Association which will handle fruit of growers in southern Tulare and northern Kern.

Water Master Kaupke of the Kings River is making plans to extend the snow survey farther into the Sierra Nevada to secure accurate data on the whole Kings River watershed.

Inyo County sheep raisers report getting good prices for their sheep. Breeding ewes are now bringing $10 to $12 a head, with many sales reported at $11. Sheepmen expect that the price will go to $16 this year.

Following the lifting of embargos on the Santa Fe railroad, fruit movement from the San Joaquin Valley is rapidly approaching normal. Cool weather has made it possible for the growers to leave their fruit in the orchards and vineyards.

The Pine Flat project is rapidly nearing realization. Seven irrigation districts have now been formed and petitions for the enlarged district are being circulated throughout Fresno, Kings and Tulare Counties. The state engineer's office is preparing to make preliminary borings for the proposed dam.

Frank L. Blain of Exeter has been elected president of the California Cooperative Canneries. The three big plants of the California Cooperative Canneries at San Jose, Visalia and Modesto, are operating to full capacity on peacnes and pears and have completed the largest pack of apricots in the history of the company.

## Southern California

Imperial County has given up holding its fair this year.

Lima bean cutting has commenced in the Oxnard section.

The Oxnard sugar factory began the season's run, August 19.

The Orange County fair will be held at Santa Ana, September 27-30.

California Lima Bean Growers Association is selling beans at $6.25.

Bean dealers of the state held barbecue picnic at Oxnard, August 26.

The walnut harvest will be a week or ten days later this year than usual.

The annual fiesta at the Soboba Indian reservation will be held, September 3-10.

Ventura County bean growers would like to see some foggy weather for the sake of their beans.

A Moorpark, Ventura County, farmer has had a 25 horsepower electric motor stolen from his pump.

Imperial Valley growers shipped this season 12,198 carloads of cantaloupes, the season lasting from May 15 to July 24.

S. P. Nealey of Rialto says the honey crop is high grade and abundant, marketing being now the problem.

Frank B. Astroth, representative of the American Jersey Cattle Club, has been visiting Jersey herds in Riverside County.

Officers of the Los Angeles County farm adviser have been moved from court house to next building south of hall of records.

The management of the Ventura County fair has excluded all gambling features from exhibits and shows on the grounds.

New equipment for all forest rangers in the Angeles forest reserve will include portable telephones attached to the backs of the patrolmen.

The annual meeting of the Oxnard Citrus Association was held at the warehouse at Hueneme, August 4. Reorganization plans were considered.

The Mojave Valley Fruit Growers Association has decided not to pack or ship fruits this season because of inability to build its own packing house this year.

The alfalfa seed crop is practically all harvested in the Bard district of Imperial County. Cotton growers are organizing to handle picking and ginning of their crop.

Manager F. A. Wolz of the Imperial Farm Bureau Exchange reports getting better than Los Angeles prices for barley sold directly in San Bernardino and Los Angeles Counties.

Charges are made that bean buyers are attempting to break the market by making sales among themselves for November delivery at prices of a dollar or more under association prices.

Potato growers of Southern California met at Los Angeles, August 21 to consider marketing problems and appoint a committee to look into the matter of storage till better prices can be secured.

A 30,000 ton crop of walnuts for California is estimated by officials of the California Walnut Growers Association. This is 50 per cent over last year's. Sizes promise to be excellent and quality better than usual.

## The Coast and General

The Colorado agricultural college, Fort Collins, will open September 13.

Hop growers of Washington, have decided to pay pickers $1.25 per box.

Increasing amounts of condensed milk are being manufactured in Brazil.

Walla Walla County, Washington, shows a general average of 20 bushels of wheat per acre.

The Texas honey crop is estimated at less than one-third of normal owing to drouth conditions

The Smyrna fig crop for 1922 will be 20 per cent larger than last year and of much better quality.

Dairymen of Clarke County, Washington, have organized a cooperative marketing association.

The majority of honey producing sections in the Rocky Mountain states report less than average yields.

Continued dry weather in Oregon will result in considerable reduction of apple, pear and prune crops.

The commercial apple crop of Washington this year is estimated at 33,400,000 barrels against 21,000,000 last year.

Mississippi has been growing as a tomato producer. This past season shipments amounted to approximately 3,450 cars.

Florida expects to begin shipping oranges by the first of September. Commercial output of all citrus fruits is now estimated at from 12 to 15 million boxes.

U. S. Consul Robertson at Shanghai reports that over 11,000,000 fresh eggs came in from China last year besides millions of pounds of dried eggs and egg products.

Manager Lea of the Oregon Cooperative Growers Association says that Oregon banks, which one year ago hesitated to make loans to members, are now offering money.

Washington peach growers were forced to lower their prices for Elbertas because of transportation tieup. They had been asking 75 cents but dropped to 60 and 52½.

Florida watermelons were widely distributed this season. Some shipments went as far as San Francisco, Portland, Seattle, Vancouver, B. C., and other Canadian points.

A writer to the Arizona Cattleman and Farmer says: "We have just had 'Melon Week,' eat a melon a day and save the farmers ten thousand dollars. Why not have "Beef Week," eat a beef a day and save the cattlemen $100,000?"

Berries grown in the Puget Sound region of the Northwest are served on breakfast tables in Chicago 80 hours after being picked as a result of the establishment of a special express refrigerator train service operating on passenger schedule between the Pacific Northwest and Chicago.

Twenty million acres of land in Alberta, Canada, are to be placed under irrigation by the Dominion government. An artificial canal connecting the North Saskatchewan river and Sullivan Lake will be 125 miles in length while a natural channel of 125 miles will be utilized, making the entire length connecting the two bodies 250 miles.

# Pear Drying

By L. C. Barnard, Division of Pomology, U. C.

THE Bartlett pear is the variety grown in greatest abundance and it is also the principal variety used for drying. Good, close grained pears of good size are required, if the best dried product is to be secured.

### Ratio of Green to Dry Weight

In Lake County it takes about 4½ or 5 pounds of green fruit to made one pound dried. In other sections of the state it takes from 5 to 7 pounds of green fruit to make one pound of dried. Perhaps 6 to 1 is a fair average.

### Yields Per Acre

Yields vary from ¾ to 1½ tons dried per acre. One ton per acre is a good average.

### Harvesting and Handling Methods

Pears are practically all hand picked, and only the best of the windfalls are picked from the ground. Some growers prefer canvas bags and others pails for picking. It generally takes two and sometimes three pickings to properly harvest the crop.

Pears are picked when they are hard ripe, or when the stem separates readily from the spur. They are at this time too green for immediate curing and must be given time to ripen. The pears are put in field boxes and then hauled in to the drying plant where they are culled and graded. Wormy, sunburned, bruised and blemished fruit is sorted out and placed by itself, as it ripens faster. The remaining good fruit is generally roughly graded on the basis of size, each size being placed by itself. Some growers do not size the fruit previous to cutting, but pick out the small fruit when it is partly dry on the trays. The small fruit dries much more quickly than the larger, and if it is not sorted out it becomes too dry by the time the larger fruit is at the right stage of dryness. Better work is done, however, when the sorting out is done previous to cutting the fruit, then all the work of sorting out the small sizes from the trays is saved.

If the grower has enough boxes it is best to allow the fruit to ripen in the boxes, keeping each day's picking of fruit separate. In case there are not enough boxes, the fruit is allowed to ripen in bins in a shed, care being used not to pile the fruit too deep, nor to mix the pickings of different days. If pickings on different days were mixed, the late fruit would be too green when the first day's picking was ready to be cut. If the fruit is allowed to ripen in bins it is well to cover it with canvas sheets which keep the temperature more uniform during the day and night, thereby hastening the ripening process. In case the grower has neither enough boxes nor shed room, straw may be spread 6 inches deep in the shade of trees and the fruit carefully piled in rows about six inches deep and one foot wide, and 6 or 8 inches of straw placed on top of the fruit. The wormy and sunburned fruit will be ready to cut in from five to seven days and the remainder in from a week to ten days. To secure the best results and obtain the maximum weight of dried product, the fruit should not be allowed to become too ripe before being cut.

### Cutting

When the fruit is ripe, but not overripe, the pears are cut into halves lengthwise. The best product results if the stem is pulled out and the core and calyx are cut out. Some growers remove only the stem, while others only the stem and calyx.

### Sulphuring

There is less uniformity in the methods, time and amount of sulphuring for pears than for probably any other product dried. The amount and time of sulphuring generally is considerably greater than that for other fruits. A high grade product, as demanded by the trade, is nearly translucent when cured, and in order to secure this translucency long continued sulphuring must be given.

The practice in Lake County is to put the fruit in the sulphur house as soon after it is cut as possible and light the first charge of four or five pounds of sulphur. Early next morning another charge of four or five pounds is put in the house and lighted. The third and last charge of four or five pounds is put in on the evening of the same day. On the second day, 48 hours after the fruit is placed in the sulphur house, it is taken out and spread on the dry ground.

The amount of sulphur burned probably ranges between 12 to 20 pounds per green ton and the time of sulphuring 20 to 48 hours, depending on condition of sulphur house and fruit.

### Curing

The condition of the fruit, amount of sulphuring, and the weather determine very largely how long the fruit should be exposed to the sun and how long it should cure in the stack. Small, very ripe fruit requires less exposure to the sun. Fruit which has been sulphured 48 hours should not be exposed to the sun's rays as long as fruit sulphured 24 hours or less. In any case, the fruit should not be exposed too long to the sun or it will be discolored.

In Lake County pears are exposed to the sun for about five hours if the weather is very hot, but usually they are exposed for from one to two days. Principal curing is in the stack and is from one to four weeks.

Sometimes the trays are stacked on a slant, one end a foot higher than the other. The top of the stack is then covered with a roof tray. The roof tray has the same size bottom as the others. The roof is made of shakes laid roof fashion, and often covered with roofing paper. If stacks are covered with a roof or cover tray, they may be exposed to the rain without damage to the fruit. Some growers have sheds which they use to stack the trays in in case it rains. In the open, the stacks are about 20 trays high. It is a good plan to place a one-inch strip between each two trays or allow the ends of alternate trays to project a few inches to insure aeration. The stacks should be so placed that the prevailing wind will have the greatest opportunity to hasten the curing.

Curing is said to be complete when the fruit is rubbery or leathery to the touch, but not mushy. Some growers allow a handful of fruit to roll across the tray, and if the fruit rattles it is called cured.

As soon as the fruit is sufficiently cured on the trays it is usually stored in bins, boxes or on a good clean floor of a shed. The fruit should be placed so that air may circulate around it if it is to be stored for any length of time. If not, some of the fruit may mold.

# This Month in the Vegetable Garden

## Northern California

By A. R. Gould

THIS is a busy month as there are many things to harvest. All crops stored for the winter must be in perfect condition and kept in a dry place. Tomatoes, turnips, carrots, etc. may be preserved by the evaporation method, while onions, cucumbers, etc. may be pickled in vinegar. Dry beans and peas should be collected and stored in bags or barrels. Winter varieties of squash and pumpkins may be kept in the cellar but should not be cut until thoroughly mature.

It is also important to keep a proper record of all crops as harvested, making a note of the location, in the plot where grown, as when using the rotational system of cropping this information is essential. Dig plots as soon as cleared, trenching them deeply with manure and where necessary use slacked lime to work in the surface. Poultry manure must be used very sparingly as it is a powerful agent as also is rabbit manure.

### Leeks and Celery

These two useful crops will need feeding with liquid manure if they are to be brought to perfection, and this stimulant should be given twice a week. The plants must be blanched by covering with stiff paper or filling soil in trench. A dusting with arsenate of lead will prevent attack by insects.

### Kale and Brussels Sprouts

Plant out 18 inches apart in rows which should be three feet apart. Sturdy plants should be secured and kale planted extensively for poultry as it is very hardy. Water frequently until well established.

### Tomatoes

Remove all diseased fruits; if left on the vine they are liable to cause troube. Bury with quick lime. Avoid overhead watering as this will injure the flowers now about to set for late fruit. Where the foliage is too heavy some of it may be cut out to allow the fruits to ripen better.

### Beans

Make sowing of Broad Windsor, a hardy bean of excellent flavor, in rows two feet apart. Canadian Wonder, a dwarf green pod, may also be sown. Cultivate the ground thoroughly before sowing.

### Cauliflower

Sturdy plants should be put out in well manured soil 18 inches apart in the rows which should be 2 feet apart. Autumn Giant and Early Snowball are the best varieties.

### Corn

Dust the tassels of maturing cobs frequently with dry lead arsenate to destroy the corn worm which will otherwise play havoc. Irrigate late sown plots.

### Beets

Thin out those sown last month, leaving them six inches apart in the row.

### Parsley

Make sowing of Moss Curled for winter use, in rows or broadcast and later thin out.

### Parsnips

Sow Hollow Crown in well prepared ground in rows two feet apart. This is an excellent vegetable and should be more widely grown as it is very hardy and useful for winter use.

### Potatoes

The digging of this crop should be completed this month and the tubers stored in dry sand. Inspect them frequently to remove diseased or bruised tubers.

### Carrots

After the bean crop has been cleared off sow carrots. Danvers Half Long and Early Shorthorn are the best to sow now in rows 18 inches apart.

### Cabbage

On a well prepared border sow Savoy and Autumn King for planting out later. This plot may also be trenched with manure as it pays to fertilize heavily for cabbage. A dressing with lime will also be beneficial.

## Southern California

By D. F. Reichard

THIS is the time to get the early winter garden started. The one big thing is to have the ground to be planted or the seed bed in shape to properly germinate and grow the seed. This is only accomplished by having plenty of water in the soil and by having the soil properly worked.

To get enough water into the ground, on small plots set a sprinkler going, leaving it at least an hour to a place or on larger pieces of ground irrigate either by furrows run close together or by check flooding. Enough water should be put into the ground to put this top moisture down to the bottom moisture, which at this time of the year may be two or three feet down. After a couple of days the land wet as suggested will be ready for working. Dig it up to a depth of ten or twelve inches and thoroughly pulverize.

As winter vegetables are not vining plants it is better to plant them in rows. After getting the land nicely pulverized and level furrow it out, making the ridges about 12 or 15 inches across the top. When the ridges are made run water down the furrows; this will settle the ground as well as show where to sow the seeds on ridges. The seed should be sown a few days later just above where the water ran. After a few days irrigate again and as soon as the ground is dry enough cultivate lightly so as not to disturb the freshly germinating seeds.

Except in the absolutely frostless districts it is too late to put in the summer stuff like squash, cucumbers, melons and corn, and only in warm sections can beans be planted in the

### OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If among the more than 40,000 Cultivator's weekly circulation any fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

### EDITORIALETTES

The state fair which opens on the fair grounds Saturday morning of this week is the 68th state fair to be held in California. The fair will continue all of next week closing on Sunday night, September 10. The illustrations on the cover, taken at former fairs, give a slight indication of the beauty and utility to be seen and studied in Sacramento on those eight days.

* * *

The state fair is nothing if not educational. Of course there are some displays made purely for the purpose of making money. There are some features of the program for the purpose of inducing a great attendance and to swell the gate receipts; there are features encouraging the picnic or play-spell spirit, but with the fun and the merrymaking, the real foundation of the fair and the reason the state is lending financial aid is because of the educational opportunity. That this is appreciated by the management more fully than ever before is indicated by the elimination of the Teddy Bear gambling joints which have been features of the fair for many years. One year there were nearly a hundred of these tents or booths devoted to games of chance or "skill." The management promises this year that these first steps in gambling shall not be taught any more on the California state fair grounds. This is fortunate and a most commendable move. Many a taxpayer is becoming restive because of his money being used to educate youngsters, who attend the state fair, in first steps in gambling.

* * *

And educationally we may refer to the fact that the taxpayer gets an opportunity to see where some of his money goes by attending the state fair. Many departments of the state and federal governments make exhibits showing their activities in a way which enables even a casual visitor to form an idea as to the uses of moneys appropriated for those departments. For instance, at the last state fair Director Hecke and many of his department united in putting up exhibits in standardization, bureau of markets, rodent control, insects both beneficial and injurious, veterinary and other divisions of the animal husbandry bureau. These exhibits were of sufficient interest that hours could be spent with profit in the various booths. The sealer of weights and measures, the state harbor board, the federal bureau of forestry and almost innumerable other government activities all make educational exhibits.

* * *

The attendant at the fair who goes with the idea that an agricultural fair has become an exhibit of monstrous pumpkins and over-fed hogs has another lesson to learn when he attends the 68th annual California state fair.

### JAPANESE BEETLE

Southeastern Pennsylvania and western New Jersey, or a small portion of those two states comprising an area of a couple of hundred square miles, are threatened by the ravages of a recently discovered pest known as the Japanese beetle. Not only is this one section threatened, but from the rapidity with which it is now spreading all of the eastern United States is threatened. The destructiveness of the pest appears to be far greater than any other which has been introduced to this country. It seems to have a score or more of favorite host plants, and smart weed, nettles and others prove to be just as acceptable as fruit trees or field crops.

Pennsylvania and New Jersey authorities are issuing warnings to farmers, and investigations are being made as to how the spread of the pest may be brought under control. A few of the beetles on a leaf soon reduce it to a skeleton, and if they attack an apple tree they do it in such numbers that the insects may be gathered by the quart. One who has seen the pest in operation told of gathering the beetles in large double handfuls from a single apple.

It has been determined that this pest has been in New Jersey for the past dozen years but heretofore little was thought of it.

The federal horticultural board has much to its credit in preventing the entrance of other similar pests. This pest, with all the other major pests which have been introduced into this country, secured entrance before the present quarantine movement.

### AFIELD

Texas is an awfully big state. The other morning I wakened as my train was crossing the Sabine. A little later we breakfasted, a few hours later we lunched, then dined and slept, and all the time proceeding toward California on the Limited. Again we breakfasted, lunched and dined and we are still in the state of Texas. A thousand miles we have come since crossing the Sabine and leaving behind the rice fields, cypress swamps, turpentine forests, teams of six oxen hauling turpentined logs to the big saw mills, the pendant grass mosses on pine and live oak, the bayou and other characteristics of southeastern America, and we passed the oil fields, thousands of acres of cotton fields and are now whirling through the great plains of the Southwest where are the sage, yucca and cactus and the sunset, and the western boundary of Texas is still beyond. The land of the planter and his oxcart, the darkey and his pickanniny is left behind and the land of the rancher, the cowboy, the Mexican and his little brown skinned kids have come, and we still have the Rio Grande to cross.

As I consider some of the figures "of astronomical importance" concerning Texas there comes to my mind an incident during this same trip where three states in three minutes was possible. I had an early breakfast in Boston, took train for New York, where I lunched. It was but a few minutes after we left Boston until we rounded the hill on which stood the capitol of Rhode Island. A little later we were skirting Long Island Sound, and, as noted, lunched in York State. Yet with all their diminutiveness these states are important to the Union. Each is of the original 13, each is great in manufacturing, and in the early arrangement of things national these states granted to Texas the same right they had in the matter of representation and gave to Texas two members in the United States senate. The justice of this is rather startling when considered from the standpoint of area. Massachusetts has an area of 8,040 square miles, Connecticut 4,845, and Rhode Island 1,053, or a total for the three states of 13,938. Subtract these 13,938 square miles from the 265,780, which represents the area of Texas, and it doesn't make a dent in the great bulk of that state. Subtract the area of those three states from the one county of San Bernardino, California, and there are still left in that county a half dozen Rhode Islands. On a strictly area basis, proportionately with Rhode Island, Texas would have some three or four hundred senators. All of which means nothing and is more or less of foolishness yet it makes outstanding some recent events in the United States senate. Of these I will mention just one, the wool discussion in the tariff debate. The growers were appealing for the preservation of the wool industry. The agricultural bloc had worked nobly and secured some recognition. Western Democrats joined with Republicans and all worked to the end that a little protection was secured for the wool grower and—more for the wool manufacturer. But the consumer, the maker of wooden nutmegs, had his interests watched for too. The old time protectionists labored valiantly for manufacturing interests and they finally made the horrible discovery that a member of the United States senate who was working for protection on wool was actually a wool grower. Naturally committees were appointed, and investigation started which might involve and eliminate a wool grower from any participation in the effort to protect his own industry. In this discussion Texas, one of the greatest wool growing states of the Union, was represented by two men. Buyers of wool who wanted to buy it cheaply for the sake of great profits in manufacturing were represented by a great many senators, six of whom were from the little states of Massachusetts, Rhode Island and Connecticut, all combined with an area of one-twentieth that of Texas.

There is not the faintest hint of a suggestion for a change in methods of representation at Washington, but having spent a rather unprofitable hour in the gallery of the United States senate listening to Senator Walsh of Massachusetts endeavoring to hammer the life out of the wool schedule, I am reminded by these dreary hours over the plains of Texas of that event. Also I am now reminded by the Rio Grande over which we are just beginning to pass that I am still in Texas.

# Ripe Olives Return to Favor

By W. V. Cruess, Farm Products Laboratory, University of California

DURING the years 1920 and 1921 the sale of ripe olives in Eastern states was almost nil. Some of the Eastern wholesalers held over during these two years goods that they had purchased in California in 1920. The Eastern buying public apparently had lost its confidence in this product. The sale of green olives went merrily on and the green olive packers and dealers did very little to restore confidence in the California ripe olives. The California packers, however, did not lose confidence and during the past two years have spent large sums of money in advertising the California product and in operating their business at a loss. They did not lose confidence in the future and close up shop, except in two or three instances. It is probable, however, that these plants that did close their doors temporarily will again pack olives in the near future. At the present time the situation has changed definitely for the better. Most of the packers in California could clean out their entire 1922 pack in a few weeks time if they desired to do so. The demand is apparently rapidly increasing. Every effort is being made by the California Ripe Olive Association to spread the gospel of the ripe olive to the eastern consumers.

Mr. Shurtleff has been on the road continuously during the past several months for the association, demonstrating to grocers throughout the East the merits of the California product and calling the attention of the consumer to the California ripe olive. Mr. Shurtleff's efforts have been well rewarded by an increase in sales. In California the sale of ripe olives did not decrease markedly following the set-back of 1919, and it was the sale of olives in California that made it possible for the packers to continue in business.

The biggest factor, in the writer's estimation, which has led to a return of confidence in the California ripe olive has been the state board of health's ruling in establishing a safe sterilization of ripe olives. The board of health ruled that ripe olives offered for sale must be sterlized at 240 degrees Fahrenheit 40 minutes in retorts equipped with temperature recording devices. The board has further ruled that each batch of olives sterilized must be given a number and a record of sterilization made by the recording thermometer must be kept and numbered for the use of its inspectors. This temperature and time of sterilization has been religiously observed by the commercial packers. The packers, therefore, have had no hesistancy in going to the consumer with the statement that commercial packed California ripe olives are safe. The ruling of the board of health was made as a result of the investigations of Dr. E. C. Dickson of the Stanford Medical School and Dr. Meyer of the Hooper Medical Research Foundation of the University of California. When this temperature was first used commercially in 1919 and 1920 it was found that some of the olives softened badly. Investigations by the college of agriculture have proven, however, that softening could be avoided if all of the bitterness was removed from the olives in the pickling process by adequate lye solution. Softening is not very great and practically all of the commercial factories are producing a canned product that is very acceptable to the consumer.

### Bulk Sales of Olives

The board of health's ruling prohibits the sale of unsterlized olives. However, there is a certain quantity of olives marketed without sterilization. Dr. Meyers has recently proven that such olives stored in bulk without sterilization can develop botulinus poison. He is strongly of the opinion that the bulk sale of olives should not be continued. The canneries can take care of all the olives since the organization of the growers into the new olive association. This new association will erect plants if necessary and will cooperate with the California Ripe Olive Association to utilize all ripe olives in California. The real future of the olive business lies in developing a demand in the East for the commercial canned product. Bulk sales in California will never utilize any great proportion of the crop and in the writer's estimation will increase the danger of another outbreak of botulinus.

### New Standards

The California Ripe Olive Association is now obtaining data at their Los Angeles headquarters and through experiments being made by the writer at Berkeley, for the establishment of standards for ripe olives. The association has already adopted the rule that olives of dark brown or black color will be considered first quality and those of light brown second quality. They desire now to establish more definite size grades and standards for texture and flavor and other qualities. Such standards will materially assist in advertising and in establishing in the minds of the consuming public the relation of the different grades.

### The Future

As noted above, the writer is strongly of the opinion that the future of the ripe olive industry in California depends upon closer cooperation between the grower and packer and an effort to put on the market the best qualities of ripe olive possible We must stabilize the Eastern market and develop it to the fullest extent. The United States is consuming several times as many green olives as ripe Therefore, it can be readily seen that we have much room for increase of our output. No one should feel pessimistic about the future, provided we are extremely careful to exclude the invader Bacillus Botulinus that nearly wrecked the industry three years ago

If this one precaution is observed religiously and the present publicity campaign is maintained there is no doubt as to the future of the olive industry in this state. We have a natural monopoly—let us make the best of it.

### WHITE SAPOTES

A richly flavored subtropical fruit popular with a majority of those who taste it is the white sapote, the zapote blanca of the Mexicans, the Casimiroa edulis of the botanist. It is native of Mexico, and nearly all planted in the past are from seeds sent from that country. It is said the leaves have some medicinal value and consumption of the fruit induces sleep. Of late years a few of the best varieties have been budded on seedling stock and these select named varieties may be had from nurserymen and seed stores. The best two are the Maechtlen and the Harvey. The former comes from the ranch of Jacob Maechtlen, Covina, and the other was grown from a seed sent from Mexico to the late J. C. Harvey of Los Angeles.

# The Carob

By G. P. Rixford, United States Department of Agriculture

A FILLMORE subscriber in the Cultivator of August 12 asked for information regarding the carob tree, Ceratonia siliqua.

This tree is one of the most ancient in cultivation and figures in the Bible in connection with the prodigal son. According to Alphonse de Candolle in his "Origin of Cultivated Plants'" its original home was about the western coast of Asia Minor and Syria, and perhaps Tripoli. Its cultivation began in historical times, was diffused by Italy and Greece, and was carried west by the Arabs as far as Spain and Morocco.

Its pods are regarded as of great value in southern Europe and Northern Africa and are extensively used for stock feed, and when ground up are even used for feeding poultry. The late Dr. Aaronsohn, chief of the experiment station at Haifa in Palestine, told me that it was one of the chief exports of that country, thousands of tons being shipped to England and used as stock feed. He says that an acre of mature trees will yield a tonnage of pods equal to the yield of barley or oats if planted on the same area while in nutrients the pods are superior to oats and fully equal to barley. He gives the sugar content of the best varieties as high as 40 per cent and in some varieties even higher, and the protein content as high as 7 to 8 per cent. The analysis published by Riviere and Locoq gives a higher digestive coefficiency and nutritive value a little higher than oats. It is estimated that 147 kilos of carobs equal 100 kilos of wheat. (A kilo is nearly 2¼ pounds.

### First Introduction

The first introduction into the United States was by the patent office in 1854, and from Palestine in 1859. About 8000 plants, grown from seed in Washington, were distributed during the spring of 1860, mostly in the Southern states. Some of these plants found their way to California, as a number of old trees are growing in various parts of the state from San Diego in the south to Butte in the north. Several varieties were imported in June, 1911, from Valencia, Spain, and last spring a half dozen kinds from Spain, Italy, Greece and Palestine from the office of foreign seed and plant introduction of the United States department of agriculture. This shipment consisted of cuttings of many of the leading varieties grown in those counties, which are now being propagated at Chico, and other California points.

### Both Dioecious and Monoecious

The species is either dioecious or monoecious. All trees that I have seen in California are monoecious, although Dr. Aaronsohn asserts that the dioecious varieties give the most valuable pods. Therefore to produce these pods it would be necessary to plant trees as pollenizers with the females. Instead of planting male trees it is better to plant monoecious trees as pollenizers, and in that case all the trees will produce pods.

### Needs Warm Climate

The carob thrives only in a warm climate, and in the southern part of Spain and France it is planted mostly in proximity to the Mediterranean shores, possibly because of the freedom of such localities from frost. The tree is found to thrive in all parts of Southern California, around the shores of San Francisco Bay, and a few specimens as far north as Biggs in Butte County and Napa Valley. In these northern localities, however, the crop is very uncertain. The tree has a habit of blossoming late in the fall or early winter, and frost may occur which will destroy the flowers without injury to the foliage. Therefore as a commercial product the cultivation is likely to be confined to Southern California. The tree, however, is well worthy of cultivation on account of the beauty of its deep green coriaceous evergreen foliage, even in localities where it fails to produce its pods. The plant is usually propagated by seeds, though with bottom heat it can be grown from cuttings. Quicker germination is secured by soaking the seed in water for three or four days until they begin to swell. At Aleppo in Syria the propagators plant the seed in pots made of clay and cow dung, which after being dried, are filled with earth in which the seeds are planted. After the seedlings have reached a size for planting out the pot is sunk in the ground, and when it becomes moist in contact with the earth, the roots readily penetrate it.

### Bud to Hasten Bearing

While the carob is rather a slow growing tree, it lives to a great age and should be planted not less than 35 feet apart, and may be interplanted with peaches or other growths for income until the carob begins to bear. It makes a fine border tree, and at the same time yields a profit.

The trees are frequently budded with buds from the best variety taken from bearing trees, and may be expected to bear in three or four years. In California seedlings bear when six or eight years of age. While it is eminently a dry climate tree, the young trees will be found to appreciate irrigation two or three times during the season and respond to good treatment the same as our cultivated fruits.

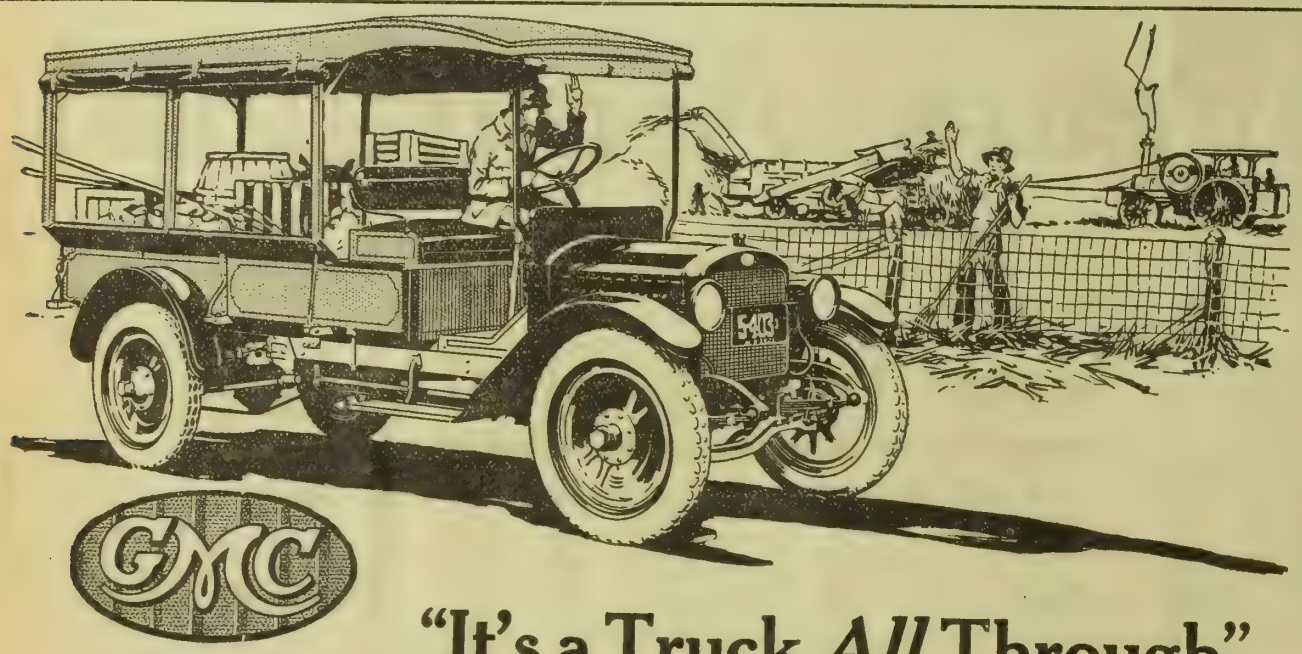
The pods ripen in the fall, September and October, and many of the trees, like some of our fruit trees, show a tendency to produce more abundantly in alternate years.

### Yields

Aaronsohn informed me that the crop in Palestine in good years on mature trees averages 450 pounds to the tree, and states that he has seen wild stocks 15 to 18 years after grafting yield 900 to 1000 pounds of pods. Du Brueil gives the yield in southern France at 220 pounds and mentions single trees in Valencia, Spain, that produce as high as 1380 kilos, or 3040 pounds. Among thrifty trees observed by the writer are a number in Alameda County, planted by the late Professor Hilgard, (between Centerville and Mission San Jose) about 30 years ago and more than 2½ feet in diameter. They produce crops annually. Others are grown by the California Nursery Co., at Niles, and are fruiting regularly. A few trees in Napa Valley and Biggs, mentioned above, occasionally produce crops of pods but are frequently injured by frost.

There are good sized trees growing in the park at Riverside, and one large tree at the Langenberger place at Anaheim. Mrs. Langenherber told the writer that she had sold pods from her trees to Italians at 40 cents per pound, showing that the variety is a valuable one and should be propagated.

It may be mentioned that during the Peninsula campaign the cavalry horses of Wellington's army were fed on carob pods instead of grain. The tramway horses of southern Italy are also fed on carob pods. The pods are frequently sold in drug stores and



GMC

"It's a Truck *All* Through"

Built entirely of truck parts, fast, staunch and enduring, the Model K-16 One Ton GMC truck is always ready to travel.

Every unit in it is of extra size and is designed for truck use only. That is why it lasts indefinitely under the hardest usage.

That is what makes it a "Jim Dandy" for the farm. It has the ruggedness, the power and the simplicity that makes it deliver more continuous haulage than other trucks over the roughest roads and under the severest hauling conditions.

This GMC has a number of exclusive improvements that both increase its operating efficiency and reduce the time and expense of maintenance. Such features as Removable Cylinder Walls, Pressure Lubrication, Removable Valve Lifter Assemblies and Instantaneous Governor Action help to produce a new and better kind of motor truck operation.

It has radius rods—recognized as essential to enduring truck construction—which take the driving thrust and absolutely keep the brake adjustment fixed whether the truck is loaded or empty. It has magneto ignition, recognized as the simplest, most reliable type.

It has both pump and thermo-syphon cooling. It has electric lights and starting equipment—separate from the ignition and wired in metal conduits. It has pressure chassis lubrication, demountable rims, cord tires and every other refinement essential to a high grade, dependable motor truck.

Write for an illustrated booklet "Motor Trucks On the Farm."

# Another Reason Why—

## California will supply the world with fruit food

**By J. E. Bergtholdt**

Secretary and Manager of The Silva-Bergtholdt Company, Nurserymen, and one of California's most extensive growers of fruit.

*The Second of a Series of Three Vital Messages to Fruit Growers*

IN MY FIRST ANNOUNCEMENT on "The Reason Why," in which I called your attention to the inevitable decrease of fruit production in the States outside of California as being an element insuring the growth and prosperity of the California fruit growing industry, I stated that there were other equally vital factors which, *if you are alive to your opportunity,* constitute a double assurance of your fruit growing business.

Have you realized that the dietary of the 120 million people of the United States and Canada is undergoing an evolutionary change? People are consuming with each year a larger proportion per capita of fruit and vegetable products.

This change in dietary is scarcely noticeable by the individual, but is an evolutionary fact, and when involving 120 millions of people, assumes each year an enormously increasing consumption of fruit products.

This process is not alone in evidence among the people of the North American continent, but is manifesting itself to a degree, in a like evolutionary change in the dietary of the people in other civilized lands, whereas the same adverse climatic conditions prevailing in every State east of the Pacific slope are, in a like degree, operative in every other country where fruit growing is practiced in agriculture.

### Facts Concerning European Production

For instance, the Prune, like the Apple, has been a staple food product of the European people, comprising a potential consuming population of over 400 millions.

Prune growing has been an important European industry for many generations, yet the entire production on the continent of Europe, according to the most authentic figures available, has never been in excess of 75,000 tons.

The production of France, Bosnia and Servia, the principal Prune growing sections of Europe, for 1921 was estimated at 50,000 tons, and advance information for this year's yield would indicate a little over 30,000 tons.

When you compare this production of a maximum 75,000 tons with an estimated production for California for this year of 110,000 tons, you will realize that in growing Prunes, Europe, though in the business for many generations, cannot keep pace with the California Prune grower. *This fact is further proved by the ever increasing exports of the California product to these European people.*

This is not alone true in quantity but also in quality of product.

What is true of the Prune is, in a larger measure, true of California grown Peach, Apricot and Pear, canned and dried.

### Potential Possibilities of European Consumption

When you consider that, barring import duties, the California product can be delivered to the European consumer at the same cost for transportation (and oftentimes for less) than to the American consumer, you must realize that, in addition to supplying our California grown fruit foods to the American consumer, there is tributary to the California product a potential consuming population of approximately 400 millions of Europeans. In supplying whose fruit wants, barring import duties, the California grower has the same advantage over the European fruit grower that he has over his brother producer in the various states East, in which, as shown in my former announcement, the production of fruit is gradually, but inevitably, declining.

When the industry in California has so organized its machinery of distribution that this potential European consumption will be intelligently exploited, the export business of California fruit may be made to reach enormous proportions, not to speak of the potential possibilities of exploiting the consumption of our staple fruit products in other countries, such as the Orient, South America, Australia, New Zealand and South Africa.

### Existing Facts Further Emphasized

You will now more fully realize what I meant in my former announcement when I showed that in view of the decreasing production, not alone of the states east of the Pacific Slope, but in Europe, and the gradual but ever increasing consumption of our staple fruit foods in the dietary of the world's population, that there is being created a vacuum that every acre in California planted to fruit cannot supply, provided, however, (*and this in the final analysis is the vital feature*) the California grower exercises *the forethought and good judgment to so organize the distribution of his products as to exploit the possibilities of this potential consumption to the maximum degree.*

To further illustrate, I will ask you to allow me to repeat a few facts that I have often, in connection with our nursery business, reiterated heretofore, for instance:

### Prunes

In the production of the Prune the California grower has an 85% monopoly (estimating the northwestern production at 15%), not alone in supplying the wants of the people of North America, but has also an enormous advantage over his Prune grower competitor of every other known country.

### Apricots

In canned and dried Apricots, the California grower has an entire monopoly of the consuming population of North America and a like enormous advantage over every other Apricot grower in other countries.

### Pears

Canned and dried, the same is true as of the Apricot.

In Pears to be eaten out of hand, the California grower, in quality of fruit, season of ripening, regular production and freedom from disease, has an enormous advantage in the American market over the Pear growers of the Northwestern and Eastern States, with as yet undeveloped potential possibilities for export to the countries of Northern Europe, to whom the Pear is a fruit as staple as the Apple and Peach to the American, and to whom, in the no distant future, our Pears will be delivered by refrigerator steamers at less cost of transportation per box than the present rail and refrigeration rates to the American consumer.

### Clingstone Peaches

In canned Clingstone Peaches, the California grower has a monopoly, both at home and abroad, for the reason that the California Clingstone Peach, owing to our climate—no rain during the ripening period—matures to a texture so firm that, canned, it is the only Peach grown that will not rag out in canning.

This is likewise true of the California Pear and Apricot, canned.

### Peaches-dried

By reason not alone of the substance and good quality of this dried product, but by reason of our dry summers, permitting of uninterrupted sun curing, there is no peach growing section anywhere where this product can be sun dried and delivered to the consumer in a degree of quality that will compare with the California product—true likewise of California dried Apricots, Pears and Prunes.

### Raisins

Raisins on this continent are grown only in California, and there are more raisins grown in California than in all the other countries of the globe. The California raisin grower has a practical monopoly of the North American consumption and is protected by tariff against European importations. In addition to that, on account of the quality of his product, he is enabled to compete successfully in the European market with the raisin producing districts of Southern Europe and Asia.

### Citrus

Inasmuch as the successful commercial production of Citrus fruits is limited mainly to the lower San Joaquin Valley and the Citrus growing districts south of the Tehachapi, this branch of the industry has more nearly reached its maximum production, with Florida, however, our only competitor, and to this degree the prosperity of the California Citrus growing industry is well assured.

If space would permit, in further proof, I could enumerate in detail like advantages which the California grower has in the production of Cherries, Almonds, Walnuts, Figs, Table Grapes, Olives, etc.

### Fruit Growing is California's Prime Industry

Summing up the facts presented in this and in my previous announcement, I am justified in the statement the truth of which is not realized by many, that *fruit growing* is, *more* than any other, the prime industry of California, and that in the future will add more to the development and prosperity of the State than any other activity, depending, however, upon one vital factor, concerning which I will write you in my next.

This comprises the second angle of my story. The third will appear in this publication at this time next month.

J. E. Bergtholdt

The Silva-Bergtholdt Company, Nurserymen,
New Castle, California

---

at fruit stands, and are looked upon by Italians as a sweetmeat. The sugary fecula surrounding the seed is very palatable and liked by most everybody.

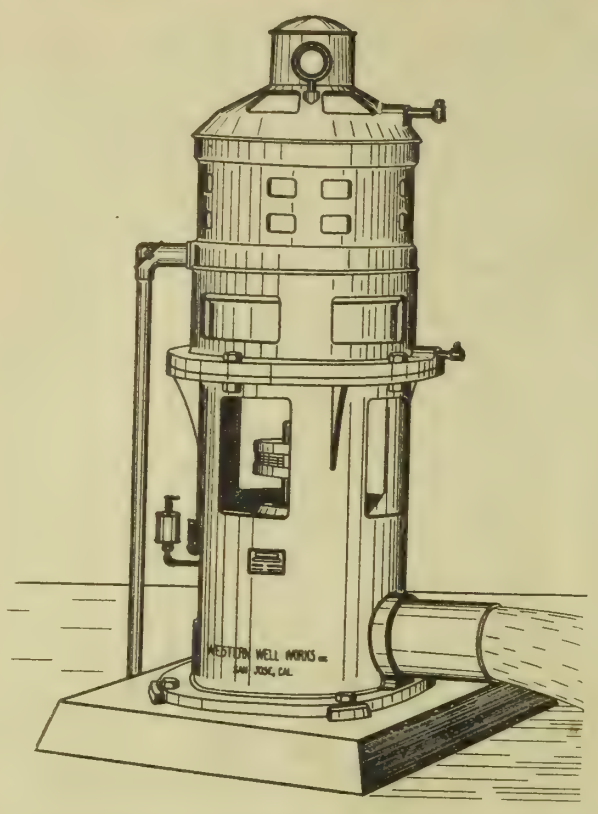
It is quite apparent that this tree is worthy of cultivation, both for ornamental and commercial purposes. It can be planted on rocky, rough land where it would be difficult to cultivate most other trees.

### IMPERIAL TO HAVE LOWER FREIGHT RATES

Declaring that rail freight rates between Los Angeles and Imperial County points had become excessive and discriminatory, the railroad commission has ordered put into effect within 30 days reductions applying to both commodity and class rates which are estimated to amount in saving to shippers to $200,000 a year on present volume of business. San Pedro and Wilmington are given the same mileage schedule of class rates as Los Angeles. This decision is designed to enable Imperial Valley to ship into the Los Angeles market upon equal competitive conditions with other agricultural regions, and receive supplies at fair rates. This case was brought by complaint of the board of supervisors of Imperial County.

Oregon cherry growers have been experimenting with placing fresh cherries in cold storage without sugar. The cherries were packed in five gallon cans. Northwestern berry growers have been successful for several seasons in storage of berries by this method.

# The Pride of Ownership



Install a pumping plant of which you can be justly proud.

### VINEGAR FROM CULL FRUITS

Request has come for reprinting directions for making vinegar at home from various fruits, written for the Cultivator last fall by W. V. Cruess. Here it is:

Good vinegar for home use can be made from grapes, apples, oranges and other sweet fruits. Culls, cores, parings and windfalls can be used as well as dried fruit, raisins and honey.

**Preparing the Juice**

A sweet liquid is first prepared containing from 10 to 20 per cent of sugar. This is made from the fresh fruit by crushing, heating and pressing out the juice. If the juice is not very sweet one-quarter to one-half pound of sugar should be added to each gallon The juice of very ripe grapes should be diluted with one or two pints of water per gallon. Honey should be diluted with an equal volume of fruit juice plus five times its volume of water. Dried fruit should be soaked in water (one gallon to two and one-half to three pounds of fruit) 24 hours, then heated and pressed.

**Peels and Cores**

To peels and cores, add three quarts of water to each quart. Boil a short time. Press and to each gallon of juice add one pound of sugar.

**Yeast**

The liquid prepared by any of the above methods is placed in a barrel, crock, wooden bucket or large bottle and caused to ferment by adding a cake of well broken up compressed yeast to about each five gallons of liquid. The vessels in which this fermentation takes place should be cleaned and sterilized with hot water and soda and must be free from vinegar. Never use galvanized metal.

The temperature of the fermenting liquid should not fall below 65 degrees Fahrenheit, nor rise above 90 degrees Fahrenheit. The usual house temperature in California is satisfactory. It should be stirred frequently during the first week and in two or three weeks all the sugar should have disappeared.

**Adding Starter**

It is then drawn or poured carefully off the sediment into a clean barrel, crock, or demijohn, inoculated with vinegar bacteria and acidified to prevent injurious bacteria from growing. Both these objects are accomplished by the addition of about one pint of home made or barrel vinegar from the grocery to each gallon of fermented liquid.

**Vinegar Fermentation**

A wide surface and exposure to the air are necessary for the work of vinegar bacteria. The barrel, therefore, should not be filled more than three-quarters and should be provided with air holes in the heads. Other vessels should not be too deep. All openings should be screened with fine netting or cheesecloth to exclude flies. A film of vinegar bacteria will form on the surface and should not be disturbed by stirring or by moving the vessel.

The higher the temperature up to about 80 degrees Fahrenheit and the more abundant the air supply, the more rapidly the vinegar is formed. Below 60 degrees Fahrenheit the process is very slow. In an ordinary kitchen the temperature is usually favorable. In from two to six months, according to the temperature, the vinegar can be used. It should be drawn off the sediment and put in full, closed barrels or bottles. If cloudy, it can be filtered through several thicknesses of cloth. If placed in full well corked bottles and heated to 150 degrees Fanrenheit for a few minutes it will keep perfectly for years and improves with age.

When the clear vinegar has been drawn from the vessel in which it was made the cloudy vinegar and sediment remaining may be used to start another lot. This is done simply by adding a pint of this liquid to each gallon of fermented juice. Never add vinegar or vinegar sediment to fresh unfermented juice; it kills yeast fermentation. Use yeast only on the fresh, sweet juice.

### RABBITS AND PET STOCK AT LOS ANGELES COUNTY FAIR

The Southern California Rabbit and Pet Stock Association is affiliating with the Ontario-Upland Rabbit Association in arranging a rabbit and cavy show at the Los Angeles County fair at Pomona, October 17-21. W. A. Hannah, president of the Ontario-Upland Association will have charge of the rabbit department and W. E. Dean of Pomona will manage the cavy exhibit. Lewis H. Salisbury of Pasadena, president of the N. B. and F. A. Inc., will judge the rabbits.

# Oil Light Beats Electric or Gas

## BURNS 94% AIR

A new oil lamp that gives an amazingly brilliant, soft, white light, even better than gas or electricity, has been tested by the U. S. government and 35 leading universities and found to be superior to 10 ordinary oil lamps. It burns without odor, smoke or noise—no pumping up, is simple, clean, safe. Burns 94% air and 6% common kerosene (coal oil).

The inventor, W. V. Johnson, 31 N. Fifth St., Portland, Ore., is offering to send a lamp on 10 days' FREE trial, or even to give one FREE to the first user in each locality who will help him introduce it. Write him today for full particulars. Also ask him to explain how you can get the agency, and without experience or money make $250 to $500 per month.

# DEEP WELL TURBINES

Built in all Sizes and Capacities Arranged for Belt drive or Direct connection Smallest size Will go in a Six inch well And has a Capacity as High as 150 Gallons per minute—next size will go in 8 inch well capacity up to 400 gallons. We also arrange these small turbines for automatic operation in connection with pressure tanks, etc.

# June Drop Again Takes Toll

By Robert W. Hodgson

THERE have been a number of factors responsible for the unusual June drop reported in all districts this season. The vitality of trees in many districts was seriously sapped by hot dry electric windstorms last fall. Humidities of eight per cent and less were reported in some districts. There was a heavy leaf drop and loss of vitality.

Perhaps the most important factor contributing to the general weakness of the trees was the January freeze. Not only were the temperatures very low, but the lack of moisture in the air was the greatest ever reported in connection with similar temperatures. The unusually slow recovery of the trees, by many observers is attributed to the extremely dry atmospheric conditions that obtained at the time of the freeze. Relative humidities of eight to ten per cent were common.

Following came a cool, delayed spring, with the soil not warming up until only recently. Then too, over the principal citrus districts late spring frosts occurred, in a few cases sufficient to injure the bloom; in most instances not sufficient to noticeably affect the bloom, but undoubtedly devitalizing to the trees in general and responsible for much of the shedding of the bloom in the early part of the season, as well as for failure on the part of many of the trees to put out a normal bloom. Then came a rather sudden change to normal summer weather. Summer temperatures have not been excessively high in most districts, but the sudden change has unquestionably caused a heavy dropping of what few fruits still remained. Taken all in all there could hardly have been a combination of circumstances more favorable to a heavy June drop than has occurred during the present season.

The investigation by the citrus experiment station during the 1916-17 season indicated that there are two principal overlapping causes of the June drop of the Washington Navel, most important being abnormal relation between the leaves and young fruits with respect to water supply. It was shown during the hot, dry summer days between 10 o'clock in the morning and 4 o'clock in the afternoon, the leaves were unable to secure as much water from the roots as they lose to the atmosphere by transpiration. The result is a decrease in water content. When conditions become severe the leaves are able to withdraw water from the young fruits situated adjacent to them, the fruits having been shown to have a higher moisture content than the leaves, thus serving as potential sources of water supply. It was shown by careful experiments that young fruits decrease markedly in water content during the hot part of the day, increasing again during the late afternoon and night to the normal point. This daily fluctuation in moisture content was established as the stimulus leading to abscission or shedding.

It was also shown that in certain seasons when climatic conditions are favorable, at least a portion of the drop is due to the young fruits being attacked by Alternaria fungus which infects them while still either in the flower stage or shortly after the styles are shed.

The control measures recommended in California Bulletin 290 are as follows. Careful selection of site, growing of summer cover crops, adequate irrigation, moderate winter pruning, closer planting, growing of adequate windbreaks, mulching.

### Fungus Theory

In the belief that a fungus is partially responsible, considerable spraying has been done, but there are no data indicating material improvement in set of the fruit through sprays, with one possible exception. In certain parts of the San Joaquin Valley, where citrus thrips constitute an important pest, claims have been made that the June drop has been lessened by spraying. It would seem quite probable that control of thrips might result in improved set of fruit.

During the last year or two this abnormal water relationship has been suspected by a number of investigators to be responsible for the shedding of immature parts and a number of investigations on this point are now under way. An abnormal water relationship of similar character is now generally regarded as the principal factor in the cracking and splitting of partially mature or mature fruits. It has been quite definitely shown with a number of crops, including peaches and apricots, that after the fruit has developed considerable sugar content the leaves are at a disadvantage during periods of stress and are sometimes actually dry up to the point where they are shed, the fruits having taken the water from the leaves.

### Influence of Cover Crops

During the past three years, investigations on the June drop of the Washington Navel conducted by the citrus experiment station in most points have definitely established that in certain seasons the percentage of Alternaria infection is quite high, and beneficial effects from covercrops have been noted, together with a distinct modification in the climatic conditions surrounding the trees. In an effort to secure a set of fruit through lowering the atmospheric temperature and humidity certain trees were covered with tents and grown under these coverings for several years. These were found not to carry as much fruit on the average as trees exposed. This is not peculiar, however, and is likely due to the cutting down of illumination and a reduction in the manufacture of elaborated foodstuffs.

Since the issuing of bulletin 290 a large number of citrus growers have raised summer cover crops in their orchards with varying degrees of success, in some cases utter failure. In a number of instances, however, in the San Joaquin Valley and notably in the vicinity of Bakersfield, phenomenal increases in yield have been secured. Several instances of the same character have occurred in Southern California districts. In this connection it is desirable to point out that so far as it is now known the importance of the summer cover crop in preventing June drop lies in the relation which it has to sudden climatic changes. It is not so much the average increase in atmospheric humidity and decrease in temperature which the cover crop causes which prevents June drop as it is the protection which the cover crop offers when sudden climatic changes occur. This protection is due principally to the average lower atmospheric temperature which has been found by a number of investigators to be from five to ten per cent lower than where cover crops are not grown and to the increase in atmospheric humidity which is quite pronounced. It is also probably due to the lower soil temperature which is more favorable to root absorption.

### Present Viewpoint on June Drop Prevention

Summarizing our present attitude toward possible methods of June drop prevention it may be said that

1. With very few exceptions and those probably due to the control of citrus thrips, spraying as a means of prevention of June drop has to date been found unsuccessful. Further investigations on this point are desirable. It should be pointed out, however, that Alternaria infection varies tremendously from year to year and spraying will therefore probably never give any remarkable results in prevention of June drop.

2. The summer cover as it is generally known, meaning a crop planted in the latter part of April or in May, cannot be expected to give appreciable results on account of the fact that no crop we now have planted this late in the season reaches sufficient development to provide measurable protection by the time it is needed. The spring covercrop planted in February, March or April according to local conditions is by far more promising. To date the most promising spring cover crops tried are buckwheat, melilotus alba, certain varieties of the soy bean and hubam clover. None of these is entirely satisfactory in all points and there is need for a search for better spring cover crop materials. It should be pointed out however, that cover crops should only be used where water is plentiful and cheap and where the soil has good underdrainage.

3. A greater use of windbreaks and closer planting of trees offers a promising means of June drop prevention. Many observations have been made of closely planted orchards yielding much heavier than trees of the same age planted wider apart, and there are plenty of observations to show that tree rows close to wind breaks consistently bear heavier crops than those farther away when all other conditions are similar.

4. It has long been recognized that the water requirements of plants growing in soils well supplied with plant foods are much lower than in soils where there are deficiencies in any of the principal plant food elements. This is particularly pronounced with respect to nitrogen. Hellriegel in 1883 showed that water requirements of plants growing in soils treated with varying amounts of potassium nitrate varied from 867 pounds of water per pound of dry matter where no potassium nitrate was supplied, to 292 pounds where 1.6 pounds

## Redwood Manufacturers Company

1604 Hobart Building, San Francisco

Los Angeles Office: 308 East Third Street

### THIS MONTH IN THE VEGETABLE GARDEN IN SOUTHERN CALIFORNIA

(Continued from Page 221)

early part of the month.

Sow seed of Crosby and Early Egyptian beets, Swiss chard, endive, kohlrabi, Los Angeles Market lettuce, Bermuda onions for green onions or for growing on to early mature onions, parsley, parsnips, Giant Amsterdam spinach, Chantenay carrots, turnips, radishes, peas and kale. Start seed bed of cabbage and cauliflower.

Ground that is not to be put to graden till next spring should be cleaned up as fast as crops mature, the trash put on a pile to make compost or turned under to decay in the ground to make humus. As soon as the rains come have the garden covered with manure to be turned under with the first spading or plowing.

## Southern Arizona

By M. E. Bemis

THE list of things plantable for September includes beans, beets, cabbage, carrots, cauliflower, kohlrabi, kale, lettuce, onion seed and onion sets, peas, radishes, spinach and turnips. Beans should not be planted except in the early part of September, and then not largely, as there is always danger of frost. Usually in the Salt River Valley we do not have killing frost until early in November, but sometimes it comes in late October. The late planted beans if they are not cut off by early frost will make a welcome addition to the home garden, but the commercial gardener hesitates about putting out a crop that may be cut off before maturity.

Beets, carrots and radishes may be planted at any time and in the usual way. Eclipse beets, Crosby's Egyptian, Early Blood turnip and Long Blood beet are varieties recommended. Swiss chard for the chickens and stock beets for both cows and chickens are worth while planting where space permits. Oxheart, Danver's Half Long, Chantenay and Improved Long Orange are recommended for carrot lovers, and more of us might to advantage cultivate the taste.

Seed of cauliflower may be planted during September. Henderson's Early Snowball and Large Pearl are recommended. A few growers in the vicinity of Phoenix are doing well with cauliflower, and it is probable that more will be grown as it is a popular vegetable on the Phoenix market. It is not especially difficut to grow, but the soil should be rich and porous.

Lettuce is easily grown, but still there are many failures, some of them due to poorly prepared soil, and some to soil that is not rich and some to worms and grasshoppers. Lettuce is usually grown on ridges 12 to 18 inches wide, 4 inches high 10 to 15 inches apart. Irrigation water should run between the ridges but not over them. There is a nice art in irrigating lettuce as well as cotton or most other crops. It requires plenty of moisture, but may be ruined by too much. New York Market and Arizona Wonderful are most popular in Arizona, especially for shipping.

Bermuda onions, Crystal White Wax, Australian and Yellow Globe Danvers are recommended for the home garden. For green onions plant in double rows 6 inches apart in ridges 12 inches apart. Green onions may be pulled and thus thinned. Some will mature for table onions later. Most people prefer for the home garden to set out the onion sets, as it is less bother.

Early peas may be planted up to September 15, and the later sorts any time. The dwarf varieties may be planted rather close together, that is 18 inches apart for the rows, but the heavier growing varieties should be planted in rows three feet apart. The Blue Bantam and American Wonder are good dwarf peas. Yorkshire Hero and Gradus are good peas of the later sorts.

Spinach should be sown in drills 12 to April. The Prickly Seeded Winter is the variety most commonly grown, but Bloomsdale is being grown some and is a favorite with many.

Cabbage may be planted for later transplanting, though most home gardeners will prefer to buy the plants later.

# September in the Ornamental Garden

## Southern California

By Ernest Braunton

FOR the next 60 days considerable attention should be paid to chrysanthemums (what a mouthful when 'mum's the word). This is the time of intensive feeding, but do not overdo it. More 'mums of promise are killed or spoiled by over feeding than by under feeding. Yet they should be heavily fed.

One of the first requisites is staking. If you have no large plant stakes or wire trellis use "stem stakes," that is, a small stake to each stem. These are best made of shakes—split shakes are preferable to sawed shakes. Tie with raffia or large soft twine; small hard cords will cut the stems. After staking feed well if buds have formed, and all but the late sorts should now be budded. Feed and water well until color shows in the buds then feed no more, but water still more heavily. The best local growers use liquid manure, made from that obtained from dairies. The best amendment to this is a solution of one pound sulphate of ammonia to 50 gallons water. Make your feedings semi-weekly and semi-weakly. To be short, feed little but often.

### Propagate from Cuttings

Nearly all herbaccous plants capable of rooting from cuttings will start easily during September. Get a box of any depth more than three inches, bore some holes in bottom so water may escape. If six inches or more deep either put in an inch or two of gravel or do not fill box to top. Four inches of sharp sand, not too fine, yet not gravel or having gravel stones of pea size in it, is just right for all cuttings. Put in cool shady place, but not in cold place and see how many kinds of plants you may root. Never let the sand get dry, yet do not flood it.

This is a good time for moving plants, especially tropical plants, the best time except the warm days of early spring. Nurserymen "dig and sack" palms etc., for winter trade during September in order to have them ready for winter trade. They recover from the shock in lath houses or shady places by covering the balls of earth with wet sand or wet shavings or sawdust. It is much safer to move plants and reset them in the garden, so be unafraid. When transplanted at this season water freely if weather is warm.

### September Sowings

Sow at once seeds of pansy, stock, calendula, snapdragon, flax, sweet sultan, salpiglossis, candytuft, lobelia, bachelor's button, Canterbury bell, foxglove, columbine, larkspur, hollyhock, pink, lupine, mignonette, penstemon, and sweet peas. Don't forget the sweetpeas now; they will give you Holiday flowers, the best of all the year. Dig soil up for at least a foot and make rich with well rotted manure. Soil cannot be too rich or too deep.

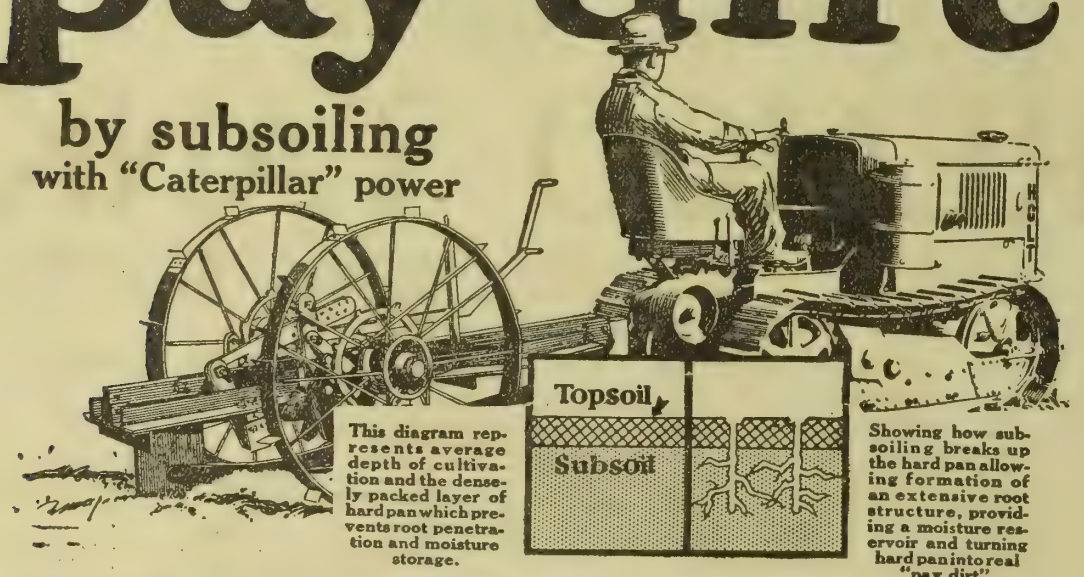
### Bulbs

Many sorts of bulbs may now be planted. Freesias and Watsonias are in full season and those that may be planted during this month are: paperwhite narcissus, Roman hyacinths, oxalis in great variety. Later in month also put in narcissus, ranunculus, anemone, sparaxis and ixia. When the new stock of lily bulbs arrive plant them as quickly as possible. They should be in market now and the less drying they receive the sooner will they "resume."

Cinerarias are very satisfactory if you have a good place, good soil, and will give them good care. Start seeds now, in light soil, in a box placed in a cool, shady spot. When plants are two inches high transplant to permanent quarters. This permanent position must be shady, except for sun up to nine or ten o'clock in the shortest days. The soil must be deep and rich,

# Turn hard pan into "pay dirt"

## by subsoiling with "Caterpillar" power



This diagram represents average depth of cultivation and the densely packed layer of hard pan which prevents root penetration and moisture storage.

Showing how subsoiling breaks up the hard pan allowing formation of an extensive root structure, providing a moisture reservoir and turning hard pan into real "pay dirt".

**SUBSOIL pan and hard pan cramp root structures, prevent proper drainage, check growth and yield. Subsoiling, with "Caterpillar" power, breaks up tough hardpan, conserves moisture, increases food area for roots and makes plants more resistant to disease.**

**Look at some of the results as told in hundreds of letters—"My prune crop graded 21 points better to the pound after subsoiling." "24 sacks of barley against 8 by subsoiling"—"Subsoiling saves fertilizer, saves 50% in water, saves 20% in plowing."**

**Subsoiling by "Caterpillar" power is the proved way—the economical way of producing better and bigger crops. The "Caterpillar" T-35 Tractor is the one *small* tractor with sufficient power for the heavy work of subsoiling. While it is only 48 inches wide and 52 inches high it surpasses, in power and endurance, many tractors of much greater size. Subsoiling is just one of the many jobs that the T-35 does easily. Its versatility is amazing—its dependability insured by Holt design and workmanship.**

**"Caterpillar" Tractors are made in larger size—the 5-ton, Western 10-ton and the big 75—to meet any power need. Subsoil before the rainy season. Send at once for complete information.**

***Here's what they think of the "Caterpillar" T-35 for subsoiling:***

**"I used the T-35 to subsoil and went down 20 inches deep the second time and you could hardly tell it was working.**
***Jacob Dittenbir*—Reedley.**

**"I have subsoiled 16 inches deep. Have also pulled a 7-foot double disc—the T-35 simply played with this load."**
***G. Weyand*—Acampo, Cal.**

CATERPILLAR

# The Holt Manufacturing Co.

*Stockton, Calif. Peoria, Ill.*
*Los Angeles, Calif. San Francisco, Calif.*
*Spokane, Wash.*

retentive of moisture and be kept moist. Cinerarias are very impatient of weeds, even small weeds, are gross feeders, always thirsty, and invite aphis or green fly. Fierce hosings will keep the aphis away and dusting leaves with tobacco dust after each hosing will complete the job. They thrive best under the same liquid manure treatment given chrysanthemums. Splendid results have been obtained by giving them very dilute doses of chamber lye every morning, but it should be made very weak if you are to make the plants strong.

## Northern California

By A. R. Gould

We are reminded of the fact that autumn is at hand by the glorious tints of the leaves and the color of the berried trees and shrubs. The Mountain ash and crataegus are now beautiful and as the season advances will add even more to the fall effects. No garden can be complete without these shrubs, and if you have none in your garden make a note of these for spring planting. The best are Crataegus leylandi, C. crenulata and C. augustifolia. For fall decoration they are unsurpassed.

Attention must be given the dahlias; they will need tying up, disbudding and spraying as the black fly or aphis is just now very troublesome. Detroy these with "Black Leaf 40" as it is very important to keep these in check. They may also be on the cosmos, etc. Keep the lawns well watered during the hot, dry weather and where necessary apply sulphate of ammonia or decomposed lime shell to color up the brown spots as a starved lawn is unsightly. Usually at this season snails and slugs will be doing their worst on the leaves and often blooms of your choicest plants. Hand picking is the safest way to get rid of these pests and their hiding place will not be far from their feeding place.

**Roses**

Now is a good time to apply a heavy mulch to the roses. If you did not prune the bush roses last month as advised you may do so now and still stand a chance of encouraging a few late blooms this season.

**Chrysanthemums**

These should be kept well watered and given liquid manure as advised last month. Where the choice large blooms on the single stem are being grown they should be put under cover this month. A muslin sheet should be arranged to cover the plants and protect them from the strong sun. Remove all but the crown bud or terminal if large blooms are desired. With the other types such as singles and pom-poms very little disbudding is necessary. Spray for aphis as they appear and have all plants securely staked.

**Begonias**

These need extra care as they will provide bloom for late in the fall and they like semi-shade and heavy feeding at this time of the year with liquid manure. Tall varieties must be staked.

**Bulbs**

It is not too early to plant freesias, and these may be planted in fairly rich soil in solid groups or the bulbs may be planted along the borders of the path. Plant the bulbs 3 inches apart and one inch deep. It will also be a good plan to place your order for the daffodils, narcissus, hyacinths and tulips.

**Lest You Forget**

For spring flowering sow at once on a well prepared border forget-me-not, pansy, viola, snag-dragon, alyssum saxatile, California poppy in all the new shades, nemophila, phacelia, clarkia, cineraria in tall flowering mixed and dwarf rose and blue shades, primula, dianthus and sweet william. The sweetpeas sown will provide a wonderful display just when you need it during the winter months, thanks to our sweetpea experts who through many years of selection and hybridizing have perfected a wide range of the best colors. Prepare the trench deeply with manure, having it well mixed and moist before sowing the seed which should be sown thinly.

## Southern Arizona

By M. E. Bemis

As everyone knows, the gay colored nasturtiums make a better display for three or four months of the season than almost any other plant. And considering the time, labor, and soil, they produce more flowers than any other annual and in such an array of colors that they are irresistible. Nasturtiums grow best on thin soil, too much moisture cutting the production of blossoms. They love the sun and are bothered very little by heat. But it is well to remember that soil which is too rich will not produce plants that can withstand the wet weather.

Pansies, too, are great favorites and seeds may be planted now in rich, moist beds with liberal shade, but, if the seed is good, any situation will do. Another good flower to plant at this time is the Sweet Alyssum. This flower may be used extensively for borders, edgings, baskets and cutting In order to have winter blossoms the seed should be planted in September or roots divided. Mignonette for winter flowering may be seeded now.

An Arizona garden would not seem

Those lights in the train

Long before the locomotive is coupled to the train, you push the button in your berth and the light flashes on. Have you ever wondered what supplies the current for those Pullman lights? Storage batteries, charged by a generator under the car when the train is in motion, furnish the current. Exide Batteries are used on many of the country's leading railroads.

In the automobile field the first starting and lighting battery was an Exide, and today more new cars have Exides than any other battery.

The pioneer battery for light and power plants on farms was an Exide, and a great majority of the thousands now in use are rugged, long-lasting Exides.

Experience in making batteries for all purposes since the start of the storage battery industry is built into the Exide for your car. The result is a battery that keeps its power through a long life of steady service. For real comfort and true economy in motoring, get an Exide when your present battery must be replaced.

Exide BATTERIES SERVICE STATION

The nearest Exide Service Station has a battery the right size for your car. If your present battery needs repairs, no matter what make it is, it will be repaired skillfully and reasonably. If not in your telephone book, please write us for the address.

The Electric Storage Battery Company
Philadelphia

Service Stations Everywhere

THE LONG-LIFE BATTERY FOR YOUR CAR

complete without the rich orange gold of the African daisy, seeds of which may now be planted. It is gaining popularity through its easy culture and long blossoming season. Hollyhocks will lend a touch of color and dignity. Seeds planted now will bloom next spring, as will Shirley poppies

It may be added, for the industrious gardener whose planting was delayed last month, that September still offers possibilities for planting the zinnia, Christmas flowering sweetpea, phlox aad cosmos.

# Herbicide Kills Weeds Cheaply, Effectively

**Satisfaction Guaranteed**

Destroys, **absolutely**, all pest weeds, noxious grasses, vines, shrubs, including Johnson, Bermuda, Morning Glory, Crab, Nut, Bronco, Water Grasses, Malva, Thistle, and all other noxious plants.

Herbicide is a triumph of modern science. It is a combination of chemicals, which, when sprayed on the foliage, permeates the entire sap system of the plant, and kills it root, branch, seeds and all. Inasmuch as the seeds, also, are killed, your next season's crop of weeds will be lighter and eventually you will banish them entirely.

Herbicide is **extremely economical** and easy to use. Does not require a professional sprayer. Far cheaper and more effective than hand labor with a hoe. To save freight we ship in concentrated form—one gallon makes ten gallons of spray. This is one of the reasons why Herbicide is a more economical spray to use.

Herbicide is tried, tested, proven. It cannot fail to remove noxious weeds in the cheapest and most effective manner known. **Now is the time to kill them.** Enrich your land by removing worthless weeds which sap the soil.

Write for prices today.

**Herbicide Chemical Laboratories, 1963-C Santee St., Los Angeles, Cal.**

### JUNE DROP AGAIN TAKES TOLL

(Continued from Page 227)

potassium nitrate was added to the soil. The pronounced effect of available nitrogen in increasing the set of the fruit has long been known not only with citrus but with other fruits as well. Lewis and Allen have found that the use of nitrate of soda in the apple orchards of the Northwest has resulted in phenomenal increases in set of fruit. This same relationship has been shown in the Arlington Heights fertilizer plots conducted by the citrus experiment station, and is well recognized by many progressive citrus growers who plan to each season apply quickly available nitrogen at the time of spring plowing. This relationship has been so well established as to be hardly open to dispute. It appears however that the underlying cause is likely to be found in the decreased water requirements of the trees in the presence of plenty of plant food and particularly of available nitrates. Therefore the maintenance of ample quantities of organic matter in the soil together with the application of quickly available forms of nitrogen fertilizers in early spring or cultural practices conducive to early warming up of the soil so as to encourage nitrification constitutes perhaps the most promising means for June drop prevention.

The recommendations of the writer for June drop prevention may therefore be summarized in the statement that for Southern California districts the maintenance of a high organic matter content in the soil, together with the application of a limited quantity of quickly available nitrogen in early spring is the most promising method for June drop prevention. For the interior valley districts, in addition to these practices, where ample water is available the growing of a spring cover crop offers a promising method of prevention and the use of windbreaks and of closer planting is to be advised as a possible means of relief.

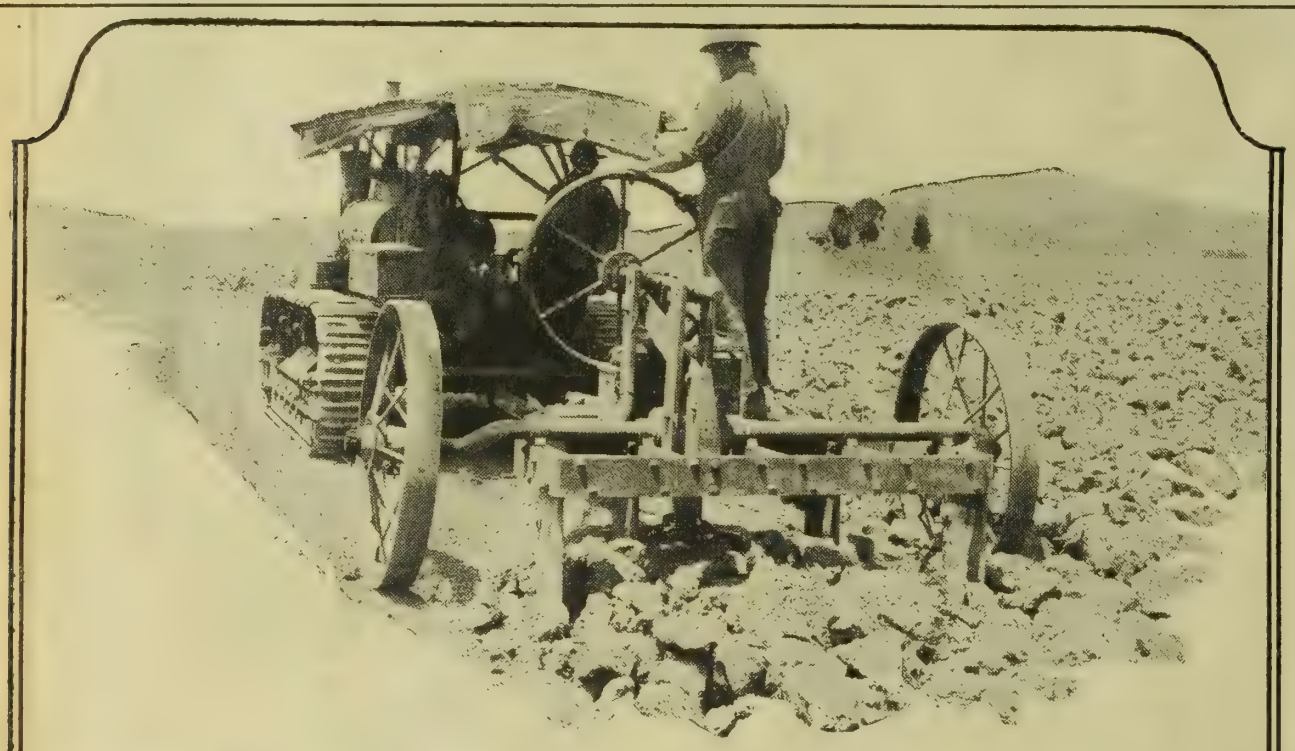
### NOVEL MUSEUM PLANNED FOR CATALINA ISLAND

Two hundred feet above the Pacific Ocean, and overlooking Avalon, Ralph Glidden of the staff of the Museum of the American Indian, George G. Heye Foundation, in New York will erect a unique museum that should prove one of the wonders of the modern world. Mr. Glidden is an archeological authority on the famous Channel Islands in whose ancient history there is steadily increasing interest.

Instead of a tower to crown it, the Glidden Museum will be capped by a gigantic skull, 16 feet wide, 11 feet high, and 24 feet through. For his model Mr. Glidden is taking the skull of an Indian chief which he unearthed recently on San Nicolas Island, just out beyond Catalina. The enlargement will follow its dimensions proportionately.

The museum will be an imposing structure of solid masonry, 30 by 40 feet. The skull featuring the exterior will serve as an index to the contents of the building. The eye sockets will be five feet in diameter, equipped with powerful electric lamps which will be visible far out at sea. The nose-bridge will also be fitted up with additional illumination, as well as the lower jaw. The effect of the latter will be designed so as to show up the teeth, whch were one of the notable features of the aborigines. The whole thing will be such that no one ever seeing it can forget Mr. Glidden's museum. If men ever grew large enough for heads of such a size as this skull they would be from 60 to 70 feet tall. Although the original Channel Islanders were large men, not many exceeded one-tenth of that size.

When completed the museum on Santa Catalina will be unlike anything else anywhere in this country. It will be open to the general public, and the builder plans to give talks on the relics so that the people who visit it will learn something besides having their curiosity catered to.



# Subsoiling Improves Crops

By shattering the hardened strata of earth, the hard-pans and plow-pans, the air and water get deep down into the soil. New soil resources are unlocked, bacterial action begins to work the soil into plant food; the little feeder roots reach out and draw the plant food in.

New orchard and vineyard land should be thoroughly subsoiled before planting. Successful growers are securing improved crops in old orchards and vineyards by subsoiling.

POWER is the key to modern soil culture. The Best "Sixty" handles the big 5-standard subsoiler and the combined equipment of large farming operations. The Best "Thirty" is adapted to the deep tillage demands of the smaller farm, orchard and vineyard.

### PRESIDENT HARDING SAYS

In speaking of the work of the American Farm Bureau Federation, President Harding says:

"Its policies have been directed with a uniform wisdom and breadth of understanding which have well earned the high place which the federation holds in the confidence of the country. I feel that it has been worthy of especial commendation by reason of the broad view it has taken of national problems and industrial relationships. This liberality of vision has been particularly illustrated in its broad and comprehensive interest in behalf of an adequate merchant marine, and its favorable attitude toward the Great Lakes-St. Lawrence waterway project.

"No particular department of industry or commerce will in the long run be promoted by an attitude, on the part of those immediately concerned for it, which excludes an accurate view of the common interest among them all. Being thus convinced, I have especial satisfaction in expressing my commendation of the federation's work and attitudes, and my sincere hope for its continuing and increasing prosperity."

# The State Fair of Interest to Women

WOMEN who have the opportunity of visiting the state fair will find much to interest them in the various exhibits in the big agricultural and horticultural building and also in the smaller buildings and the tents which cover the grounds. The fair management a number of years ago constructed a building to be devoted exclusively to women and their interests. This is the meeting place, the lounging room, the assembly room where friends may meet and old acquaintance be renewed. It is typical of a structure designed with the object of giving the most comfort to its women guests. This building contains splendid examples of needlework of all kinds from the simple quilt to the finest tatting and hand made lace. Splendid examples are shown of embroidery for household use, center pieces, doilies, napkins, linen and cotton finery of every description. Women cannot fail to be interested in the pleasing art exhibit, and the splendid pictures may be studied at leisure.

Adjoining the woman's building is the children's playground. There you may park the kiddies for an indefinite length of time and know that they are perfectly safe on the apparatus which has been prepared by the state fair management. This includes swings, wooden horses, merry-go-rounds and other things to amuse the children. All is set in a deep bed of sand where the little folks can play to their hearts' content.

You will find one of the most interesting buildings to be that of manufactures. This contains the manufactured articles which you will delight to have in your home, assembled under this one roof for your convenience and special observation. There are many aids to lightening kitchen drudgery, including improved cooking utensils, fireless cookers, patent stoves for oil, gas and coal, fancy baking dishes, washing machines, mangles and electrical appliances for every room in the house. Those who take an interest in cooking will find exhibits of special kinds of flour for particular needs, such as bread, cake, pastry and biscuits, together with many examples of flour suitable for hot cakes. Electric sewing machines occupy a prominent booth, together with a large number of improvements in the ordinary foot power machines. This building also contains the latest designs in furniture and bedding, carpets of various textures, window decorations, beautiful examples of home decoration, pianos and other musical instruments, the latest styles in house dresses and many other objects in which all women are interested.

After you have spent considerable time in the manufacturers building you can cross the main avenue and enter the educational building where your eye will be attracted by the exquisite lace work and you can watch the intricate process of rug making. Perhaps you will be most interested in the juvenile art work which is found on tables and walls. This has been gathered from the various educational institutions of California and is a splendid example of what young hands and young minds can do. Painting in water and oil is shown in beautiful landscape scenes and architectural designs, splendid applique work in pleasing figures, wood carving, furniture manufacture and a complete display of the work done by the manual training departments of grammar schools.

The main agricultural and horticultural building will have much of tremendous interest for women. There are splendid examples of canned fruit and vegetables, jelly making and preserving, and the making of cakes and cookies. Novelties of many kinds in fruit are displayed, and there are abundant samples to be had of delightful puddings, cereals and beverages.

A great many women find tremendous interest in the races which are held every afternoon from two till four. There is also plenty of music by three bands, together with vocalists and soloists on various instruments.

Those who do not desire to have their lunches in the restaurants will find ample accommodations on the beautiful lawns which surround the various buildings.

The general agricultural, poultry and livestock exhibits will be of great interest, as will also the big tractors and implements in the "Power on the Farm Tent."

At night there is a splendid display of fireworks in front of the main grand stand. This is a typical, old time display, including many beautiful set pieces, colored lights, bombs and figure fireworks of all descriptions.

Any woman who attends the state fair will be amply paid for the visit. Special consideration is shown women in every department, and the demonstrators take particular delight in having interested women in their audiences.

### A FELLOW FEELING

"Aren't you lonesome, my poor man?"

"Not so lonesome as I was."

"How is that?"

"I feel that I have company. You see, me and Germany can't pay our debts."—Ex.

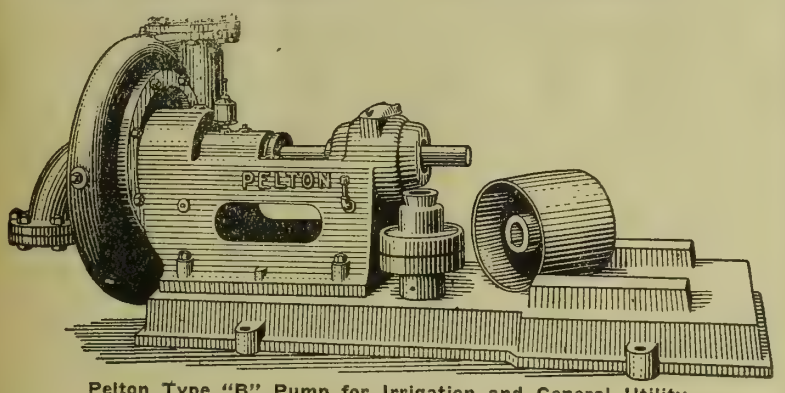
PELTON PUMPS

will be shown

At the State Fair

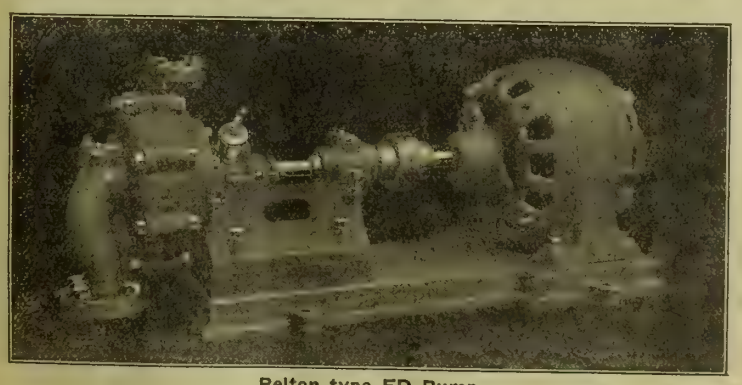
in the exhibit of

The California Mechanical & Electrical Engineering Co.



Pelton Type "B" Pump for Irrigation and General Utility, for Eeither Belt or Direct Drive

Not only Pelton irrigation and heavy-duty pumps will be exhibited, but there will also be shown in actual operation a complete pressure system, actuated by one of the new Pelton type FD pumps, an efficient and economical system for domestic supply and fire protection.



Pelton type FD Pump

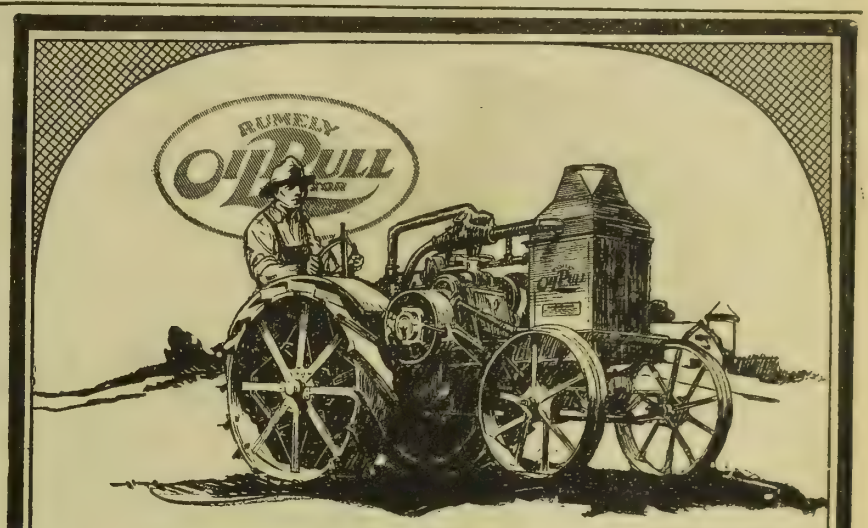
HYDRAULIC ENGINEERS

2033 Harrison Street San Francisco



Compare Power Costs

Purchase price plays the least important part of all in the cost of tractor service. How much fuel it uses to produce belt and drawbar power; how much repairs and upkeep cost per year; how many years of satisfactory service it is calculated to give, are the important factors to consider. Power is what you want and these factors determine the cost of tractor power.

OILPULL

*"The Cheapest Farm Power"*

Burns Kerosene, Distillate or Stove Tops

The OILPULL is a "quality" machine. It costs what good workmanship is worth. But think of what it does! Saves 39% of fuel cost. Has held all principal fuel economy records for the past ten years. Saves 50% in upkeep cost. Works day after day at this low cost for an average of ten years. Keeps depreciation at a minimum. These facts are proved by authoritative tests, investigations and comparisons.

OILPULL economy is due largely to TRIPLE HEAT CONTROL. This scientific system of oil burning positively solves the problem of getting the tremendous hidden power out of cheap kerosene, distillate or stove tops. It is exclusive with the OILPULL. Because of it we guarantee in writing that the OILPULL will burn kerosene successfully under any conditions and at all loads up to its full rated brake horse power.

For further facts and a demonstration see a nearby Advance-Rumely dealer. Or, write us for information and a copy of our booklet on Triple Heat Control.

# Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

### Pumping Problems

I have a three inch centrifugal pump. Wells are 18 feet deep. Can I pump into a 6 inch cement pipe 500 feet long, 40 feet elevation? What size electric motor and what size gas engine will it require? Will I have to put in a stand pipe or can I pump direct into pipe line? What will take care of the back kick when pump is stopped? What speed will the pump run?—Subscriber, Escondido.

A pump working under the conditions named cannot be satisfactory. Cement pipe, unless very heavily reinforced, will not be strong enough, and particularly so under the strain of stopping a column of water 40 feet high. Any stand pipe that might be put on will not relieve the strain sufficiently to prevent bursting a cement pipe. Unless the flow of water into the well is strong enough to keep the water from lowering more than ten feet you will have trouble from air getting into the bottom of the suction pipe even with the suction pipe reaching within two feet of the bottom of the well. The actual power used to pump 25 inches of water through a well finished cement pipe six inches in diameter to the required height will be seven horsepower. This will be large enough for a motor but a gas engine of one or two horsepower more than this will be more satisfactory. The pump will have to run about 1200 revolutions per minute though different makes of pumps will likely vary in speed required.—J. B. N.

### Budding Deciduous Stock

Have budded some deciduous fruit trees. Do the buds make any growth this year or do they remain dormant? Also does it make any difference whether the wood is removed from the buds, (just leaving the bark) or not before inserting them?—Subscriber, Terra Bella.

The budding is usually done early in the spring so as to secure immediate growth and growth during the entire summer. Some, however, prefer fall budding, sticking the bud in the fall and allowing to remain dormant over the winter and forcing early growth next spring. Usually the wood is not removed. Some think, however, there is slight advantage in doing this with some kinds of buds.

### Turkens

In regard to the new turkines, what do you cross to get them?—Subscriber, Manteca.

We presume the inquirer refers to a mongrel or offspring from the cross of turkey gobbler and chicken hen. It seems such cross is possible, and there are one or two breeders in the state who are breeding this stock and we believe offering for sale. We do not know what particular merit is claimed for the cross. We believe the name generally applied is turkens.

### California Tarweed

Kindly inform me as to use of California tarweed and market for same. —Subscriber, Willows.

There are at least a dozen distinct species of plants that are known as tarweeds in California. Almost any regional botany of this state contains five or six so-called in that particular territory. But none of them, so far as we know, have any market value. Indians roast seeds of Madia for food and also obtain a cooking oil from them, and seeds of Hemizonia are used likewise. Neither is of commercial value. There is, however, in your section of the state, a native "gum plant," very common, which is harvested in some counties by the ton and sold to manufacturing chemists. The extract is used in asthma medicines and in lotions for cure of poison oak or sumac. Its name is Grindelia robusta and it resembles a small light yellow sunflower, with a heavy "clubby" or almost globular head which is very sticky with a whitish gum just below the petals. Better send flowers of your plant for identification.

### Tomato Rot

To those who have asked for aid in combating blossom end rot of tomatoes, we can only say that nothing can be done. It has been thought that good drainage and control of water supply were factors in control of disease, but this has been questioned. The disease has been very bad this year and D. E. Milbrath, of the state department of agriculture is making a special study of it. If anything favorable is discovered it will be published.

### Leave Frost Injured Trees Alone

Regarding "Citrus Dying" which is touched upon in the query department of August 5, and many other times in the Cultivator, C. Lincoln Bennett of Santa Ana writes:

"I have recently examined numerous frozen trees. All those given good care but no 'treatment' are doing the best."

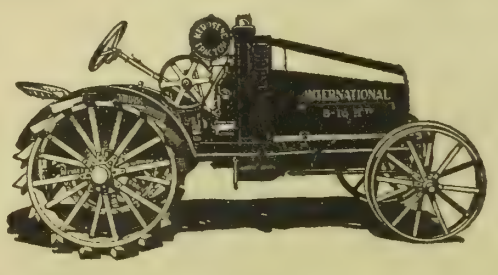
### Peach Scab

A number of peach growers of the San Fernando Valley are complaining because of peaches affected with a fungus causing small round spots or scars on the side of the fruit. This is proving so serious this year that some canners are culling and rejecting many. Some expressed the belief that it was a spot caused by dewdrops on the fuzz of the peach focusing the sun's rays and merely creating a physical blemish. However, specimens were sent to the Riverside experiment station and Dr. J. T. Barrett writes:

"The peach is infected with what is known as peach scab. It is caused by a fungus well known and with the scientific name 'Cladosporium carpophilum.' This is a disease which has not been, at least in recent years, of very great economic importance in Southern California. However, it seems to be on the increase in certain sections and because of the suitable weather conditions prevailing this spring for the development of the fungus and its spore germination it is quite prevalent on peaches. The same fungus also attacks apricots and produces a very similar effect to that noted on the peach. In severe attacks the skin of the fruit becomes hardened and sometimes badly cracked. Such fruit is, of course, unfit for use. The disease has become, the last few years, of sufficient importance to warrant a rather systematic experimental test for its prevention and control. I understand that Mr. Weldon this past year tried out a few spraying tests but with what result I am not yet informed."

### Rotate Crops

I wish to continue the good work of R. W. Bates. (See Cultivator, August 5, Page 130). Let us snuff out error and promote truth. The facts are these: No legume plant, of itself has any power or "ability to take nitro



International 8-16 - - - - - $670
Titan 10-20 - - - - - - - - $700
*With Free P & O Plow*
[Tractor and Plow f.o.b.Chicago]

## Greatest Farm Power Values—Bar None

REMEMBER that these are not stripped tractors, pared down to make low prices. Titan at $700 and International 8-16 at $670 include all essential equipment—belt pulley, fenders, platform, throttle governor, adjustable drawbar, angle lugs, brakes. This equipment for each is worth more than $100, and is necessary on any tractor to make it serviceable and safe. And above all, the prices include P & O Tractor Plows—2-bottom with the International 8-16 and 3-bottom with the Titan 10-20.

THIS is a time for investment in Titan 10-20 or International 8-16 tractor power. Make your choice and get the complete outfit from the McCormick-Deering dealer. Every day, keep this efficient power at work at your fall plowing and other drawbar work, and tie it up to all sorts of belt machines. By winter time you will be enthusiastic about the all-around usefulness and economy of International Harvester tractors.

These tractors have enormous reserve power, as every owner knows. They pull their plows in all soils with the greatest ease, and they have extra belt power in proportion. They are famous for long life. As the seasons go on you will find them outlasting smaller, inferior tractors, actually by several years. You will find also that they do their best work on kerosene and that the expense of repair and upkeep is remarkably low.

These are the greatest of all power farming values—bar none. Nearly a hundred thousand owners are proving it. Be guided by their judgment. See the McCormick-Deering dealer.

# EASY NOW TO RID YOUR PLACE OF FLIES

**Widely Known Scientist Discovers Wonderful Chemical That is Fatal to Flies. Not a Poison—Harmless to Stock.**

Flies are one of the most dangerous and annoying things with which the farmer has to contend. Now, through the discovery of E. R. Alexander, widely know scientist, you can rid your house and barns and livestock of these pests almost instantly, and with no trouble at all. This discovery is in the form of an organic chemical that is fatal to flies, and similar pests, such as chiggers, mosquitoes and moths.

This new discovery, which is called Alexander's Rid-O-Fly, is not a poison. Though it kills flies like magic, farm animals and human beings are not affected by it at all. In addition to killing these insects, Rid-O-Fly is a strong repellant. Flies will not come near stock or buildings where Rid-O-Fly has been used. Rid-O-Fly is particularly valuable for cows and horses, as it is a known fact that flies do untold harm to these animals.

So confident is Dr. Alexander that his discovery will rid your house, barns and live stock of these pests that he offers to send a $2.00 supply for only $1.00 on the guarantee that if Rid-O-Fly does not solve your fly problems it will cost you nothing. Two big Kansas City banks guarantee the reliability of this offer.

SEND NO MONEY—just your name and address to the Alexander Laboratories, 1577 Gateway Station, Kansas City, Mo., and this introductory offer will be mailed at once.

THE SUREST AND PUREST FOR DUSTING AND BLEACHING

ANCHOR BRAND SUBLIMED VELVET FLOWERS OF SULPHUR, also EAGLE BRAND and FLEUR DE SOUFRE, packed in double sacks, are the FLUFFIEST and PUREST sulphurs money can buy. The fine light SNOWFLAKE-LIKE particles float to every surface and crevice of the plant.

Do not adulterate these sulphurs with any inert material such as Lime or Kaolin, etc. Coating the sulphur particles with an inert material PREVENTS the FUMING ACTION caused by the sun's rays.

gen from the air and store it in the soil" as Mr. Frazer and lots of others claim. On the contrary, all legumes are ravenous users of nitrogen and soon rob the soil of that element as the crops are grown and removed. Nature, aided by scientists, has provided a way for its replacement, but our "high brow" friends don't seem to know it. There is no "continuous bean field" in the world, under our ordinary practice, that shows as good yield this year as it did years ago. Witness—The worn out "persistent" bean fields of Illinois and other Mississippi Valley states. In this state. take the Greenville district a few miles southwest of Santa Ana; 40 and 50 bags to the acre, of Limas, a few years ago—now 20 to 25 is a big yield. Note the "40 miles of beans" between Santa Ana and Oceanside. The crops of late years are nothing to what they used to be—nitrogen approaches exhaustion; ground lean of humus. The farm advisor of Ventura County recently wrote: "A survey of the average bean field shows that many plants have but few pods and small numbers of beans per pod." "Expenses as great for a poor crop as a good one. Growers discouraged." Does that sound like the famous Ventura bean fields were "improving each year?" Mr. Bates' experience shows the striking truth. Why can't our "men in high places" get onto these truths and give it to us straight?" That's my question. Will any one answer? The remedy is simple and inexpensive.—"Imp" Rover.

We know of no general propaganda urging continuous cropping, even to beans. In fact, we believe our educational institutions have spent much time and money in publications urging crop rotation. Further, we believe it has been pretty thoroughly established that beans make one of the finest crops to be used in the rotation scheme, this because of their ability to get along with a lesser quantity of nitrogen than many other crops. Express it as "ability to gather nitrogen from the air," or as you will, leguminous crops have proven their own abilities as valuable aids in soil upbuilding. But soil upbuilding is not accomplished through everlasting removal of crops from the field without making some return. Unfortunately it comes hard fc some of us to determine exactly what the soil does need. We have determined as fairly correct proposition that soil building means "building" and not the application of any cure all. But the snuffing out of error and the promotion of truth is, unfortunatey, for most of us, a matter of growth which makes it impossible to state with absolute definiteness all the "facts" in the case.

### Irrigating Vegetables

Please inform me how often the following vegetables should be watered, all of which were planted a week ago: string beans, peas, tomatoes and squash. Soil is of medium texture, holding moisture well.—Subscriber, El Centro.

Frequency of irrigation is purely a local problem, depending on nature of crop, soil and weather conditions. All young plants in your district need frequent water; if planted but a week they should not go more than three days without new supply. When growing well tomatoes and squash will need but one-fourth the water necessary to keep peas and beans growing.

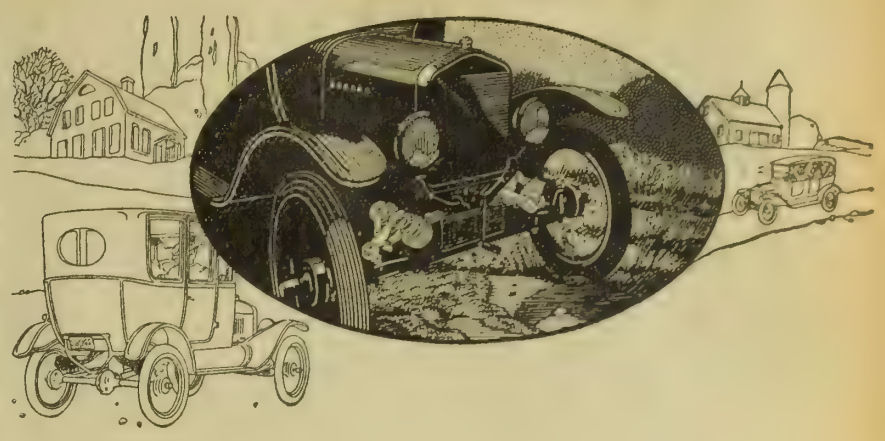
### Dates Dropping

Could you explain cause of souring and dropping of a limited quantity of green seedling dates? The dates that dropped showed no signs of insect infestation.—Subscriber, El Centro.

Excission of green dates is due to either soil or atmospheric conditions. Unfavorable weather is one factor and a heavy irrigation with cold water, especially in a cool period, would be another. But the contributing causes possible are so many that definite answer is impossible.

### Vine for House

Kindly advise me what is the best vine to plant on the west side of a



# Good roads are coming—*but* you can have Hasslers *now!*

SOME day, the statesmen say, all our roads will be perfect! But why wait? You can have Hasslers *now* and escape most of the troubles bad roads cause.

Even the so-called "good" roads of today are seldom perfect throughout. There are invariably old worn stretches that make Hasslers a vital necessity for comfort and economy.

Hasslers smooth out the bumps, reduce vibration, minimize breakage, save repairs, and slacken deterioration of your Ford or Dodge Brothers car.

That is because they have a double action. They cushion the bump; then check the rebound. Unique Hassler features, that you can get only in Hasslers, make that action possible. No single acting device, whether shock absorber or rebound check, can ever give you Hassler results.

Test Hasslers ten days at our risk. If you are not satisfied, money back.

suction pipe

# A Pump without lubrication troubles

No lubrication troubles because there are no under-surface bearings to lubricate. The only lubrication required in the New Bean Turbine is in the head, where a radial thrust bearing operates in an oil bath. We have eliminated all drive shaft bearings through improved construction. The advantages of this construction are at once apparent.

*Built in All Sizes from 6-inch up*

The Bean Turbine goes into a bored well—or into your old pit, if you have one. It is suspended entirely from the surface—and can be easily removed when desired.

*Efficient—Economical*

This pump develops surprising efficiency and delivers the maximum of water at the minimum of cost. Requires little attention and the heavy substantial construction insures long and satisfactory service.

Send the coupon for Turbine Pump Bulletin—also ask for catalog of Horizontal Pumps, if interested.

house in San Joaquin Valley for early shade and when should it be planted? —Subscriber, Earlimart.

"For early shade" is a little vague; perhaps rapid growth was in mind. As permanent results are no doubt desired there is no better vine than the common Chinese or Japanese honeysuckle. It is hardy, vigorous, as free from disease or pests as any plant, of good appearance, flowers freely, very fragrant, grows quickly and has no objectionable qualities not chargeable to vines in general. It may be planted any month in the year. It may be that it was desired to plant seeds but query does not so state. If such information is wanted "come again."

### Trees on Line

Neighbor has row of eucalyptus trees planted about three feet from our line on his land. These trees are about 100 feet high and a lot of the limbs extend over our land so as to shade two rows of our orange trees. These take moisture from the orange trees. Could we make this neighbor take out these trees or trim them in such shape that the trees would do us no harm?—Subscriber, Garden Grove.

This is one of the most perplexing and most often repeated questions which come to the Cultivator office. Recent decisions have been in effect that the person maintaining the trees which damage another is responsible for all damage which can be proved and must pay for such loss or injury. In addition decisions have been rendered in effect that where they are a menace or continuous injury to neighboring property they may be abated as a nuisance. In the former case one must secure an attorney and enter suit for the injury suffered. In the latter case, reporting to county district attorney may possibly be sufficient.

### MANY MORE EGGS IN STORAGE

A check of Northwestern markets develops the following estimates as to holdings of eggs in storage plants: Seattle, 50,000 cases against 40,000 a year ago; Portland, 60,000 cases against 51,000 a year ago; Tacoma, 30,000 cases; Bellingham, 18,000 cases; Spokane, 18,000 to 22,000 cases; Boise, 9,000 cases; Walla Walla, 6,500 cases; Yakima, 4,000 cases; Butte, 7,000 cases; Salt Lake City, 18,000 cases. In every one of the larger markets these figures represent total in excess of those for the previous year, and with at least normal production assured for this season, there is no great optimism in the storage egg deal.

## Snappy Notes on Livestock

Any error herein is unintentional and subject to correction the following week. This summary is assembled from the best sources obtainable, and both producers and packers can assist by reporting actual sales or buys, giving names, dates and facts, and we will, if requested, withhold names. All we want is fact and a fair deal and correct information for the producers. Address A. L. Spellmeyer, care California Cultivator, 317 Central Avenue, Los Angeles. The Cultivator reaches over 40,000 producing farmers and livestock men.

Steer beef is strong 7.50 Los Angeles with 8 cents asked for some lots. General flat offers f. o. b. country for beef steers of ordinary quality are 6 cents with 6.50 for heavy fat steers and cows from 4.00 to 4.50. At the same time I have found several lots of good steers that sold at a 5.50 delivered Los Angeles price and other lots of heavy steers that sold at 7.45.

Carcass meat prices are competitive. One packer who was asked for the prices for this column on his average steer and cow carcass sales stated the prices were changed daily and he could not give them over the telephone. It was rather startling to run into a revival of the old time played out secret price and selling packer method. The list put out by another packer gives 13.50 as price for No. 1 steers and 27 for lambs and 18 for hog carcass. The facts of bills among the retailers give cow carcass sales from 10 to 11.50, beef carcass from 11 to 12 and lambs at 24, with hogs from 18 to 20 and hog loins up to 32 cents.

It is evident a merry little price cutting campaign is on for volume trade among the various abattoirs. It appears the good cows that are costing 5 cents or better are being sold on the 11.50 basis and the good steers that cost 7.50 on a 12.50 basis. This is a reasonable margin but would be healthier if carcass prices were two cents higher. The killer has had to pay more for lambs but is making a good profit on them. From carcass indications lambs and hogs look stronger than beef for the next 60 days.

Lambs have been peculiar. The bankers backing Colorado feeders sternly declared they would advance no money for buys over 10 per cwt. on feeder lambs but after casting up the possible supply must have changed their mind. Further details arriving from New Mexico and Arizona contracts show that 11 to 11.50 was the New Mexico feeder lamb price per cwt. and 10 for heavy Arizona feeder lambs, without cuts and 10.50 for the better end. Eastern prices from the best of the K. C. commission men show a 12 to 13 cent lamb market, but this will have to better to attract any shipments with feeders going the strong 10 to 11.50 basis in the range districts. A strong demand for dairy cows at $75 to $100 f. o. b. country exists now.

Colorado sent to Los Angeles city 25 per cent of the steers fed in that state last winter, and a significant item is that Colorado buyers were down in Northern Arizona offering 5 cents f. o. b. for some lots of fall delivery steers. Five cents seems fairly settled as the fall feeder steer price irrespective of where the cattle are, in California or Arizona.

A bunch of 1500 old ewes has been contracted f. o. b. northern Arizona for fall delivery at $6 per head. The same outfit sold its May lambs at 10.50 and its other lambs at 10.00, all f. o. b. for fall delivery, and totaling over 6000 head. California sheep men can well take notice I am not giving a few top notch sales but general contracts covering over a hundred thousand head contracted. Also several Colorado and eastern buyers are writing in for they have heard that fat lambs have been selling in California as low as 9 cents f. o. b. range. Down in New Mexico, which has some light sheep and some good ones also, there is a drouth, and even in that drouth good ewes are bringing on the ten dollar basis practically forced by range condition on the market. A sheep is a sheep now, with a lamb that dresses 35 pounds of meat bringing $7.50, and a yearling steer that will dress 350 pounds of meat only four times as much.

If Texas doesn't get good rains soon, and if the boll weevil gets the cotton, the word is there are going to be some bad times.

It is not made generally public by beef buyers that both New Mexico and Texas have been dry, very dry in fact, and the financial condition is bad because this condition comes on top of several years of low livestock prices that followed a previous drouth.

And all this means no grass beef from those districts for us, and, what is more important to us here, no grass beef for other districts that will be meeting us for fat cattle in territories usually considered sacred to this California and Portland market. If we get more than a smell at certain Idaho and Wyoming fat steers this year it will only be through a much higher market here than reports indicate.

Carcass prices are competitive. Secrecy instead of publicity rules actual carcass beef prices and live beef prices in some of the packing houses. A merry little price cutting campaign is evident.—A. L. Spellmeyer.

### COW TESTING WINNING

The Stanislaus County farm bureau reports through its Supervisor Gorow, successful mid-summer work accomplished by that association. Mr. Gorow writes:

On the first of August two additional units of the testing association were started on the West Side of the river, making approximately 3700 cows signed up in the testing association, which makes it one of the largest, if not the largest, in the world. H. L. Mead will be in charge of the Patterson unit, while H. B. Tucker will be in charge of the Crows Landing unit.

Later in the fall, after sufficient information has been obtained, it is hoped to put on a purebred bull campaign, especially on the West Side, where a large number of scrub bulls are being used at the present time.

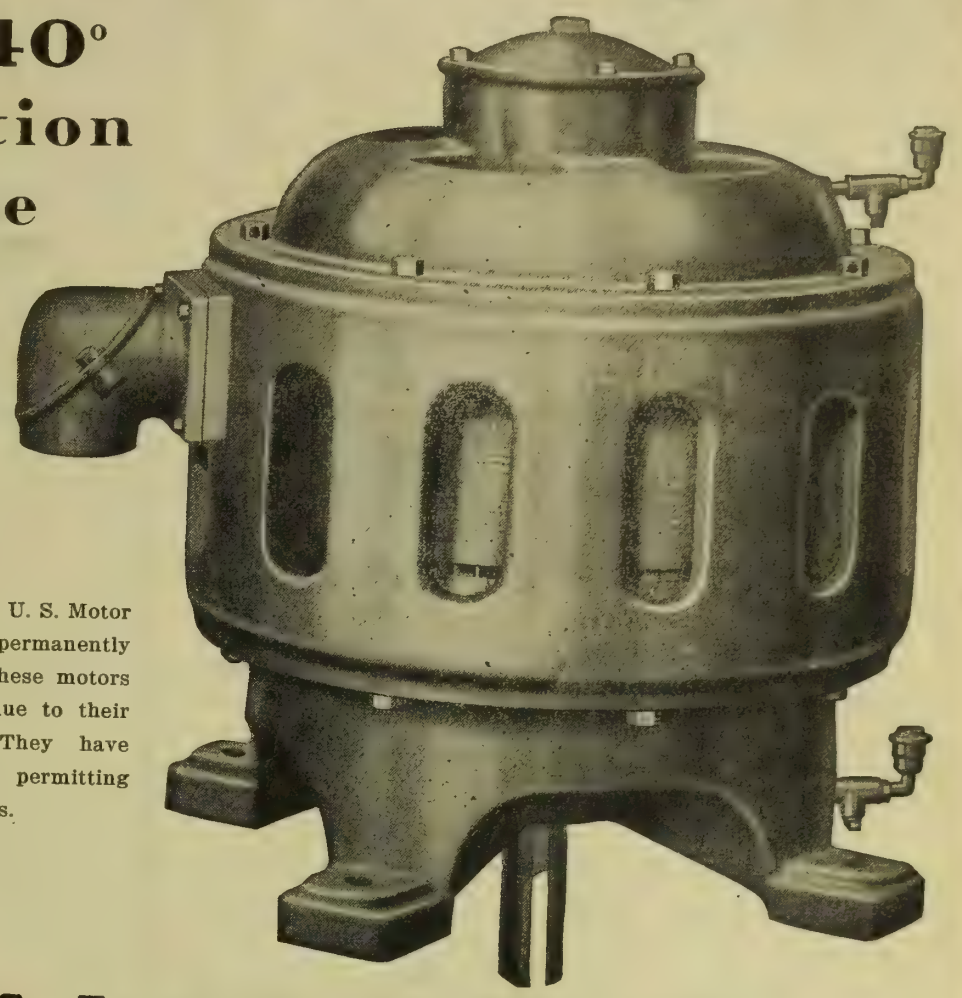
A few of the dairymen have started feeding grain ensilage, which was put in the silos about a month ago. Some of them are obtaining very good results from it, while others, who did not put it up in the right manner, have found it difficult to have their cows eat it as they should. The cause of this trouble has been that there was not enough sap in the stems of the plants when they were put into the silo; and consequently, the ensilage is too dry. The man who added water to it when it was being put into the silos, in most cases found that the cows will eat it very well.

H. Stammerjohan has a registered Holstein cow, Prilly Maid Wayne Colantha, which in her 24th month of continuous milking since her freshening, has produced 39 pounds fat. This is a very good record of production over such a long period of time, her 24th month being the first month that she has not been on the honor roll.

U. S. MOTORS

The 40° Irrigation Type

Built in the West to meet Western needs . . .



If a pump is driven by a U. S. Motor then power efficiency is permanently assured. The fact that these motors cost less to operate is due to their scientific construction. They have greatest ventilation area, permitting cool operation at all times.

U. S. ELECTRICAL MFG. CO.

Largest motor builders in the west since 1906

Our Electrical Engineers are ready to serve you.

H. P. TRACKS for Fordsons—

They complete the Fordson, give it greatly increased power and multiply its ability many times. A Fordson with H. P. Tracks will negotiate hilly ground, impossible with its regular wheel equipment. It will also pull in sandy soil or in deep soft spots.

H. P. Tracks are simple in operation and so sturdy in construction that they will outlast the Fordson itself. They readily replace its regular wheel equipment.

H. P. 40 for Heavier Tractor Service

A step ahead in tractor construction is the H. P. "40"—the design of C. A. Henneuse, an eminent tractor engineer. After many months of experimenting and refinement, we are now ready to market them on a quantity basis. The H. P. "40" is the most powerful tractor of its size ever built. See it at the State Fair.

### THE QUEST

The Little Road to Happiness,
Men seek, it far and wide
For whosoe'er shall journey there
He shall be satisfied.

It leads by cool and quiet ways,
Such as we walk in dreams,
With cloudless skies, whose starry eyes
Are mirrored in still dreams.

Some lose it in the market place
Who barter youth for gain,
And gilded vice with loaded dice
Shall throw for it in vain.

O Little Road to Happiness—
You seemed so far away,
I never knew that it was you
I journeyed by each day.

My restless heart went far afield
On many a weary quest;
But now I know the path you show
To Love and Home and Rest.—Ida C. Morris.

## HOUSEHOLD QUERIES

### Green Through Silver Gray

I want to paint two rooms a grass green and have it show dimly through a silver gray top finish. Can you tell me how this trick is done?—Subscriber, Rohnerville.

This question was referred to the service department of a reliable paint manufacturer which answers:

"To obtain a silver gray with a green background we recommend first experimenting with a smooth piece of wood before attempting to finish any of the rooms in order to obtain the exact shade desired. First paint the surface with any good prepared paint and with the shade desired. Allow the paint to dry for twenty-four hours. It is necessary for the final coat to use a material called glazing or blending liquid since this material is transparent and any shade desired can be mixed with it. We would recommend using a gray mixed paint and adding a small percentage of glazing and blending liquid to this gray paint. Paint this gray finish directly over the green and while still wet make a small pad from cheesecloth, or a sponge will do very well, and stipple the whole painted surface. This stippling effect will allow the green to show through the gray and we believe is the finish desired."

### Making Old House Comfortable

For some years I've enjoyed the Cultivator and received much help from it. Now I'm asking for more help. We have moved into an old house and do not want to spend very much money fixing it up, so I'd like to know how other women have made over old floors, etc. These floors are so worn and uneven that I don't want to put down linoleum. I've read some place about using roofing paper on a floor. Would like t hear from some one who has used it, and how, and was it satisfactory, and what did it cost? The walls are lined with rough lumber. What would be the cheapest way to treat them? We want to do all the work ourselves. I'd like to know all that anyone else can say about making over an old run-down house in the country without any hired help and at little expense.—Subscriber, Woodland.

One of the Cultivator staff made over a very rough floor of an attic which was remodeled into living quarters, by patching and padding with leftovers of wall board used to cover the rough walls. This was covered with linoleum and is wearing well though it has been rented to changing tenants for a couple of years. To finish the rough lumber walls the service department of W. P. Fuller & Company suggests:

"The most economical finish that we know of that will produce a satisfactory, artistic finish is the application of an oil stain. These oil stains come in various shades such as browns, greens or grays and are a very satisfactory finish."

### Floor Finish for Hard Wear

Please advise me the best way to finish the floor as we are using rugs—to paint it or to stain? Which would last the longest or make the hardest surface and what kind of paint or stain should we use?—Subscriber, Palermo.

W. P. Fuller & Company answers: "There are several ways to finish a floor and all are satisfactory. A floor that is stained with an oil stain to a light oak, dark oak or walnut shade can be waxed with a good grade of floor wax, and periodical refinishing with wax makes the simplest finish that can be applied to a floor. The floors, if treated every two or three weeks, will remain in good condition and are very satisfactory. To preserve the grain of the wood and still have a high gloss finish to the floor there are many colored floor varnishes on the market which stain the floor and finish it in one operation. Two coats of one of these colored floor varnishes make a very satisfactory finish which can be washed and which resists heel marks and abrasion very well. The best finish that can be obtained on a floor in order to preserve the natural grain of the wood is by the application of, first, a coat of oil stain and, second, if an open grained wood such as oak is used, a coat of paste wood to match the wood. Third, a coat of high grade floor finish, which should be followed by either one or two coats of the same varnish. This is the best finish that can be obtained on a floor and lasts the longest of all finishes. Fourth, of course, all floor paint hides the grain of the wood and may be objectionable on this account. There are many grades of paint, which are especially made for floor use, and one of these should be used. Floor paints are made from glossy varnish combined with a hard drying pigment, which produces a finish that stands hard wearing. Floor paints are made in many shades and it is a matter of taste entirely as to color that should be used."

### Who Has a Tile Drain Board?

May I, through this department, ask this question of some one who has had experience with a tile drainboard? Will some subscriber who has had two or four years experience with a tile drainboard around kitchen sink please tell me if it wears well under ordinary wear or does it in time as the cement between tile wears out, get grease and dirt into the cracks and look dark and untidy?—Subscriber, El Monte.

### Floor Oil

I have been unable to find out the exact formula for one of the best floor oils I have ever seen. Applied hot with a brush on a new pine floor, it remained for eight years without being renewed on a kitchen and bedroom floor, in good condition, occasionally wiping floor with a little warm water and kerosene. The ingredients are boiled linseed oil, turpentine, beeswax and rosin. Can you find out right proportions for me?—Subscriber, Santa Cruz.

An expert answers for us: "The formula you mentioned for floor oils does not seem to be practical to us as it is very unusual to add a rosin to wax, turpentine and boiled linseed oil. Such a floor oil would be sticky and altogether unsatisfactory, we believe. The best finish that we know of, if something in the nature of an oil is used, is to purchase a high grade varnish and thin it about half and half with turpentine and apply this combination. If this process is used a good hard drying and penetrating floor oil will result, which will not catch dirt and dust and will add years in life to any floor to which it is applied."

### Uses for Sweet Lavender

Having seen so many questions answered in your paper I hope you will be able to answer mine. I have several plants of lavender and will consider it a favor if you will tell me how small articles are made of the flowers and stems; also the time when they should be cut and how to preserve the flowers as they are sold for sachets, etc? We consider your paper the best all around paper that we have taken. Thanking you for the help I am sure you will give me.—Subscriber, San Luis Obispo.

Just as the flowers come into bloom is the best time to cut stems for use. If flowers only are to be used,

"Standard"
PLUMBING FIXTURES

"Standard" kitchen sinks, "yard stick high," provide comfort and prevent back strain. How high is yours?

cut when bloom is open. If stems are to be woven into sachets, holders, etc., cut and weave while fresh, then dry in shady place. For curing blossoms, cut off blossom heads, spread on papers or cloths to dry in shady place as you would rose leaves. Very little curing is required. When dry rub blossoms loose from stalks or for many uses blossom heads may be used as they are. One of the most delightful uses I know for lavender blossoms is to fill small pillow—size of a baby's pillow—with the blossom heads, cover with gay cretonne or silk—I prefer natural linen—and place among pillows on the couch. The fragrance is exceedingly grateful to the tired one who drops down for a moment's rest. Fragrance is barely noticeable unless you beat the pillow, then the sweet, clean perfume fills the air—the fragrance may be kept in this way almost a lifetime. When recovering feather pillows used at a beach house, it seemed to me that in spite of sunning and airing a musty odor lingered. Perhaps it was imagination, but a few blossoms dropped among the feathers corrected that. Small sachets for bureau drawers, linen closets, wardrobes, dress hangers, etc., are made in the usual way, with cotton batting covering if soft even surface is desired, or merely placed in tight cotton slips. A very satisfactory sachet is made by cutting stems of even length, weaving together center third into cylinder shape with narrow ribbon, preferably lavender in color. Take cotton batting sufficient to fill woven part of cylinder, fill center of cotton with lavender blossoms, place cotton roll in cylinder, drawing up ribbon at ends to close and tying tightly. These lavender "sticks" are very attractive gifts. By using the lavender stems as warp and ribbon or yarn as woof, simple bags or pockets or baskets may easily be evolved.

---

### Caramel Pudding—Boiled Salad Dressing

I have been a subscriber of your paper for a long time and find many helps in it. Now I would like to ask for some recipes from the household department. Can you give me some recipes for boiled salad dressings and caramel pudding through the Cultivator columns?—Subscriber, Cupertino.

Caramel Pudding—Here is a very good caramel rice pudding: Cook 1 cup rice, 6 cups milk in double boiler 2 hours, add 1 teaspoon salt, 2 eggs slightly beaten and grated rind of one-half orange. Put 1 cup sugar in clean agate ware frying pan and stir continually until sugar becomes golden brown syrup. Pour this hot liquid into hot pudding mold, coating whole inner surface. Add rice mixture, cover and cook in oven in pan of water 20 minutes. Remove from oven, let stand 5 minutes, turn on serving dish and serve with soft custard.

Soft Custard.—Scald 2 cups milk in double boiler. Mix together 4 egg yolks, one-third cup sugar, one-quarter teaspoon salt; add scalded milk to them; return to double boiler and cook until mixture is of smooth creamy consistency. Strain into cold dish and add flavoring when cold. Should custard begin to curdle set immediately in dish of cold water and beat briskly with whisk or egg beater. Soft custard may be made with whole eggs but it is not so velvety.

Caramel Apple Pudding—Melt 1 cup sugar in 4 tablespoons water, 1 tablespoon butter, stirring constantly till brown. Coat pudding dish as above. Mix in bowl 3 cups apple sauce, 1 cup brown sugar, 2 cups bread crumbs, nutmeg or cinnamon to taste. Pour mixture in pudding dish, bake in slow oven 40 minutes, turn on platter and serve with caramel sauce.

Caramel Sauce.—Cook until caramelled 1 cup brown sugar, 4 tablespoons water, 1 tablespoon butter, then add 1½ cups water. Bring to boil and add 4 tablespoons cornstarch dissolved in 5 tablespoons water. Stir till mixture thickens, cook 5 minutes, add 1 teaspoon vanilla.

Boiled Salad Dressing.—Beat slightly 3 eggs, add gradually 1 tablespoon oil, 1 tablespoon salt, ½ tablespoon mustard; when smooth add ¾ cup vinegar, then 1¼ cups milk. Cook in double boiler, stirring constantly until it thickens.

Cream Dressing—Melt ¼ cup butter, add 1 teaspoon each salt, mustard, paprika, 3 egg yolks, 2 tablespoons flour, ¼ cup vinegar; cook until thick. Add 1 cup thick sweet or sour cream. Beat well and chill before using.

---

### Gettysburg Address

Would you kindly publish in your next issue of the Cultivator the following: The complete poem of "Hiawatha" and "Lincoln's Gettysburg Address?"—Subscriber, Elk Grove.

It is impossible to print in the Cultivator so long a poem as Hiawatha. Has not your county a circulating library? If it has, request to Sacramento wil bring this to you.

**Gettysburg Address**

Forescore and seven years ago our fathers brought forth on this continent a new nation, conceived in liberty and dedicated to the proposition that all men are created equal.

Now we are engaged in a great civil war, testing whether that nation, or any nation so conceived and so dedicated, can long endure. We are met on a great bat-

## The Cultivator Patterns

**3666-3962. Ladies' Costume**—Waist 3666 cut in 6 sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. Skirt 3962 cut in 7 sizes: 27, 29, 31, 33, 35, 37 and 39 inches waist measure. To make the dress for a medium size will require 6⅝ yards of 40 inch material. The width of the skirt at the foot is about 2 yards. Two separate patterns 10 cents for each pattern.

**3961. Girls' Guimpe Dress.**—Cut in 4 sizes: 8, 10, 12 and 14 years. A 12 year size requires 1⅞ yards of 27 inch material for the guimpe and 2⅝ yards for skirt and overblouse. Price 10 cents.

**3969. Ladies' House Dress.**—Cut in 7 sizes: 36, 38, 40, 42, 44, 46 and 48 inches bust measure. A 38 inch size requires 6 yards of 36 inch material. Price 10 cents.

**3953. Child's Dress.**—Cut in 4 sizes: 2, 4, 6 and 8 years. A 4 year size requires 3¼ yards of 27 inch material. Price 10 cents.

**3312-2939. An "Up-to-Date" Frock.**—Waist 3312 cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. Over Dress 2939 cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. To make the waist will require 2½ yards of 36 inch material. The Over Dress requires 3½ yards of 40 inch material. Two separate patterns 10 cents for each pattern.

**3960. Girls' Dress.**—Cut in 4 sizes: 8, 10, 12 and 14 years. A 12 year size requires 3 yards of 38 inch material. Price 10 cents.

**3751. Ladies' Apron.**—Cut in one size medium and requires 1½ yards of 27 inch material. Price 10 cents.

**3956. Girls' Middy Blouse.**—Cut in 5 sizes: 8, 10, 12, 14 and 16 years. A 14 year size requires 2¾ yards of 36 inch material. Price 10 cents.

**PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH**

**HOW TO ORDER PATTERNS**

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cent) stamps for each number. In order to furnish our readers with the very best NEW YORK styles, all patterns ordered are filled in NEW YORK. Do not expect patterns under **Two Weeks** from date of order.

**CATALOGUE NOTICE**

Send 12c in silver or stamps for our Up To Date Fall and Winter 1922 Catalogue. This is even better than the Spring and Summer number. It will have 8 colored plates., the same as the last catalogue, but a great many of the other pages will be arranged in plate form, so that the Fall and Winter Catalogue will be more like a fashion book than a pattern catalogue.. It will also include points for the needle and hints for the home dressmaker.

**PATTERN DEPARTMENT**
California Cultivator Los Angeles

tle field of that war. We have come to dedicate a portion of that field as a final resting place for those who here gave their lives that that nation might live. It is altogether fitting and proper that we should do this.

But, in a large sense, we cannot dedicate—we can not consecrate—we can not hallow—this ground. The brave men, living and dead, who struggled here, have consecrated it far above our poor power to add or detract. The world will little note nor long remember what we say here, but it can never forget what they did here. It is for us, the living, rather, to be dedicated here to the unfinished work which they who fought here have thus far so nobly advanced. It is rather for us to be here dedicated to the great task remaining before us—that from these honored dead we take increased devotion to that cause for which they gave the last full measure of devotion—that we here highly resolve that these dead shall not have died in vain—that this nation, under God, shall have a new birth of freedom—and that government of the people, by the people, for the people, shall not perish from the earth.

### Pepper Hash

Please publish a recipe for pepper hash in the Cultivator. I have lost mine. I've had some fine recipes from the Cultivator. — Subscriber, Chowchilla.

One quart chopped cabbage or chayotes, 1 pint chopped white onion, 1 pint chopped sweet red pepper, 1 pint chopped sweet green pepper, 4 tablespoons salt, 4 tablespoons mustard seed 2 tablespoons celery seed, (crushed), ¾ cup sugar, 1 quart vinegar. Soak pepper in brine (1 cup salt to 1 gallon water) for 24 hours. Freshen in clear cold water for one or two hours. Drain well. Remove seeds and coarse white sections. Chop separately, and measure the chopped cabbage, peppers and onions before mixing. Add spices, sugar and vinegar. Let stand over night covered in a crock or enameled vessel. This is eaten fresh as a relish or may be canned as follows for keeping: Pack in small sterilized jars. When ready to pack drain vinegar off in order that the jar may be well packed. Pack relish in jars, pressing it carefully; then pour over it the vinegar which was drained off. Paddle the jar thoroughly to get every bubble out and allow the vinegar to displace all air spaces. Garnish each jar with two quarter-inch pointed strips of red pepper three inches long. Place these strips vertically on opposite sides of the seams of the jar; cap, clamp and boil ten minutes.

## HINTS FROM HOUSEKEEPERS

### Sliced Sweet Pickles—Ice Cream Candy

Sweet Pickles—Wash and slice rather thick 1 dozen medium cucumbers (do not peel), slice two or three onions, sprinkle well with salt and let stand two or three hours or all night, then drain and rinse. Bring to a boil 1 pint vinegar, 1 cup sugar and 1 teaspoon mixed whole spice. Put in cucumber and boil five minutes, then seal.

Ice Cream Candy—Three cups sugar, 1 cup karo or similar syrup, ½ cup water, boil until it forms a hard ball in water, then turn into two stiffly beaten egg whites and beat well. Add vanilla and 1 cup nuts and turn on buttered platter.—Riverside, Subscriber.

### Green Tomatoes—Bleaching Flour Sacks

Now green tomatoes are in I will give some recipes. Green tomato pie is good. Peel, slice and chop fine the tomatoes, let drain, then put on first crust one heaping tablespoon flour in bottom, then fill with tomatoes, one small cup sugar, 1 good tablespoon vinegar and spices to suit. Allspice is very good. Put on top crust and bake in slow oven.

Green Tomato Preserves—Peel, cut in quarters, sprinkle little salt on and set away till morning, then drain and cook for about ½ hour, then put in sugar as for any other preserve. A lemon cut up fine will help, if desired. Cook till thick.

Bleaching Flour Sacks—I saw where someone asked as to getting stains out of flour sacks some time ago. Now I use in my wash water one small tablespoon borax to a pail of water and plenty of washing powder and soap. I take some of this good suds and after washing the sacks in cold water I put them in a pail to soak until next week. Then wash and boil and it takes the stain out, and the borax bleaches the clothes so nicely.

Your recipes are very good in the paper so I am glad to write a few also.—Mrs. R. S. Vliex, Orange.

### Chopped Pepper Pickle

One large cabbage, 1½ dozen large green peppers, remove seeds from half, 6 large onions. Chop all fine and add one half cup salt. Let stand over night. Drain or squeeze dry. Add 2 cups sugar, 2 teaspoons celery seed, half cup white mustard seed. Cover with cold vinegar. Stir often the first day and add more vinegar if needed. This is fine and keeps well. Needs no cooking.—Subscriber, Bell.

Equal parts linseed oil, turpentine and vinegar make a good home-made furniture polish.

First the picture, then the date and title written on the film at the time—the record complete with an

### "LIKE BEGETS LIKE"

Criticism is sometimes directed toward the breeders of registered cattle that they are exhibiting a type of cattle not desired by the producer of market beef. Possibly this may be true in a very few instances, however, the demand for any particular breed of cattle would rapidly wane if it did not satisfy the requirements of the average farmer or stockman, the packer and the consumer.

To breed cattle which will produce the greatest amount of high quality beef in the shortest possible time at the least cost is the ideal the constructive beef cattle breeder has in mind. The ability of the Hereford to "carry on" and the fact that the Hereford breeders of today have not deviated from the ideals of the founders of the breed whose work began nearly two centuries ago has never been more forcily illustrated than at the recent National Western Live Stock Show at Denver.

The grand champion steer of the show was a pure bred Hereford calf bred and exhibited by W. N. W. Blayney. This calf just a few days over a year old weighed 930 pounds and when butchered dressed out 66.66 per cent marketable beef, confirming the judges' opinion of the steer as shown on the hoof.

John Clay, the veteran cattleman, after viewing the carcass wrote for his publication, Live Stock Markets, as follows: "Great interest was taken in seeing how the Blayney champion would kill out. He verified his standing as a grand bullock, one of the best ever, by being awarded the first ribbon on the hooks. Hanging up he showed a smooth excellent carcass. No waste and considering his age handled well."

When later on in the show the sire of this calf was adjudged first prize aged Hereford bull, then grand champion Hereford bull, we see that through his heritage the calf came by his honors quite naturally.

The bull must be an excellent animal as an individual to win the purple ribbon, indicative of the grand championship of the breed, at a show of that character and the fact that he has reproduced himself in kind sufficient to win in competition with all breeds is very staunch evidence that present day Hereford breeders have very closely approached the ideal in their pure bred herds.

Farmers and stockmen from this demonstration can clearly see the value of good registered sires in their herds for the more economical production of beef for the market and at the same time study the type of sire which begets the most profitable steers. Furthermore this lesson is very valuable since its brings to the eye of the breeder of registered cattle the close correlation between the breeder and the butcher.

"Like begets like" is one of the fundamental laws of animal breeding and this grand champion steer sired by the grand champion bull is one of the finest examples of this law ever witnessed at any great livestock show and is a credit to the breeders and the pure bred live stock industry in general.

### AYRSHIRES INCREASING IN POPULARITY

The Southwestern Ayrshire Breeders Association which is composed of breeders of the "bonnie red and white coo" in California, Nevada and Arizona is taking a census of all Ayrshires in that territory. A large number of the breeders have already sent in their blanks properly filled out but there are still a number in breeders' hands. The secretary requests that these blanks be sent in at once so that the results can be tabulated and published. If breeders desire more copies of census blanks they may be had from the secretary by addressing Geo. W. Fry, The Redwoods Ayrshire Farm, La Honda.

The largest herd of Ayrshires in California, according to data now available is that owned by Capt. Harry Gantz at Buellton. This herd consists of 95 purebred animals and 140 grades. The second largest is that of the Le Baron Estate Company at Valley Ford. This is under the management of J. A. Glass and numbers 66 head of purebreds only. Elmer H. Joerger of Foothill Farm, Clarksville, has a herd of 17 purebreds and 80 grades. Secretary M. J. Hughes of the Penobscot Farm whose property is located at Cool near Auburn has turned in a report showing a herd of 55 purebreds.

The demand for Ayrshires (both bulls and cows) is picking up as evidenced by inquiries received at the secretary's office. One of the farm bureau centers of the state has adopted the Ayrshire as its official cow and all the members have agreed to purchase nothing but this breed. This will absorb the biggest part of the females for sale. There are two notable things about Ayrshires. Once a man has gotten together a herd he is loath to part with them and nearly every Ayrshire owner is his own herdsman. Perhaps this is why he loves his breed so much; he has an opportunity to study the individuals closely and learn their many good points.

Several new Ayrshire herds will be seen on the show circuit this fall. Half a dozen new breeders have indicated their intention of going out for the fall shows, and this will add zest and enthusiasm to the show ring competitions which have been heretofore confined to two or three herds. We can count on the J. Henry Meyer herd,

### HOG PRODUCTION IN CALIFORNIA

In view of the fact that California is noted for climate, oranges, lemons, walnuts, boulevards and the widest variety of commercial luxuries known anywhere in the world, the topic of agriculture in general, hog growing in particular, is generally not given much consideration. The Middle West having risen to such heights in the production of hogs and hominy has more or less stolen our thunder along these lines. While it is true that California produces less than one-third of the pork she consumes the quality is equal if not superior to any produced anywhere. It is but recently that this could be said of our pork. In the past too many hogs have been grown as "just hogs." The discouraging but conscientious work of the pure bred enthusiast is beginning to tell, and the packers are unanimous in their statement that the quality of pork we produce is far superior to that grown five years ago. A prominent packer was recently asked what were the reasons for the improvement in our pork and he mentioned three things, viz., more scientific feeding, the system of grading as practiced by our various farm bureau units, and last but not least the infusion of pure bred blood into our herds. Now that we have adopted methods of producing a high grade product the future of the hog in California is entirely up to us. The natural advantages in this state for producing economical pork are greater than anywhere else in the world. We have water, land, mild climate and an unlimited variety of necessary feeds. It is no credit to us to say that we can grow as good a hog as they can grow in the East. With our favorable conditions we should be able to outdistance any other state in hog production, and we can easily do this if we will give careful attention to feeding, breeding and selling. It is not difficult at the present time to make real good profit on hogs even where all the feed has to be purchased, providing the hogs are pure bred. It is not necessary that they be registered or show animals, but if we wish to avoid a loss we must stay away from the scrub.—Geo. A. Stingle.

### HOW DOES DAIRYING LOOK TO YOU?

There is a diversity of opinion with reference to milking the lowly cow. Some dairymen view this job as drudgery, others as a harvest time when the returns of their labor are collected, and they can check up on their feeding investigations and the quality of their livestock. It all depends on whether the milking barn is a sweat shop or a laboratory, whether the dairyman is a drudge or a scientist, whether the dairy herd is an eyesore or a pride, whether the herd sire is a purebred and one to be proud of, or a scrub and an abomination. In one case dairying is a gamble, while in the other it is an interesting and profitable business.

If the dairyman is a scientist his barn is a laboratory or manufacturing plant where every cow is a unit that must show efficiency or be eliminated. The science of dairying comes in the study of effects of feeds on production of cows and in noting the results of certain ways of milking and handling the cows to determine the best methods for economical production, also in the breeding and developing of heifers that are more efficient than their dams and in handling the product so that it will be a pure and safe food.

The business side of dairying includes the keeping of production records of each cow and her heifers and cost of production records to check up on the efficiency of the animal as well as on the food. From the knowledge gained by such records, the business dairyman knows the value of his serd sire. He knows whether it pays to grow or buy certain feeds, and how to improve the efficiency of his herd and to keep down overhead expenses. It also includes the marketing of the products to get maximum returns and the buying and selling of livestock.

There is no permanent place in dairying for the man who will not apply scientific and business principles to his herd of cows. Of all branches of agriculture, dairying is the most complex and exacting. It requires a high degree of skill, patience and application. Yet no other branch of agriculture can give greater satisfaction and profit, if properly managed.—J. E. Dorman, dairy division, U. S. D. A.

### MEDITATIONS OF A SCRUB BULL

They call me a scrub bull; yet I have a pedigree. I was sired by a scrub, dam'd by a scrub and am treated like a scrub, and I sometimes think that I am owned by a scrub. My tribe outnumbers purebred bulls four to one. Just why I should exist is a mystery even to me. Yet, I am not responsible for it. I was brought into the world without my consent and I shall probably leave it against my will. In the meantime I am getting the most vicious publicity, principally through the farm press. They say I am a renegade and an abomination and should be exterminated. Dairymen passing my owner's farm look at me with contempt; even the cows show me no respect. My own daughters seem to hold a grudge against me, saying that I am responsible for their low production. I cannot argue the point, for it is true. But what can I do? My owner must think a lot of me personally or he would not continue to support me. knowing that I can never improve the quality of his herd or be a source of profit to him. These cow testing associations are certainly showing me up, and I can see the handwriting on the wall. My tribe is doomed! Under the keen competition and low prices of good purebred bulls there will soon be no place on the farm for me. So goodbye. I may be gone but not forgotten, for I have retarded the development of the dairy industry for many years.—J. E. Dorman, U. S. D. A.

### PUREBRED AND THOROUGHBRED

In discussions with reference to the blood lines of certain cattle it is not unusual to hear the animals referred to as "thoroughbreds." The California department of agriculture calls attention to the fact that the word thoroughbred is the name of an English breed of horses and is in no wise applicable to blooded or pedigreed animals in general. All animals of pure strains are know as purebreds, including the Thoroughbred. It is therefore correct to speak of a purebred Thoroughbred when referring to a particular breed of horses, and in such instance the name of the breed is regarded as a proper noun and is capitalized. As a further example a pedigreed Holstein cow, a Berkshire hog or an Airedale dog is purebred but never a Thoroughbred.

### THE FIGHT AGAINST TUBERCULOSIS

At a recent meeting in Chicago of packers and representatives of livestock exchanges an agreement was reached with the Big Five packers and many small packers wherein they agree to pay ten cents a hundred above the market price for hogs free from tuberculosis and which come from farms where neither hogs nor cattle are affected with the disease.

The news is of particular interest to California as this state already has in operation a free area plan for eradicating tuberculosis from several counties and also the accredited herd plan which is receiving favorable consideration in various sections of the state. With the accomplishment of the desired results through the plans now in operation, the work of eradicating tuberculosis from swine will become comparatively easy since a large number of hogs become infected either directly or indirectly through cattle having the disease. The packers who entered the agreement are to be commended for the action they have taken in offering the farmer further encouragement in eradicating a disease which was seriously threatening the destruction of the livestock industry in this country.

# Prince Aaggie of Berylwood

The highest yearly record bull in service for his 7 nearest dams in the world.

His 7 nearest dams with his dam's heifer record average 1122 lbs. butter, his dam freshened last December dropping twin heifers—she made 37 lbs. butter in her second month—she should finish this year with over 1200 lbs. butter, adding greatly to his already high average.

We have decided to take him on the fair circuit. He will be at Stockton, Sacramento, Tulare, Ventura, Riverside and Pomona—arrangement could be made at the above mentioned fairs for service to select cows. Be sure to see him.

## Livestock News Notes

### LIVESTOCK SALE CALENDAR

**Holsteins**

September 21, Dispersal, E. Maracini, Dos Palos.

September 28, Dispersal, Carl Ray, Lankershim.

October 26,, Draft C. W. Anderson, Burbank.

November 16, Dispersal, Arthur & Maxfield Holstein Co., Hanford.

W. J. Higdon has a number of daughters of King Korndyke Pontiac 20th on test this year, and they promise to be all that he expects of them. A three year old will finish shortly with over 1000 pounds butter for a year, and a number of two year olds will have between 700 and 800 pounds butter in 305 days.

The district around Pomona and Ontario will be well represented at the state fair. Harry H. Cook will take 15 head of Financial Interest Jerseys; the Italian Vineyard Company will show 15 Guernseys and about 30 Berkshires, and George Junior Republic will show a fine string of Holsteins, including Dichter Spofford Korndyke Lad 5 who was grand champion last year. Chester A. Johns of Ontario will also take a carload of dandy Berkshires.

The dairy interests of the state will be interested to learn that the directors of the California and Southwestern States Ice Cream Manufacturers Association have voted to hold their annual convention at Fresno during the Pacific Slope Dairy Products Show, November 13-18. It is practically assured that the California Creamery Operators Association, California Dairy Council, California Milk Dealers Association, and California Butter, Cheese and Ice Cream Makers Association will also meet in Fresno.

Juliana Colantha Johanna, a junior three year old daughter of Colantha Aaggie Sir Johanna, owned by Charles Harrington, Compton, has completed a 365 day record of 800.11 pounds butter from 16,671.3 pounds milk. Mr. Harrington has one of the best herds of yearly record females in the state, with records ranging up to over 1,000 pounds of butter, and others now on test and going strong.

Rosamaines Novena Netherland, calving at 2 years, 3 months, has completed a 365 day record of 845.76 pounds butter from 20,593.3 pounds milk in the Sierra Vista Stock Ranch herd at Perris. She is a daughter of Rosamaines Pontiac Netherland, the good proven son of King Pontiac Netherland Segis 3d, and is out of a daughter of Prince Aralia Walker, whose dam is Aralia De Kol 3d, an 1,100 pound daughter of Aralia De Kol. This adds one more to California's rapidly growing list of 20,000 pound two year olds.

Glenwood Stock Farm, Riverside, in which A. J. Stalder, Charles Dundas and others are associated, has been equipped with buildings and corrals of the most practical character, laid out on a unit plan that can be made to accommodate 500 head of registered Holstein milk cows. The present herd numbers well over 100 head, of which quite a percentage are heifers under milking age, among them about 25 young daughters of the great proven sire, King Pontiac Netherland Segis 3d. While no attempt has been made to erect expensive buildings for show purposes, yet no expense has been spared to secure permanency and the highest degree of sanitation, as the herd will be called upon to furnish in volume the highest quality of milk yet available to the consumers of the city of Riverside.

Three of the high record cows in Bridgford Holstein Company herd at Patterson, have recently repeated with records above 30 pounds butter in seven days. The famous Adirondac Wietske Dairy Maid, calving this time at 10 years, two months, dropped a husky pair of bull calves, and on official test made 31.06 pounds butter from 717.5 pounds milk, although it was not expected to run her on test at all following the recent completion of her second record above 1,000 pounds butterfat in one year. Lyons Prilly of Donnybrook, calving at 6 years, increased her former butter record, making 31.48 pounds butter from 543.5 pounds milk in seven days. Nattalene Walker, holder of the world's milk record in the seven day division of the junior three year old class, calving at six years, also increased her previous butter record, making 34.63 pounds butter from 694.3 pounds milk, thus gaining to her credit three records above 30 pounds, two of which are above 34 pounds.

Segis Pontiac Charlotte De Kol, owned by F. F. Pellissier, Whittier, has completed an official record of 20.19 pounds butter from 513.8 pounds milk in seven days as a senior two year old. She is a daughter of Segis Pontiac De Kol Burke.

Juliana Canary Mercedes, calving at three years, twelve days, has completed a yearly record of 1,018.35 pounds butter from 26,078.9 pounds milk. She is sired by Prince Juliana Walker, son of Prince Gelsche Walker out of a daughter of Juliana King of Riverside, second dam, a daughter of the great

### STOCK AT THE STATE FAIR

Livestock men are in possession of the strip through the center of the grounds from the fat pens at the north end with Guernseys, Jerseys, beef classes, swine, sheep and goats, and past the main buildings with Holsteins, and horses and ponies at the extreme southern end.

They're worth a million. They're beauties and an inspiration to farmer and breeder.

*Extra Ply of Fabric—Extra Heavy Tread*

**FISK RED-TOP CLINCHER TIRE**

Trade Mark Reg U S Pat Off.

**Time to Re-tire? (Buy Fisk)**

A BIG, husky lumber jack stepped into the store of a western dealer and asked the manager if he could exchange for Red-Top the tires which come on a car he was going to buy, he to pay the difference in price.

He said the Red-Tops on the car he was driving were two years old—that they had not had a puncture yet, and that "nobody could ever talk him into any other kind of tire if he could possibly get "Red-Tops."

Where the going is rough or the loads heavy, there is no other tire in existence which wins as many friends as the Red-Top, whose extra ply of fabric and heavy red tread put it in a class by itself.

*There's a Fisk Tire of extra value in every size, for car, truck or speed wagon*

foundation cow, De Kol of Valley Mead. This latest 1,000-pound California heifer is owned by Sierra Vista Stock Ranch, Perris, which is the property of the famous author, Peter B. Kyne.

### ORANGE COUNTY FAIR

Thursday, September 28, will be a day of particular interest to livestock owners and breeders at the Orange County Fair, Santa Ana, for on that day the livestock department will stage several events for the entertainment and inspection of fair crowds, including a load pulling contest, and a one night horse show.

Plans for the livestock features were made by the livestock committee headed by E. G. Stinson of Orange, Chas. F. Heil, Floyd Scott, and heads of the farm bureau. It was decided to hold the competitive load moving contest on Thursday afternoon, September 28. Cash and ribbon prizes will be awarded the best four horse or mule team and best two horse or mule team moving heaviest load on stoneboat from standing start. The livestock department has never before been featured as it will be at this year's fair, and with the cooperation of breeders it is expected this department will make a splendid showing.

### FAIR AT DELHI

The people living on the Delhi state land settlement are to have a fair September 16 at which time visitors will be given an opportunity to see the good stock owned by settlers and the crops grown the present season. A drive over the settlement will also be arranged. A number of members of the California Development Association are planning to visit the fair and the association itself has generously given $100 to be distributed in prizes as follows:

For the best farm, $15.00 and $5.00; vineyard, $15.00 and $5.00; orchard, $15.00 and $5.00; dairy herd, $15.00 and $5.00; farm laborers' allotment, $15.00 and $5.00.

The Delhi settlement is the home of some fine dairy herds. During the present state cow testing competition, the Delhi herds have topped the list for five out of seven months that the competition has been going on. Recently breeders have been paying high prices for some of the young stock of the settlers.

### PUREBRED BREEDERS PICNIC

The Southern California Purebred Livestock Association held a mid-summer picnic at the Santa Monica dairy of H. Michel. There was general discussion of matters pertaining to building up the livestock industry and an address by Prof. Gordon H. True of California University. Prof. True referred to the importance and magnitude of the livestock industry and said that without the livestock industry agriculture would practically cease. One point made to show the importance of the industry was in a reference to the history of agricultural and other events as they have occurred on this Pacific slope. Prof. True referred to the discovery of gold and its effect upon a country's advancement and to the fact that California's hillsides have been thoroughly mined in order to secure their gold. Later the valleys were "mined" in order to produce wheat, and for years there was shipped from the Golden Gate the wonderful fertility of California's valley land. Many of these lands once so rich are today practically worthless because of the "mining" methods used in producing wheat. Now some of those acres are being reclaimed or built back into productive soils again by the introduction of livestock. Of course Prof. True showed wherein the livestock industry is made more productive through use of highest quality of purebreds and elimination of the scrub. Better marketing methods was touched upon for Prof. True realizes that without proper marketing facilities highest grade producers are of little value.

The association passed resolutions endorsing a suggestion made by Prof. True that the state legislature be asked to provide funds for the employment of six additional livestock extension specialists, three of whom should specialize on beef production, two on dairy production and one to give his entire time to the swine industry. The committee having to do with the livestock survey of Los Angeles and Riverside and Orange Counties presented progress report.

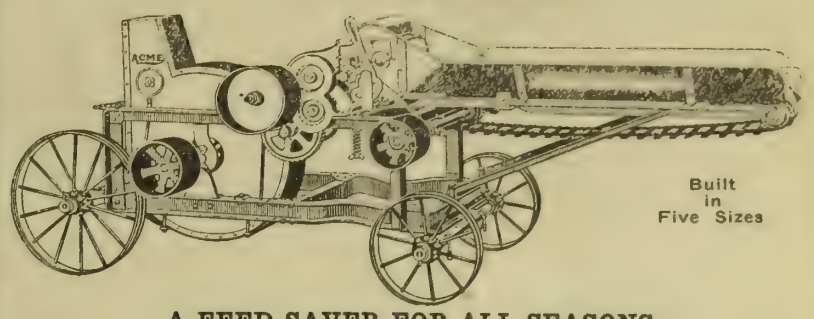
ACME
The Combined Silage Cutter
Hay Chopper and Alfalfa
Meal Machine



Built in Five Sizes
A FEED SAVER FOR ALL SEASONS
What Some of Our Customers Say:
"Have found machine quite satisfactory for every purpose I have used it for. Have used it two years for chopping hay and filling the silo."—E. D. Rowe.
"Our No. 17 Acme has filled 16 silos and is as good as new."—P. N. Ebsen.
"We use it only for chopping hay and find it satisfactory."—J. R. Long.
"Your cutter sure does good work."—M. H. Centemann.
"Used the No. 14 Acme 4 years. We don't need another. This one is all right. It has filled 12 silos."—W. L. Little.
"We use the Acme on rye hay and corn. It does the work."—H. D. Whitmore.
Here are a few of the special features which go to make the Acme a distinct leader in its line:
1. Its "lawn mower type" cutting knives produce that better quality silage—clean-cut, short and uniform.
2. The triple frame entirely of steel means durability and freedom from vibration.
3. Absolutely safe—cannot "blow-up."
4. Requires less power for a given capacity than other cutters.
5. A size for every requirement as to power and capacity.

WE OFFER

# AT PRIVATE SALE, AT THE FARM

## Singly or in Groups
## ANY 50 HEAD of Registered Holstein Cattle in Our Herd

*You Pick Them Out: We Will Sell Them*

This offer is made without reservation and includes every one of our State Champion and World's Record cows, among them:

KIATTA PONTIAC PRIDE (world's record junior 4 year old for 365 day milk production), 1,134 lbs. butter, 31,491.6 lbs. milk in 365 days. 34.46 lbs. butter, 747.4 lbs. milk in 7 days, and two of her daughters.

IRENE SEGIS PONTIAC, at 4 years, 1,008 lbs. butter, 23,301.7 lbs. milk in 365 days. At 5 years, 33.03 lbs. butter, 76 lbs. milk in 7 days. Now making the largest combined milk and butter record ever made in our herd; has 551 lbs. butter, 14,094.3 lbs. milk in 136 days, averaging over 103 lbs. milk and 4 lbs. butter per day. A sister to Kiatta, both being sired by a son of a 1,470 lb. yearly record cow.

LOIS BERYL PRIDE. California State Champion and fourth highest in the world for seven days milk in the senior 4 year old class. 837.4 lbs. milk, 29.03 lbs. butter in 7 days. She is running in long time test and has to her credit over 500 lbs. butter in 169 days. Another sister to Kiatta.

FANNIE PONTIAC BUTTER GIRL PRIDE, California State Champion for seven day milk production in the junior 4 year old class. 751 lbs. milk in 7 days. She is running sensationally in long time test and has to her credit 20,700 lbs. milk and 720 lbs. butter in 228 days.

SEVERAL SISTERS to the above that have made good seven-day records and have made or are now making year records up to 1,100 lbs. butter.

JOHANNA PRINCESS MOOIE 2d at 3 years, 1,172 lbs. butter, 25,596.5 lbs. milk in 365 days (world's combined milk and butter record when made—still 2d highest in the world for butter). She has two three-year-old daughters with 28.87 lbs. butter and 30.03 lbs. butter in 7 days.
Sisters to Johanna Princess Mooie 2d.

THELMA HARTOG SUNLAND DE KOL 4th. 32.08 lbs. butter, 728 lbs. milk in 7 days. 1,134 lbs. butter, 27,000 lbs. milk in 365 days.

DAUGHTERS AND GRAND-DAGHTERS of Laurameka, 1,326 lbs. butter, 29,899 lbs. milk in 365 days; ROXIE PAULINE BURKE HENGERVELD, 1,188 lbs. butter, 25,175 lbs. milk in 365 days; JOHANNA PRINCESS MOOIE 2d, 1,172 lbs. butter, 25,596.5 lbs. milk in 365 days; KIATTA PONTIAC PRIDE, 1,134 lbs. butter, 31,491.6 lbs. milk in 365 days; THELMA HARTOG SUNLAND DE KOL 4th, 1,134 lbs. butter, 27,000 lbs. milk in 365 days, and a number of cows now running sensationally in long-time test.

LAST YEAR we made some of the largest records in the United States.
THIS YEAR we are going stronger than ever.
The test strings will be kept in test until sold.

THIS OFFERS A WONDERFUL OPPORTUNITY TO TAKE OVER THE TEST COWS AND COMPLETE SOME OF THE LARGEST RECORDS EVER MADE IN CALIFORNIA.

# Finding a Market for Purebred Livestock

By Bruce S. Bennett

UNDOUBTEDLY the greatest problem facing the breeder of pure bred livestock is that of finding a market for his product. The manufacturer or merchants faces the same problem. The same methods used by a manufacturer will in a general way apply to the breeder. In the majority of cases, no matter what the article, a market or demand must be created. Just what method is best for any particular breeder depends largely on local conditions and the means at his command.

There is only one way any business that depends on selling for its success can be made profitable, and that is by advertising. By advertising, we do not mean a mere announcement in some paper that you have such and such for sale, but advertising taken in its broader meaning. Advertising for the breeder may mean any one of several things, among the more successful being showing at fairs, advertising in the farm press, your local paper, circulars and private sale catalogs and public sales. The more of these used the greater the volume of business. But, this should be backed up by personal solicitation.

A good mailing list is one of the strongest links in the chain of business building. These lists should be made up of the names of the farmers in your own county and the counties surrounding you. These are not hard to get, and can be added to month by month until they cover the entire state or several states. Advertising in the farm press will give you a large number of names for this list, and by personal work and inquiry more can be added to it.

It would not be a very hard undertaking to secure the name of every farmer wihtin a radius of 100 miles of your farm that would likely become interested in what you are breeding. This list should be used at least four times a year in some way, if only by a friendly letter, and when you have anything for sale a good sale catalog will nearly always help you secure a customer.

The trouble, however, does not lie in the means or methods at hand, but the unwillingness of the breeder to do these things that are vital for his success.

What would you think if you went into a store and the merchant or one of his clerks told you they did not have time to wait on you this morning? How long would that merchant last if he pursued such a policy? Ninety-nine out of every hundred breeders will tell you they haven't time to do these things. Do you suppose that is why only one in a hundred that starts makes a success? Isn't a business worth having, worth working for?

A few minutes each day will keep up a mailing list. A few minutes when in town spent with the editor of your local paper will keep your name before your local prospects. During the season when you are not too busy spend a day or so now and then visiting in your neighborhood or county, meeting new farmers and leaving a circular or card, an invitation to visit your farm and see the kind of animals you are breeding. These things, combined with your general publicity in the farm papers, will put you in touch with possible customers. It is then up to you as to whether or not the sale is made.

Another very satisfactory method is that of public sales. In the minds of many breeders the public sale is not only the quickest, but the surest method of finding a market.

It has many advantages, among them being a quick turnover of your surplus stock. Once or twice a year, depending upon the extent of your operations, you can clear your farm of all salable stuff, get your money all at one time, and eliminate a lot of the detail necessary in a direct mail order business.

To my mind this is one of the most successful methods that can be used. By judicious advertising in the farm press and showing at the fairs you get your name prominently before the people, and when your public sale is announced they are willing to accept your offering. It also tends to instill confidence in you as a breeder when you are willing to let the public be the appraiser.

One should not expect too much from his first sale, and if the offering is up to standard each succeeding sale should be better than the last. We have some excellent examples in this state of what public sales, rightly managed, will do for the breeder and the breed.

Farm products do not grow without proper cultivation, and neither will a breeder's business. California offers unlimited opportunities to the breeder who will work with his brains as well as with his hands. The manufacturer when he wants business goes after it. I remember reading in Frank Hastings book "Recollections of a Ranchman" about a Scotchman who worked for the Armour Packing Co. Mr. Armour was telling him what he must do to to increase sales. He replied, "Impossible, Mr. Armour, impossible, but we'll do it." The business is here, will you go and get it?

# Scientific Hog Breeding

When the majority of farmers and breeders start in the pure bred hog business they buy a bunch of sows of a good type and a boar of a family popular at the time, and let nature take its course. Sometimes, very often in fact, these animals nick well and produce good pigs. If it were not for this happy coincidence progress in the hog business would be slight, because few men give real study to mating and rely principally on culling to raise the standard of their herds.

There is one man in California who stands out as a hog breeder much as Burbank does as a plant breeder, and that is Francis J. Underhill of Santa Barbara. Mr. Underhill brought to the hog business the experience of years of breeding and showing horses and cattle. He is a thorough enthusiast along livestock lines, and his work cannot be overlooked.

When he first figured on becoming a hog raiser he was undecided as to which breed to adopt, and after considerable correspondence with close friends among the big packers he adopted the Hampshire, because they generally favored that breed, although pointing out that it had many faults, among which was poor feet and bone, and the fact that many excellent animals had to be discarded because they were not perfectly belted.

Producing livestock with a distinguishing characteristic, such as the belt on the Hampshire or polled Hereford cattle is a difficult task, as they have not been bred long enough to get away from frequent throwbacks to the original animals.

Mr. Underhill assembled the best sows he could get along certain blood lines which to his mind were the best, procured the boars he wanted and began his experiments. He traced back all of the great animals of the breed, noted the matings which produced them, and followed a similar course.

He is now getting the third generation of animals of his own breeding, and they prove that his ideas are sound. He can prophesy almost to a certainty that certain sows mated to certain boars will produce the proper type of hog belted perfectly. He also knows that these same sows bred to other boars will fail to do this, and as a check on his theories he has mated them as he knew they should not be mated in order to prove his point.

This has been expensive to him, as invariably the litters have not turned out well, but it has been valuable as a check upon his methods.

The Underhill Hampshires are not yet what he wants them to be, but they are a wonderful improvement over the hog he started with. They are extremely high backed and good sided, and have real feet and bone, and come uniformly belted.

Because he has been engaged in ex-

**The cream of cream separator prosperity goes to De Laval users**

There was never greater need than right now for the best separator, one which skims cleanest, has greatest capacity, turns easiest, requires the least care, and produces the most perfect product. In all these respects the De Laval has no equal. Take nothing for granted, simply let it be demonstrated to you. See the local De Laval agent or address the nearest general office.

**De Laval Pacific Company**

**DISPERSAL REGISTERED HEREFORDS**

30 Bulls—25 Females

**Diamond Bar Ranch**
Spadra, Calif.

**Tuesday, Sept. 26, at 1 p.m.**

The foundation of this herd came from the noted Gov. Packard herd in Arizona, a herd composed of the breed's most famous blood lines.

Most of the bulls in the offering are rugged, range raised fellows, ready for heavy range service.

The females include bred cows, cows with calves at foot, and bred and open heifers.

perimentation previous to this year the Underhill herd has not been shown, but he thinks he has achieved sufficient success to take out a herd this fall and it will be at the principal fairs.

Along with his work in developing type he has worked on easy feeding, and his March pigs will be shown at the state fair weighing 200 pounds at an average age of five months and 20 days, and not fat.

### LIVESTOCK AT RIVERSIDE

Each year a marked increase is noted in both the number and grade of livestock at the Southern California fair, but this year the indications are that all previous records will be broken. The present barns must be enlarged and more constructed to hold the stock that is being prepared to make the big show. Secretary Van Pelt is preparing to break into the big stock circuit by a special train to and from the fair which will bring exhibits in the big beef breeds which have never before reached that section. A great show of dairy stock is in prospect and each of the leading breeds will make a much bigger showing than ever before, and those who are well acquainted with the situation say that the largest showing of Holsteins, Guernseys, Jerseys and Ayrshires that has ever been made in the state will be shown at Riverside this fall.

### BE A BOOSTER

Why does one community excel another in the production and sale of purebred livestock? In that community they are all boosters. Once in awhile you find a breeder who thinks that if he was the only breeder in that section he would have a big business. Find a place where there is no competition and you will find a place where there is no business. When a purchaser arrives at the farm and cannot find just what he wants drive or direct him to some of your neighbors where he will find it. He leaves with a pleasant thought for your community and is a booster for you. You are boosting your community and being boosted. Be a Booster.

The news columns of the dairy and farm journals have recently been filled with accounts of worlds records being broken in dairy producion. In the opinion of many breeders the time is not far distant when there will be a new classification in Advanced Registry, one that will give the owner of the herd a broader basis for measuring the productivity of his herd as a whole than is now afforded. Why not an official classification for the whole herd?

### BRANT HEIFER ESTABLISHES WORLD'S RECORD

Clarabelle of the Rancho, a junior three year old Guernsey heifer owned by the Brant Rancho at Owensmouth, has just completed a year's record of 725.14 pounds butterfat from 11,890.6 pounds milk, which gives her first place in the E E division by a considerable margin. Her paternal sister, Lucky Girl of the Rancho, also recently completed a record of 670.03 pounds fat from 14,913.9 pounds milk, and thus ranks third in the same class. Both heifers carried calves for 265 days of their lactation periods.

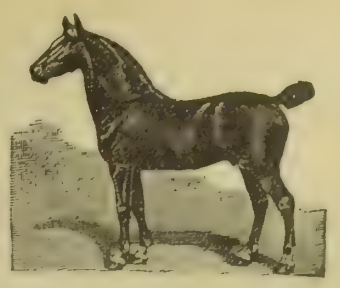
The sire of these young cows is Brookmead's White Face and their performance marks him as one of the greatest transmitting young bulls of the breed.

### MINNESOTA CREAMERIES HAVE TRAFFIC EXPERT

Cooperative creameries of Minnesota today have their own traffic expert on duty in New York.

The Minnesota Cooperative Creameries Association, Inc., has employed Hubert I. Stack, experienced traffic manager, as head of its eastern traffic department. He will take charge of the distribution of Minnesota's cooperative creamery butter shipments on the New York market. The state association is beginning to ship butter from Minnesota to itself in New York, so that as the direct representative of the dairy farmers it can check up on all freight bills and attend to all claims for overcharge, loss, damage, incorrect grading, and every other phase of terminal marketing where the individual producer stands a chance to lose money.

***Keeping Your Horse In Perfect Condition***



NO horse with a Spavin, Splint, Ringbone, Curb, Bony Growth, Capped Hock, Wind Puff, Strained Tendon or Sweeny can compete with his physically perfect mates, either in achievements or endurance. Splendid looking horses—otherwise sound—often fail because of some blemish that could be quickly removed with

### THE STATE FAIR FROM AN EDUCATIONAL STANDPOINT

(Continued from Page 219)

teresting to pass from one to another noting the various animals, groomed to the highest state of perfection, and to realize what may be done through careful handling of high grade stock. This in itself is an educational inspiration of no small value, for who can see the mammoth hogs, deep coated sheep, the massive bulls and cows, the splendid poultry, the great Belgian, Shire and Coach horses without determining to improve his own stock?

In the manufacturers' building will be found the latest and most improved methods of conducting the home and making it easier for the housewife to pursue her daily duties. Washing machines of various models, sewing machines with the latest attachments, wall beds, oil burners, stoves and ranges with all modern conveniences, and many other accessories present an ever increasing spectacle of household convenience and economy.

There are, of course, countless other educational features which go to make the fair amazingly beneficial to one who will give a portion of his time to learning something of the improvements which have been made and of which he can make profitable use. As one passes from building to building and down the various aisles his eye will be attracted to various exhibits in which he will be intensely interested.

The fair means much to one who goes with the purpose of gaining from it all he can in an intellectual way.

### WHAT YOU WILL SEE AT THE STATE FAIR

IF YOU are fond of races, and nearly everyone is, you can certainly have your fill at the state fair, for every afternoon on the great track you will see ponies, cowboys and Indians, bare-back riders, trick horses and other features which keep the big crowd of ten to fifteen thousand on the very tip-toe of expectancy and interest. Starting with the sulky races, the show continues throughout the afternoon and closes with some spectacular event, which gives a one hundred per cent thrill to everyone who is fortunate enough to be within sight of the great arena. Before the war the great climax was reached when two locomotives, each going from 30 to 35 miles an hour, met head on in a wreck that sent each of the moguls to the scrap heap with whistles blowing and steam spouting from dozens of places that had been broken open by the great crash. But the war put a stop to this tremendous waste of steam energy and since that time the big event has been a leap from an aeroplane several thousand feet in the air.

#### Agricultural Products

The main agricultural and horticultural building is crowded with exhibits from nearly every county in California. Beautiful designs in fruit, archways of decorations, miniature houses constructed of fruit, and piles of fruit in various designs meet the eye at every turn. The very air is permeated with the fragrance of the finest products of California's soil. Cooling beverages, made from the juices of these splendid fruits, may be had in abundance. The fish and game commission has a life exhibit of the different kinds of fish taken from our many streams and splendid set pieces of the wild animals which inhabit our forests. The great gallery is filled with supplementary exhibits of various kinds.

#### "Power on the Farm"

The tractor and implement tent, known as the section of "Power on the Farm," contains many different tractors, plows, harrows, subsoilers and other agricultural implements which are worked in conjunction with the tractors. A complete guide to all these exhibits may be had for the asking, and the attendants are always glad to explain whatever points may be under consideration. This tent contains over 60,000 square feet, and every inch of space is occupied with an exhibit which cannot fail to arouse keen interest on the part of all of the visitors. To the man who is contemplating the purchase of a tractor this exhibit offers an opportunity of studyinig the various makes and determining which is best suited to his requirements. The big pump tent, which adjoins the main tractor tent, contains pumps of many sizes and they are all busy.

Adjoining the tractor tent are half a dozen large barns in which are housed some of the greatest horses that California is producing at the present time. From the lithe race horse, which every afternoon tears madly around the track at a record-making pace, to the big Belgian draft horses, every quality of equine beauty and utility is represented.

The dairy barns are typical of the best in equipment and service. Cows of all dairy breeds are exhibited.

#### Manufactures

The manufacturers building always attracts a great deal of attention. Household equipment from the parlor to the kitchen is shown to best advantage and the modern improvements which have been inaugurated within the past several years are adequately displayed and fully explained.

#### Poultry Show

A splendid poultry exhibit is always one of the main features of the fair. In a large building occupying over 1,000 square feet are assembled representatives of every breed of poultry and pigeons in California. This complete exhibit brings together those competitors who have studied methods of producing better poultry, and they vie with each other in keen competition over the many prizes which are awarded by the state fair management. The state game commission

horse profits

No. 6 of a Series — Published Monthly in the Interests of Better Horses and Better Harness — Louis Lichtenberger, Editor

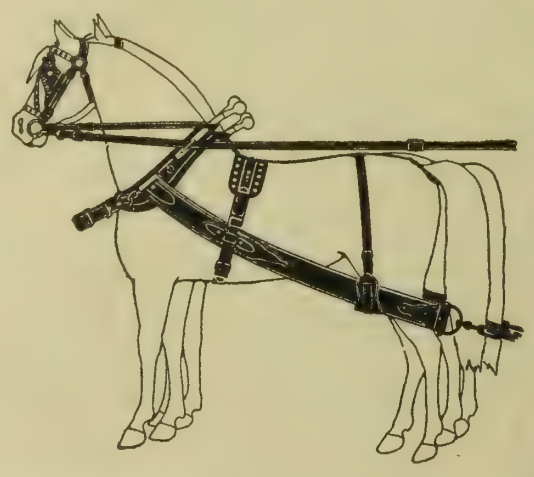
# It Pays to Select Good Harness

The amount of work a horse will deliver depends largely upon the harness it wears. You can't expect your horses to give their full quota of efficiency if their harness does not fit right. Superior Brand Harness has the custom-made fit. It is produced in adjustable sizes for every horse's need. Every whit of leather used must first pass exacting tests for texture, tensile strength and pliability. Every friction seam has been eliminated and all parts are fashioned to satisfactorily fit the contour of the horse. Special insulated linen sewing cord is used—the kind that will withstand moisture and sweat. Superior Brand Harness may cost a little more but it's worth the difference.

## Headquarters For Saddlery and Miscellaneous Equipment

In addition to our complete line of harness we produce saddles of every description. These are constructed on special formed trees and are guaranteed not to hurt the horse's back. The Superior Line also includes:

| | |
|---|---|
| Bridles | Cartridge belts |
| Chaps | Saddle strings |
| Saddle bags | Latigoes |
| Saddle Pockets | Hat Bands |
| Leather cuffs | Cinchas |
| Spurs and spur leathers | Riattas |
| Rifle scabbards | Stirrups |
| Pistol holsters | Saddle Blankets |



## Style 338—Team Harness

A sturdy set that the heaviest draft horse can not strain. Doubly reinforced thruout and finished custom-built style. The finest work set that money can produce. Ask your dealer to show you this Superior model or request detailed information direct.

## FARM LAND FOR SALE

SUTTER BASIN LANDS

In the heart of the Sacramento Valley, rich, deep "river bottom" soil, with a complete irrigation system is offered to good farmers. Any crop you may want to grow will find a good home here. Most liberal terms.

SUTTER BASIN COMPANY,
304 California Fruit Bldg.,
Sacramento, California.

**For Sale by Owner**—100 acres of the best apple and pear land in the Tehachapi Valley. This is watered by gravity spring creek water and is fine sandy loam. A real opportunity at $200.00 per acre. Has been in trees and alfalfa and proved good. Come at once if you want something good. Address J. B. McConaha, Monalith, California.

**For Sale**—Five acre home in prunes, olives, fruit and alfalfa. Modern 8 room house, phone, bath room and screen porch. Electric pumping plant and two wells. Plenty of water. One-fourth mile from city limits. Also ten acres of grain land. Owner, Mrs. E. Winnie, Corning, California.

**For Sale**—97 Acre Prune and Olive Orchard interplanted with seedless grapes, bearing. Modern Bungalow and pumping plant for irrigation. Located near Woodland on paved highway. Price $30,000—terms if desired. Call on or write Wm. Gould, Woodland, Yolo County, California.

**Paradise, The Orchard Home Place**—Water, electricity, telephone, good roads, healthful climate, reasonable prices. Box C. Publicity Committee, Paradise, California.

**Florida**—Information Indian River Section; book 148 illustrations and letter five cents. Goodwin & Baker, Realtors, Fort Pierce, Florida.

**For Sale**—Ranches, Homes, Acres, free list. Wilson Bros., Santa Cruz, California.

## GOVERNMENT LAND

**Attention:** Million acres Government land for farming, grazing, timber. Near R. R. Plenty water. Send for folder. Rally, 1111 So. Alvarado, Los Angeles, California.

## MACHINERY

**For Sale Reservoirs, Grain Bins**—We have several big redwood tanks. Cheapest thing money will buy. Tanks, 2,000 bushel capacity, $68; 6,000 bushels, about 3,500 sacks, $125. Cement reservoirs crack. Quakes don't hurt wood tanks. 12,000 bushel capacity, $195 on cars. L. A. make, new galv. tanks, 10 sizes, 175 to 2,000 gals. at $45.25; 1,000, $35.25. Also rebuilt tanks. Pumps at lowest prewar prices. Windmills, tanks, pumps, cylinders, pump rod 3, 4, 6 in., irrigating pipe rebuilt, new, for less. Demmitt, 120 N. Main St., L. A.

**For Sale**—New DeLaval Separator No. 15 with belt power attachment, used only three months. H. H. Sisson, Willits, California.

**Merry Garden Tractor For Sale**—Used but little. Plenty of tools. Price reasonable. Address Salisbury, Route 11, box 142 Los Angeles.

## POLAND CHINAS

**POLAND-CHINAS STRALOCH FARM**
**Two and one-half miles west of Davis, Calif. on Highway, C. Harold Hopkins, Woodland, California.**

## HOGS

**Tamworths, The Bacon Breed...** James J. Summerfield, Santa Rosa.

## SHEEP

**For Sale**—650 ewes, in lots to suit. Very large. Will shear 9 pounds wool. No old sheep. Price $8.50. Also 28 splendid rams at $10 to $20. Several Dorset and Shropshire rams. Sampson B. Wright, Santa Rosa, Calif.

**For Sale**—500 EWES bred for early lambing to Shropshire bucks. Delivery any time. Price, $9.00 per head. No broken months. Address Route A, Box 227, Redlands, California. Phone Suburban 9152.

**HAMPSHIRE DOWNS**
**STRALOCH FARM**
**Two and one-half miles west of Davis, Calif. on Highway, C. Harold Hopkins, Woodland, California.**

## SEEDS AND PLANTS

**Carolina Strawberry Plants for Fall Planting**—the most prolific and best berry. Gives crop the first year. Postpaid $1.50 per hundred. Write for prices on larger quantities. G. M. Hawley, El Cajon, Rd. No. 2.

**D. Lotus Seed**—Manchurian stock for Japanese persimmons. Let me include your needs in my 1923 importation from Manchuria. Fred W. Kelsey, Nurseryman & Orchardist, El Monte, California.

## CATTLE

**Jersey Show Bull Calf For Sale.** Born November 29, 1921. Sire traces 6 times to Financial Count in 5 generations. Dam Register of Merit cow with 489 pounds butter on two milkings a day. Strong in Noble of Oakland and Financial blood. A splendid individual and priced to sell. Grant A. Brown, El Monte, Calif.

**Holsteins—For Sale**—Jane Garden Nero Abbekirk, a son of Sir Aggie de Kol Acme out of a 34 pound cow. Also two of his sons, and several high class females, registered and grade. Derryfield Farm, Capital National Bank Bldg., Sacramento.

**Guernseys — Grape Wild Farms — Berkshires**—Young bulls, from calf age up to 16 months old, of May Rose breeding and out of A. R. cows. Bred sows and gilts, service boars and pigs of both sexes for sale. Grape Wild Farms, Escalon, California. A. B. Humphrey, Proprietor.

**Registered Guernsey Bull Calves for Sale** from A. R. Dams and Sires. This herd passed the State Tuberculin test on July 10th, 1922, making one of the longest continuous T. B. free records of any Guernsey Herd on the Coast. James A. Brown, Capitola, California.

**Shorthorns** bred for range purposes and of Pure Scotch Blood Lines. Show herd won highest honors in 1917. Visitors welcome; information cheerfully given. T. T. Miller, Hollister, California.

**SHORTHORNS STRALOCH FARM**
Two and one-half miles west of Davis, Calif., on Highway. C. Harold Hopkins, Woodland, Calif.

**Yearly Record Holsteins**—Bulls from 500 to 1000 pound dams and by World Record sires. A. W. Morris & Sons, Woodland, California.

**Registered Holstein Bull** sired by King Pontiac Segis 3rd. Will sell cheap or trade for good cow. J. P. Kelly, San Bernardino.

**Aberdeen-Angus Cattle**—Registered bulls; heifers always on hand. Everything priced to please buyer. rook Hollow Farm, Hollister, California.

**Breeders of Registered Shorthorns**—Milk strain; choice young stock for sale. John Lynch Ranch, Box 321, Petaluma.

**Registered Holstein Bulls** of various ages for sale. Millbrae Dairy, Millbrae, California.

**Herefords—"Veramont Stock Farm,"** H. M. Barngrover, Prop., Stockton, California.

**Winsor Ranch Jerseys**—Bull calves with production behind them, at reasonable prices. BONITA, CALIFORNIA.

**Registered Herefords—Anxiety IV strain.** Breeding stock for sale. Chas. Rule, Duncans Mills, California.

## WANTED

**Competent Dairyman and Farmer**—35 years, married, no children, wants to take charge of place or work as first helper. Knowledge of thoroughbred stock and testing records, best references. Send particulars to L. Morel, P. O. Box 705, Modesto, Calif.

**Wanted: Men With Spare Time to represent established California compan selling standard material to ranchers in ten southern counties. Good pay. Address W. S. H., care California Cultivator, Los Angeles.**

**Wanted Throughout California, men with autos to represent established farm publication selling and collecting subscriptions. Flat salary. Write or call. J. H. Yetter, 317 Central Ave. Los Angeles.**

**Wanted to Buy** dried apricots and peaches. Please mail samples to W. A. Collins, Box 397, packing house at Santa Fe Depot, Santa Ana, California.

**We Are in the Market** for several thousand first class citrus trees on sour roots. Dortons Southwest Nurseries, Harlingen, Texas.

**Wanted**—Rooted grapes and cuttings for delivery in season. Quote prices per thousand to Mission Oak Nursery, Santa Barbara, California.

**I Want Farms for cash buyers. Will deal with owners only. R. A. McNown, 370 Wilkinson Bldg., Omaha, Nebr**

## MISCELLANEOUS

**Natural Leaf Tobacco.** Chewing 5 pounds $1.75; 10 pounds, $3.00. Smoking, 5 pounds, $1.25; 10 pounds, $2.00. Send no money. Pay when received. Tobacco Growers Union, Paducah, Ky.

**Smoked Salmon**—5 pound box, $1.25; salt salmon bellies, 5 pounds $1.25, delivered by mail. Coffin Fish Co., Seattle, Washington.

**Hemstitching and Picoting Attachment; fits all sewing machines. Price $2.00.** Checks 10c extra. Light's Mail Order House, Box 127, Birmingham, Ala.

**Kentucky Homespun Smoking Tobacco.** Ages in bulk. Mellow and sweet. 10 lbs., $1.50; 20 lbs., $2.75. Tobacco Growers Union, Lynnville, Kentucky.

**Leaf Tobacco**—good for smoking or to use in hen nests. Fifteen cents pound—express paid on 10 pounds or more. Grant, P. O. Box 466, Fresno, California.

## PATENT ATTORNEYS

**WEBSTER, WEBSTER & BLEWETT, Savings and Loan Bldg., Stockton, California. Established 50 years. Send for free book on patents.**

## CORN HARVESTER

**Corn Harvester** cuts and piles on harvester or winrows. Man and horse cuts and shocks equal Corn Binder. Sold in every state. Only $25 with fodder tieing attachment. Testimonials and catalog FREE showing picture of Harvester. Process Harvester Co., Salina, Kansas.

## DUROC-JERSEYS

**Mayflower Duroc Jersey Reds** are good ones—30 gilts, 20 boars, 8 bred sows. Priced to sell. Sired by four of the best boars in California. Their fair record stands behind them. Royal I Am, Craigs Pathfinder, Orion Cherry King J. K. and Defender W S K. Nothing but the very best sold and guaranteed to please. Kincaid & Muselman, E. Bakersfield, California.

**For Sale—500 Lb. Pure Bred Duroc Jersey** registered sow with 4 gilts from Diamond Sensation, $100. 6 sows and 3 boars in above litter. Kepler Lutschg, Fullerton, Calif.

**Weanling Boars and Gilts by Pathfinder Wonder** (Great Wonder I am ex an 800 lb. Pathfinder sow) for $10 each. Bred sows and gilts. Derryfield Farm, Capital National Bank Bldg., Sacramento, California

**Greenwood Farm Durocs**—An especially good lot of spring boars. Witherow & Stafford, Live Oak, California.

**Winsor Ranch Durocs**—The best of stock at reasonable prices. BONITA, CALIFORNIA.

Best roofing and preservative paint under sun sold direct to you by the manufacturer for only 15c a gallon. Write for free sample of Asphaltoid. Barn paint 45c gallon. Stains and paints 55c and 85c a gallon. Woolner Oil Co., 4th and Commonwealth, Los Angeles, Calif.

## TREES

**For Sale—Grafted walnut trees, also citrus and deciduous trees. Order now for 1922 delivery. Get my prices. Ketscher's Nursery, 1101 E. 4th Street, Santa Ana, California. Phone 572-W.**

**For Sale—Grafted Walnut Trees for season of 1923.** Placentia, Eureka, Chase and Payne. Early buyers get the best. C. W. Story Nurseries, Rivera, California.

**For Sale**—"Victory" Avocado Buds at $10.00 per hundred. Come by appointment or bring budder. A. B. Phelps, Horn Avenue, Sherman, Calif.

**For Sale**—Hachiya Persimmon Trees, grafted on lotus root. Get my prices. Geo. M. Ketscher, 1101 E. 4th Street, Santa Ana, California. Phone 572-W.

**1000 to 1500 Avocado Seedlings** for lining out. Address Wagner's Nursery, Pasadena.

**1000 Avocado Seedlings.** L. A. Tuttle Nurseries, Route 1, Pasadena.

**Beeman Tractor Cheap — Young man learn trade. Cash Nursery, Sebastopol.**

## HORTICULTURAL PRINTING

**Catalogues and Booklets, office forms and correspondence stationery for the nursery, seed and florist trade; half-tone cuts of many standard plants. Correspondence invited. The Kruckeberg Press, 236 Court St., Los Angeles.**

has a splendid exhibit of quail, partridge and other game birds. The turkey section contains some exceptional birds of prime quality and great size.

### Livestock

The entire north section of the big grounds is devoted to the display of livestock. Notwithstanding the fact that there are many hundreds of pens to contain the livestock that is sent in, this department is always taxed to the limit of its capacity to accommodate the prize animals which find their way to the state fair. This department, embracing beef cattle, sheep, hogs and milk goats, gives one an opportunity to spend at least a day viewing the splendid specimens of livestock that California has been able to produce.

### Playgrounds and Lunch Rooms

A children's playground is equipped with all the paraphernalia commonly enjoyed by the children and this has always been the scene of intense juvenile activities.

There are plenty of lunch rooms on the grounds, plenty of novelties to buy, plenty of parking space for automobiles, and plenty of amusement for everybody.

### Rooms for Everybody

The chamber of commerce of Sacramento has listed available rooms, and while accommodations cannot always be secured at the hotels, ample sleeping accommodations may be had in hundreds of private homes throughout all sections of the city.

California's fair for 1922 will probably be the greatest exposition of agricultural achievements ever held, and those who are fortunate enough to have the opportunity of visiting this great exposition will truly not be disappointed, judging from reports of entries and special features to be enjoyed.

---

Says Sam: By and large, I'd rather have hayseed in my hair than soot.

# Walnut Curing

By C. V. Newman, San Joaquin Fruit Company, before Walnut Growers' Institute.

PRODUCING, picking, curing, packing and marketing are the five big operations in the walnut business, and the ultimate success of the industry depends upon the proper coordination of them all.

Under normal conditions when the kernel of the walnut is fully developed and contains the maximum of oil the husk breaks open and we say the walnut is ripe. Now a ripe walnut contains a certain amount of moisture and the careful removal of this moisture constitutes the curing of the walnut, the subject of this discussion. There are four methods of curing walnuts, sun curing in trays, bin curing with heat, house curing with movable trays, and house curing with movable trays and forced currents of hot and cold air.

Fully 95 per cent of California's walnuts are cured in the sun in trays. Walnuts are spread out, stirred daily and, depending on weather and the condition in which they come from the field, are cured ready for processing with four to twelve days. During moderate sunny weather walnuts are cured in trays quickly and with little loss from shrinkage, cracking or mold. During foggy or rainy weather the trays can be covered or stacked, but the process of curing is delayed, the drying yard becomes congested, and the walnuts may mold. One of the greatest losses to the industry as a whole from this method of curing comes from the fact that during bad weather deliveries to the packing plant are cut off, shipments East are delayed, packing houses run on half time, and this means a general rush and probable loss at the end of the season.

A few attempts have been made, even as much as 20 years ago, to cure walnuts in bins by use of heated air. The number cured in this manner however is insignificant, probably because of the difficulty in obtaining uniform cure. Frequent turning of walnuts seems to be necessary if one is to cure them thoroughly in the shortest time with the minimum of loss from over drying or mold.

The third method of curing is that which is carried on within a covered drying shed. Many clever ideas have been worked out by different men to cure their walnuts in houses, and still less than 5 per cent of the crop is handled in this way. The hope of every designer of a house is to lower the cost of operation, to economize drying space, to save shrinkage, and to avoid the extremes of weather so detrimental to proper curing. Most houses are equipped with conveying belts or elevators so that the walnuts can be moved from the receiving platform to the drying trays and then back when cured to the sacking bin. Trays are so arranged that they can be turned daily, and thus in favorable weather walnuts can be cured within about four to eight days with a shrinkage of about six to seven per cent.

One of the best curing houses on the market today is the Sidwell dryer with which most of the growers are familiar. In this dryer the walnuts can be easily turned and well cured, and while the first cost is rather high the operation is economical. All's well in fair weather with this house, as it is with other enclosed dryers, but when the walnuts come in after a rain—and that's when they do come in—and the clouds and fog hang around for a week, and the house is full of wet nuts, then the grower says to his neighbor, "We would be all right yet if we could just get some sunshine or a little east wind within another day or so." It would therefore seem that, if during rainy weather a grower could mechanically produce just the right amount of east wind at the right time, he would make a hit, and this brings us to the fourth method of curing walnuts.

This system of curing is the same as the one already described except that there is added the use of hot or cold air currents. The Limoneira Company built a Sidwell curing plant in 1919 and in 1921 installed two large bins with a capacity of about 1500 cubic feet or, roughly, 15 tons. They connected with these bins a seven-inch blower with a 10-horsepower motor, speed 1700 r. p. m., and having a capacity for displacing 3000 cubic feet of air per minute. The object of the bins is to give added capacity to the plant and with the use of the air currents to give the walnuts a preliminary drying before putting them in the trays. Although the results have not been entirely satisfactory the bins and air currents have made it possible to shorten the curing process in bad weather. There is no doubt that this plant could be made more efficient if another blower were installed which would direct a strong current of air right through the trays.

The San Joaquin Fruit Company built a dryer in 1919, in which the walnuts were stirred and cured by allowing them to move down a short distance each day by gravity on sloping trays. With this method it is very difficult to keep green and dry walnuts separate, and on the whole the process is slow and unsatisfactory. A heavy crop of walnuts was harvested and cured fairly well the first season, but most of the success was due to good curing weather which prevailed in the fall of 1919. Bad weather would have caused much damage.

In the summer of 1920 this company installed a small crude oil burner and a blower to force the heated air to the drying shed. A bin was built which would hold 10 tons of walnuts, or a day's pick, and during bad weather the walnuts were put in this bin and hot air at about 85 to 90 degrees forced in at the bottom for about 18 hours, when the bin was emptied and the process repeated with green nuts. In this manner the outside moisture was driven off and the curing process in the trays was made shorter.

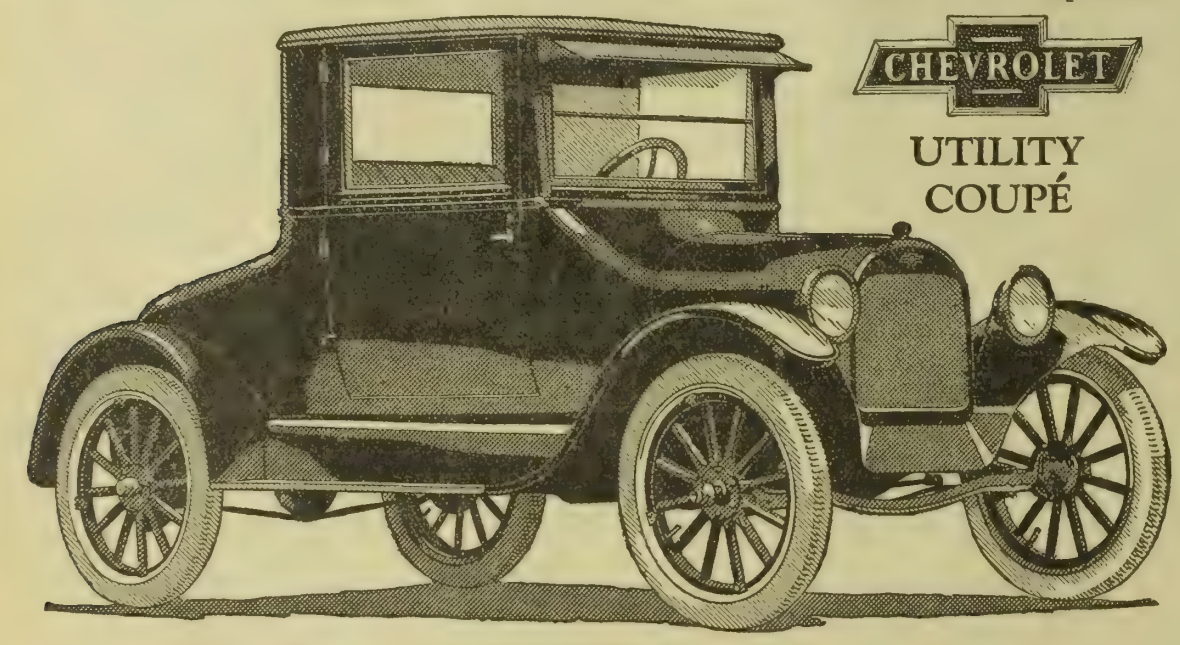
With these improvements the house capacity still was not sufficient under adverse weather conditions. So in 1921 in cooperation with Fern Bishop of Santa Ana the San Joaquin Fruit Company remodeled the old bin, put in another one and added to the equipment a big exhauster fan, which was connected with the hot air furnace and with distributing pipes in the bins. In addition to the furnace and blower for the bins a series of 24-30 inch fans were put back within the house so that a current of air could be forced over the trays when desired. This equipment was put in for emergency weather but was used a part of the time during the whole season. And now while the house is not a perfect curing plant still conditions have been much improved. The greatest drawback is the gravity trays, which make it difficult to stir the walnuts properly.

In discussing the subject with well informed men in this business it appears that everyone is agreed that the ideal way to cure walnuts is to dry them in a house; have the house so that it can be closed if desired to keep out either east wind or fog, the house to be so arranged that the walnuts can be continuously or frequently stirred and with a furnace and fans

For Economical Transportation

CHEVROLET

UTILITY COUPÉ



The Lowest Priced
High Grade Closed Car

$680
f. o. b. Flint, Michigan

This is the car for the country.

No new model Chevrolet has ever met with such quick success with farmers. It is just what they have long wanted—a high-grade closed car at a surprisingly low price.

Like every other Chevrolet model it offers unmatchable VALUE.

The high-grade Fisher Body is practical as well as handsome. The extra large, heavy plate-glass windows afford clear vision on all four sides.

The mammoth rear compartment with locking cover contains 14 cu. ft. of space for luggage, packages, produce and merchandise of all kinds.

The upholstery is in gray whipcord—wide, comfortable, well-sprung seat and back—easily kept clean. Equipment includes standard three speed transmission, vacuum feed, cord tires.

The chassis is the Superior Chevrolet with that celebrated valve-in-head motor, which has been an important factor in giving us first place in sales of standard equipped automobiles.

No matter what car you own or think of buying, you owe it to yourself to see this all-weather Utility Coupé and COMPARE IT for value and low mileage costs.

Farmers know car value. That is why they are buying this model by the thousands.

to be able to have full control of drying conditions in all kinds of weather. In principle I believe such a house is logical; however, it remains to work out the details in practice on an economical and efficient basis.

Mr. Bishop has a plan for curing house that combines many important features for the control of temperature and humidity and includes a simple device for continuously stirring the walnuts. Briefly this plan consists of a series of revolving cylinders constructed of hardware cloth and made to hold approximately 500 pounds each. The cylinders, or "squirrel cages" as he calls it, would be arranged in batteries of eight to ten in an enclosed room. Heated air can be forced in at the bottom of these rooms, and as the cylinders slowly turn, walnuts can be cured uniformly in the minimum of time. In fact, Mr. Bishop declares that he has taken green walnuts and cured them in these cylinders in 19 hours at a temperature of 84 degrees and that the same walnuts 60 days later do not show any signs of becoming rancid or moldy. Walnuts handled in the above way will probably stand a temperature of from 85 to 90 degrees for 25 hours or 95 to 100 degrees for six to 12 hours without cracking the shell or starting the oil. An east wind or a hot sun will crack a walnut in six hours if exposed and not turned. The same walnut will stand higher heat a longer time if continuously stirred, and will therefore cure faster and better. It looks then as though this system of curing has the good features of sunshine and east wind without the bad effects.

The advantages of a house in which drying conditions can be mechanically controlled are these: First, the more rapidly a walnut can be cured the less space required to handle a crop; second, rapid curing prevents mold; third, it means a constant supply of cured walnuts to the packing house, which insures steady shipments and early successful returns to the grower.

I believe the subject is worthy of considerable study and support on the part of the field department of the Walnut Growers Association. I believe that the efforts of individual companies and growers should be investigated and encouraged, and further, that at least one curing plant be installed at some association house at the expense of the Walnut Growers Association, to be operated one year experimentally under close supervision; at the end of one year, if successful, to be taken over by this local association; if a failure, to be charged to the growers at large. The question has come up many times, should associations build houses and cure as well as process all walnuts? The plan has many advantages, but I believe that the time to make such a move is after some process has been perfected and accepted by the Walnut Growers Association.

In conclusion I will say that in the preparation of their product for market the walnut growers' methods are crude. In comparison with the progress made in the dehydration of vegetables and fruits, and in comparison with the changes made in the care of citrus fruit, the walnut grower has done very little. The importance of the walnut industry is based on the actual food value of the product. For this reason the industry was begun on a firm economical foundation and its success is worthy of the best efforts of any man. Under the able management of the association walnut growing is becoming one of the most certain of farming operations, and even during this last year of business depression a crop of 18,000 tons was sold at a price above that of any like commodity. To maintain this standard it's up to the grower to deliver quality goods. The surest way to do this is for the farmer to grow the best walnut he knows how and then in cooperation with the field department to study and put into practice the best known method for the rapid curing of walnuts under all weather conditions.

---

According to a report of the Sun Maid Raisin Growers, 40,310 acres have been planted to grapes in California since the first of this year. There is now a grand total of 400,443 acres of vineyards in this state. Fresno County has more than half the total state acreage, or 215,715 acres.

These are actual prices obtained August 29 by Los Angeles wholesalers from their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc, as compiled by the U. S. Bureau of Markets. Terms, cash on the walk.

Apples: Demand and movement moderate, market steady. Northerns: Gravensteins, loose, 3 cents packed, fancy, 1.50@1.75; B grade, 1.15@1.25 per box. Crabapples, Locals, 85@1.00 per lug. Northern, 4½ per lb.

Cantaloupes: Market weak. Locals: Tip Tops, best, 50@65; poorer low as 25 crate.

Grapes: Demand slow, market steady. Northern: Thompson Seedless, per lb., 3@3½; Malagas, 5; Muscats, 4; Tokay, 7@8; Black Hamburg, 6@7; Rose of Peru, 5.

Nectarines: Northern, 5@6.

Peaches: Market steady. Locals and Northern, freestone and cling, all varieties, 1@3 per lb.; mostly, 2.

Pears: Demand moderate, market steady. Northern: Bartletts, mostly 3½@4½.

Plums: Demand and movement slow, market steady. Per lb.: Satsumas, 2½. Other varieties, 1@3 per lb. according to quality. Northerns: Various varieties 3@4 lb.

Watermelons: Local Klondike, best, 1.00@1.25 cwt.

### HAY

Following are prices in the general market to growers f. o. b. Los Angeles in carload lots; handling and commission must be added to obtain retail prices on new hay:

| | |
|---|---|
| Tame Oats | 18.00@20.00 |
| Barley | 15.00@17.00 |

Prices quoted f. o. b. L. A. to producers are:

| | |
|---|---|
| Rabbit Alfalfa | 18.00@20.00 |
| No. 1 Alfalfa | 15.00@17.00 |
| Standard Alfalfa | 11.00@13.00 |

Some growers report prices on ranch:

| | |
|---|---|
| Rabbit Alfalfa | 18.00@20.00 |
| No. 1 Dairy | 14.00@15.00 |
| No. 1 Alfalfa | 12.00 |
| Wheat Straw | 6.00@8.00 |
| Barley Straw | 4.00@6.00 |

### GRAIN

Prices L. A. Grain Exchange, August 22:

Barley: 100 ton lots September Del., 1.25@1.37½.

California Farm Bureau Exchange grain department, Los Angeles, August 28:

Barley. Less barley has been exported this season than for any season during the past ten years. Values have held remarkably well for a purely domestic consumption. While the price received by the farmer is very low, it is much better than would have been obtained had the farmers not organized the exchange. The Imperial Valley has been and is receiving top premiums for its barley, to which it is entitled on account of its peculiar location. The Imperial County farmers are a unit in endorsing the good work the exchange has done this year for them.

Owing to the fact that most exchange farmers have been holding back their shipments from San Joaquin and Salinas Valleys, the supply coming to Los Angeles has not exceeded the demand and prices here have been from 5 to 10 cents over San Francisco. This is due to the fact that the big bulk of the barley crop in California is in the northern counties this year and Southern California has not produced enough for its own consumption. Unless an export demand asserts itself soon, however, supplies that are still in the field in the northern counties must be moved, and it is quite likely that a temporary excess of shipments may occur at any time and reduce prices accordingly. We are, however, of the opinion that the Los Angeles market will maintain a premium over the San Francisco market for the reasons named above, and for the further reason that the exchange is better represented in counties tributary to Los Angeles.

Present values in Los Angeles are from $1.27½ to $1.32½ for good barley. This is a very bad market for smutty or off grade barley as it is discounted more heavily than in San Francisco. Such barley should, wherever possible, be used for local consumption or ship to nearby points as the freight is just as much on smutty or trashy barley as on good barley and the price to the farmer is correspondingly lower the further it is shipped.

Oats. These are in an uncertain position. Feed oats are in particularly light demand as white Utah. Idaho oats will soon be available and eastern white oats are availble at from $1.55 to $1.60 for feed. Texas red oats for seed can be had at around $2.00 to $2.10 sacked, delivered California points.

## San Francisco Markets

San Francisco, August 29, 1922.

### BUTTER

Sales on Dairy Exchange:

Following quotations carry a jobber-to-jobber discount of 10 per cent, plus a seller's handling charge of 2 per cent of net invoice:

| Cranberries | 5.75 |
| Bayos | 5.00 |
| Blackeyes | 4.00 |
| Henderson Bush Limas | 8.00 |

### HAY AND FEEDSTUFF

A. W. Scott Co. says under date of August 26:

The San Francisco hay market has shown but little life during the week and closes dull and weak. Receipts have exceeded the demand and concessions have been made to keep the surplus moving. General demand has little life and buyers have been picking and choosing about as they liked and with all conditions in their favor.

Export and coast shipments have held steady but with all orders lighter and volume much reduced; scarcity of freight space is partly the cause. Government and overseas shipment has discontinued for the moment which has somewhat slowed down export activity. Interior trading has been quiet but moving in fair quantities and with little price change. A few fair sized crops have been sold but at generally weaker figures than have been maintained. Alfalfa closes a little stronger in price. Producers have cashed their cuttings and feel more independent in holding for better figures.

| | Ton |
|---|---|
| Wheat Hay, No. 1 | 15.00@17.00 |
| Wheat Hay, Fair Grade | 13.00@15.00 |

Oats: 1.60@1.75.
Corn: White Egyptian, nominal; colored milo, 1.80@1.95; No. 2 bulk, 1.80@1.99; No. 2 Eastern yellow, 1.51@1.57.

### SNAPPY NOTES

Mr. Spellmeyer's notes on the livestock market may be found on page 235.

## Citrus Markets

Los Angeles, August 30, 1922.

There are nearly 3,000 cars of Valencias yet to go and prices are holding up in excellent shape, ranging around $8.00 or $9.00 f. o. b.

Next season's output will be greater than anticipated. Shipments will probably not begin in northern sections until November, but Valencias will carry until that time. Output of oranges and grapefruit will be about 40,000 cars; lemons, 11,000 cars. Fruits will run to large sizes.

Hot weather has aided in cleaning up on lemons. Market strong with quotations above $6.00 on fancy stock.

**Citrus Shipments**

Shipments of citrus fruits to date since November 1, 1921. Southern California: Oranges, 21,298 cars; lemons, 8,944; total, 30,242. To same date last season: Oranges, 35,870; lemons, 10,047; total 45,917. From Central California to date this season: Oranges, 5,099; lemons, 106; total, 5,205. To same date last season: Oranges, 6,603 cars; lemons, 185; total, 6,788. From Northern California to date this season: Oranges, 372; lemons, 8; total 380. To same date last season; Oranges, 305; lemons, 5; total 310.

# A New ESSEX

## A Roomier Open Car—A Greater Chassis

You can have no appreciation of what this price buys until you examine and drive it.

To all that made Essex such a wonderful value in the past are added refinements and comforts never before offered in a car of its price class. Roomier seating, wider doors and greater riding ease, contribute something new in personal comfort.

smoothness is even more pronounced. You will instantly note its greater beauty. Its care and attention are easier, cleaner, more convenient.

It will reveal a charm you never suspected in any except the large costly cars.

### The Result of Three Years' Experience

Back of the new Essex is all we learned in building 70,000 earlier Essex cars. Finer precision standards have resulted and Essex

Wider Seats
Wider Doors
Lubricated with an oil can—no messy grease cups.
Thief-proof Lock, reduces insurance cost 15% to 20%.

### It Improves in Service

Old owners tell you of a car so enduringly designed and built that its performance improves for thousands of miles.

But today's Essex combines advantages no earlier owner knows. Go see, and ride in it. It is the best Essex ever built, and at the lowest price.

# New Type of Grain Binder

This year's harvest has witnessed the satisfactory testing of a new type of grain binder. The ordinary binder gets its power from the main wheel and therefore can be used with horses or any other power. This new binder is for operation by tractor only because the binder receives all the power to operate its mechanism from the tractor.

There is no question that future development in farm machine design will be largely along the lines of developing machines which will receive their power through a power take-off attachment on the tractor rather than through traction or driving wheels of the machine itself. Frank McKiske, of Illinois, has used one in the present harvest with remarkable success. His 17 year old son, with the new power driven binder and 8-16 tractor had no trouble in harvesting 30 to 35 acres a day, operating both the tractor and the binder, as all the binder control levers were easily within his reach from the binder seat.

The power driven binder is a combination of the perfected grain binder and the modern farm tractor. The tractor pulls the binder as is the common practice, but instead of the binder mechanism being run by the binder main wheel, it is driven by a revolving shaft from the tractor. The power that cuts, harvests, and binds the grain comes steadily from the tractor engine regardless of the condition of the ground. This arrangement enables the binder to be run at a more uniform rate of speed. This direct positive drive prevents slippage and choking where conditions are bad. It cuts the grain clean. The steady flow of power from the tractor to the binder makes it possible to cut a wider swath than with the ordinary binder. It also enables the grain to be cut in wet spots and to handle down and lodged grain with more certainty.

Next year will witness a much more general use of this type of binder by wheat growers. Practically doubling the capacity of one man at harvest time is no small accomplishment. Fifteen to 20 acres is what the horse driven binder ordinarily harvests in a day, while the new power driven binder easily handles 30 to 35. Those who have felt that the grain binder was standardized and not subject to improvement have a surpise in store for them when they see the new power driven binder at work.

Will Reap and Bind 35 Acres Daily.

Agricultural implement makers meet the needs of the day. This binder, operated by tractor, has been handled by a woman operator and by school boy and 35 acres handled daily.

# The Eelworm and Potatoes

By W. V. Shear, California Department of Agriculture

THE tender tissues of the potato make an ideal environment for the eelworm. The worms occupy the outer layer of the potato to a depth of about one-quarter of an inch. When the worms are present in large numbers in the tuber, the surface of the potato is covered more or less with small elevations or pimples. Usually the skin of the potato covering these pimples is not broken. When one has had considerable experience in handling such potatoes, the presence of the infestation can almost certainly be determined by simply running the fingers over the surface of the tuber. However, a few of the parasites may be present in tubers without any outward manifestation.

Each tiny spot in cross section of an infested potato represents a small brownish cyst inside of which the parasite may be found. If the cyst happens to contain a female nematode, several hundred eggs may also be contained within it. The whole tuber often contains a great many thousands of these worms. When they are present in large numbers the tuber shrivels prematurely and decays more quickly than uninfested stock. Evidently such infested potatoes can hardly be called edible although they are sold in our markets in considerable quantities. Since in small tubers the worms penetrate almost to the center of the potatoes, the potatoes are practically a total loss as the portion of the tubers containing these worms is usually pared away before cooking. In large potatoes, the loss is often as great as 50 per cent.

Considered then merely as an economic problem for the grower and consumer, the grower loses because of a considerably decreased yield and because he must accept a much lower price for these wormy potatoes than he would receive for clean stock. The consumers lose through waste in paring, if they understand the nature of the disease and do not care to eat potatoes and worms at the same time. Many of these potatoes are said to be sold to the cheaper classes of hotels and restaurants where they may be used as mashed potatoes and the identity of the tiny inhabitants of the tubers becomes lost in the mixture.

The most serious phase of the problem, however, arises through the distribution of these diseased potatoes. In this respect California is in a rather peculiar situation. Throughout most of the state the farmers do not grow enough potatoes for their own use. They usually have a small patch, the product of which lasts but a short time. Even if they grow them in large quantity for market purposes, the lack of proper storage facilities prevents their holding over a sufficient stock for home use throughout the year. Therefore, during a considerable portion of the year, they purchase their potatoes in the open market. Evidently, then, if a large potato producing section of the state or adjoining states ships potatoes infested with eelworms throughout the state, there is great danger of valuable farming lands becoming infested through the unrestricted distribution of potatoes carrying this pest. The housewife when preparing these potatoes for the table pares them and throws the refuse out to the stock or on the manure pile in the corral and from there they are spread over the fields. If any of the potatoes used on the ranches therefore are infested with eelworms, a portion of the worms at least are very liable to be spread over the ranches of the state. When we consider how serious this pest is on many of our agricultural crops such as tomatoes, cantaloupes, lettuce, beans, peas, etc., when the soil once becomes infested, the injury which may arise through the shipment of infested potatoes can be somewhat appreciated. There has come to the writer's knowledge an instance where a farmer discovered eelworms in the potatoes he grew on his ranch and investigation showed pretty conclusively that the only way the infestation could have been brought about was through the fact that he had been getting potato

WESTERN CANADA for Stock Raising

Vast stretches of undeveloped fertile agricultural land of the highest productiveness await the settler in Western Canada. The land possesses the same character of soil as that which has produced the high quality of cereals that have carried off the world's premier honors so many times. **Native grasses are Rich and Abundant.** Cattle fattens on them without any grain being fed.

The place for the man with limited capital to overcome difficulties of high priced land or the burden of heavy rents is in Western Canada—where *land is cheap*, where a home may be made at low cost, and where *dairying, mixed farming and stock raising are particularly profitable.*

**Homestead of 160 acres** in the more remote districts **FREE to settlers.**

For illustrated literature, maps, description of farm opportunities in Manitoba, Saskatchewan, Alberta and British Columbia, reduced railway rates, etc., write to

parings and other garbage from a hotel in a nearby town for his cows. In this way he unwittingly stocked his land with a serious pest.

Not only is there danger of clean land becoming infested through potato parings, but ranchers often use so-called table potatoes for seed purposes and in this way the eelworm is actually planted in the ground.

The eelworm is not yet generally distributed over the State of California. Probably it is not found at all in many counties or only in very restricted areas. It is highly important then, that potatoes affected with this disease be rigidly prevented from distribution. The easiest way to prevent their distribution is to prevent the production of potatoes infested with these worms. This means planting only disease free seed on disease free land.

## EXHIBITS AT VENTURA

The Ventura County Fair will be held at Seaside Park, Ventura, October 4-8 inclusive. There will be a great array of orchard and farm products. Expectation is running high among the growers of California, as Ventura has broadcasted the announcement that especial attention is to be given to the exhibition of orchard and farm products and that the premiums offered for prize displays will be greater than ever before.

Citrus fruits and other orchard products will share honors with a wealth of farm displays, and competition among the exhibitors will undoubtedly be keener than ever before in the history of Ventura fairs.

Other features of the "million dollar exposition," as the 1922 Ventura County Fair is termed, will be the harness and running races, cat, dog and horse shows, daily band concerts, the women's department with its own concerts and program and a score of other attractions. Then there will be an automobile exhibit, polo matches, and a livestock exhibit. Additional pens and box stalls are now being constructed at Seaside Park to house the overflow entries.

In anticipation of record breaking crowds at this year's exposition the Ventura fair officials are expending ten thousand dollars upon the construction of added seating capacity both in the grandstand section and in the bleachers.—V.

## LOS ANGELES COUNTY FAIR

A high standard of excellence will be set by the Los Angeles county fair at Pomona, October 17-21. The plans now being carried out in the construction of the grounds in a 40 acre tract adjoining Ganesha Park provide for permanent quarters.

The exhibits will cover a wide scope in every department and will be housed by a group of eight buildings and an array of big tents. The main tent, 130 by 530 feet, will contain the agricultural, manufacturers', and auto show. Interesting demonstrations will take place daily. In preparation for the races, directed by W. S. Newton of the Pomona chamber of commerce, a grandstand and a half mile track are being constructed, and 400 foot stables will be put up for the horses. An elaborate horse show will be held the last four nights of the fair and managed by Tom Managan. Extremely generous lists of cash prizes are offered for the races and horse show. It is said that a novel contrast will be afforded in an auto race in which only cars dating from 1910 or earlier may be entered.

A big showing will be made in blooded livestock, and assurances have been received of full lists of horses, beef and dairy cattle, swine, goats, sheep, rabbits, cavies and poultry. The California Junior Republic will exhibit a herd of Holstein cattle including many of the prize winners entered at the state fair. Last year this herd won 14 out of 16 possible prizes against 114 animals entered by 22 different exhibitors. Jerseys from Harry Cook's ranch at Chino and Guernsey cattle and Berkshire swine owned by the Italian Vineyard Company will also be shown. The complete herd of Duroc-Jerseys will be sent from the Charnock Ranch at Hemet. The Citrus Milk Goat Association, represented by L. C. Buhl of Upland and Mrs. W. S. True of La Verne, has announced an exhibit of 250 goats in prospect.—G.

"OILINESS"~what it means to trucks & tractors

"'Oiliness' is the ability of a lubricating oil to cling evenly to bearing surfaces, at the same time offering in itself a minimum of frictional resistance."
— *Board of Lubrication Engineers.*

"Oiliness" in engine oil can't be seen — but is *felt* when your tractor steps into full-rated draw-bar pull — is *heard* when your truck engine hums along with heavy loads.

Zerolene has "oiliness." It clings to bearing surfaces evenly, and at the same time splashes freely — you get *all* the power the engine is rated to deliver.

*Stability — Purity*

The ideal truck or tractor oil must penetrate easily the smallest bearing clearances at all operating temperatures — and it must have stability. Zerolene penetrates, and has the stability to resist engine heat.

The unexcelled purity of Zerolene results in a harmless deposit of carbon of a soft, flaky nature, most of which is blown out with the exhaust. Zerolene minimizes engine troubles and assures longer useful service for your equipment.

Consult the Zerolene Correct Lubrication Chart for the correct grade for your truck, tractor or automobile.

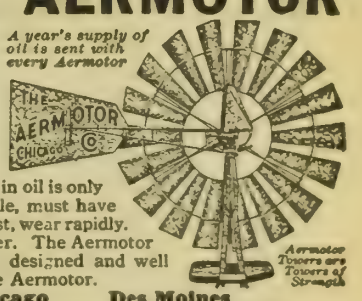
THE AUTO-OILED AERMOTOR

A Real Self-Oiling Windmill

A year's supply of oil is sent with every Aermotor



Oil an Aermotor once a year and it is always oiled. Every moving part is completely and fully oiled. A constant stream of oil flows on every bearing. The shafts run in oil. The double gears run in oil in a tightly enclosed gear case. Friction and wear are practically eliminated.

Any windmill which does not have the gears running in oil is only half oiled. A modern windmill, like a modern automobile, must have its gears enclosed and run in oil. Dry gears, exposed to dust, wear rapidly. Dry bearings and dry gears cause friction and loss of power. The Aermotor pumps in the lightest breeze because it is correctly designed and well oiled. To get everlasting windmill satisfaction, buy the Aermotor.

# Poultry Queries

(Conducted by Jean A. Koethen)

### Charcoal for Chickens

What is the purpose of charcoal in the diet of chickens? Should my four and six months old pullets have all they will eat?—Subscriber, Bardsdale.

Charcoal is supposed to sweeten the contents of the crop and assist digestion. Theoretically it may be a good thing to keep it before perfectly healthy chickens; in practice I wonder how often that is done. Chickens with grit and shell before them, plenty of grain feed and a carefully balanced ration have no more need of charcoal than a healthy child has need of dyspepsia tablets, and I have never understood why it is so generally included in the mash. When there are symptoms of indigestion it is a good thing to mix a little in the mash, but healthy chickens under normal conditions ought not to need it.

### Dropsy

One of my hens, apparently healthy and laying, has a large bag between her legs. Can it have any connection with the occasional laying of bloody eggs?—Subscriber, Turlock.

If the whole abdomen is distended the hen probably has dropsy. If the bag is outside the abdomen it is a tumor of some sort. As the hen is three years old it would be better to kill her than attempt treatment, but as long as she seems well and is laying why not leave her alone? Blood spots in eggs are the result of slight hemorrhages in the oviduct, especially in hens that are laying heavily.

### Wild Turkey Toms

What are the advantages of using wild turkey toms, and where can such toms be procured?—Subscriber, Paso Robles.

An intermixture of wild blood is believed by many breeders to increase the vigor of domestic stock, which in very many cases has been diminished by inbreeding. This is not necessarily the case, but it is so when no care has been taken to prevent the mating of related birds. On the other hand, the wild tom, while he may be more hardy, is smaller, and the offspring will be smaller than the offspring of a tom of standard size. I have not at present the name of any breeder of wild or half wild stock, but such stock has been advertised in the columns of the Cultivator occasionally and will doubtless be advertised again.

### Low Egg Prices

What is the reason for such low prices of eggs at this season? Some say it is the railroad strike; some say it is our lack of foreign trade; and some blame the Chinese eggs. I am in the chicken business and would like to know if there is any hope of better prices.—Subscriber.

I took this query to the secretary of the Poultry Producers of Southern California, who ought to know the answer if anyone does. He says prices cannot reach their former level as long as there are so many eggs in storage all over the country. In Los Angeles there are 100,000 more cases in storage than there were at this time last year. And the reason there are so many eggs in storage is that production last year, not only in California, but throughout the Middle West was at least 25 per cent greater than the production of the year before, and the production that year was almost as much in excess of that of the previous year. Middle West farmers last year because of a doubtful outlook for other crops, paid more attention to their henneries than they ever did before. The winter was mild, and all the hens kept on laying instead of stopping for a while as they do in a hard winter. Consequently the country is overstocked with eggs, and we must learn to use more of them ourselves or find a better foreign market. Probably, the Chinese eggs are somewhat to blame. A campaign of education in the great value of eggs as an article of diet is something every egg producer should boost. However, prices have been a little better the last week, and the secretary of the Poultry Producers hopes for a stronger market soon. A cold winter in the Middle West, in conjunction with the educational campaign which is under way will do a good deal to restore prices, though they will probably never again reach the level of 1919.

### Rhode Island Whites

I should like to know something about the R. I. Whites. An article I read about them two years ago gave me the impression that they were a very good breed, but I do not see them advertised in the Cultivator. I have Reds, but find their broodiness a great drawback. Please tell me also about White Wyandottes. Are they hardy and profitable?—Subscriber, Tulare.

The R. I. Whites are an excellent breed but I cannot learn that they are better in any respect than the Reds. If they were they would certanly be more popular than they are, for they have been on the market a number of years. The fact is, there is very little difference between the three American breeds, Rocks, R. I. Reds (including R. I. Whites) and Wyandottes. Weight, habits and production are all about the same. What difference there is is a difference between strains and not between breeds. They are all hardy, good mothers, good layers when they are not too broody, and excellent for the table. The more profitable strains are those which have had the tendency to broodiness partly bred out of them. You can easily breed a strain of Reds that are almost nonsitters if you will take the trouble. Begin right now to band every hen that goes broody. When she goes broody a second time band her again. Keep this up till you know how many times every hen in your flock has gone broody, say between now and the first of January. Then look over your flock and for your breeding pen take the hens that have not been banded at all if there are any; if not, then those that have gone broody but once. All your chicks next spring will then be the offspring of the hens that are least inclined to broodiness. Should you have but one hen that has not been banded, set her eggs by themselves and mark the chicks, for your breeding cockerels should be her sons. The daughters of these hens may still be quite broody, but next year's pullets, daughters of the sons of the best hens will show the effects of selection. A hen, you know, transmits both her virtues and her vices through the male line, and the only way to improve your stock is to use for sires the sons of the right kind of hen.

### Winter Greens

What is best to plant for green feed for the months of December, January and February? How and when should it be planted and how much space is needed for greens for 500 chickens?—Subscriber, Earlimart.

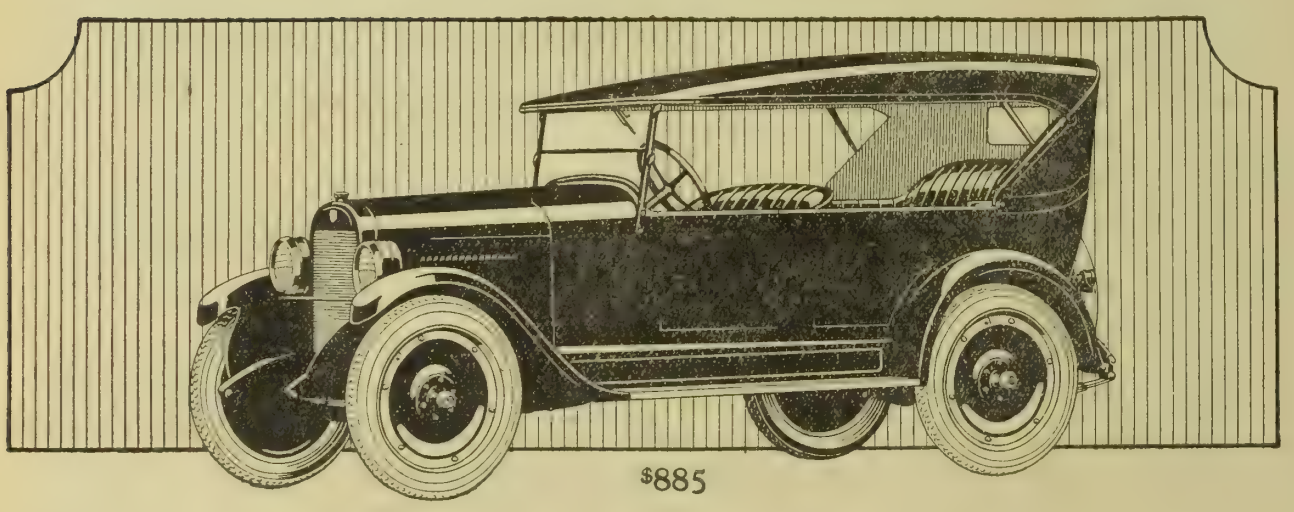
Barley is more generally used for green feed during the winter than any other kind of green, probably because it is a little less trouble. Half an acre, well watered, shoud supply 500 hens. Plant as soon as rain falls, or earlier, if you can sprinkle. Barley will grow any time if only it has water, but

### POULTRYMAN'S CALENDAR—SEPTEMBER, OUR SECOND SPRING

Californians are fortunate in that, if they fail in spring with any one of many crops, they may try again in the fall. Lettuce, chard, kale and other greens may be planted in September, also carrots and a good many vegetables. If the pullet crop is not what it should be chicks may be hatched in September, and the pullets will be ready to lay in March.

The pullets that are now maturing are the poultryman's greatest care in September. They are in the laying houses, many of them beginning to lay, and must all be in laying condition by the end of October. Keep them from laying too soon by feeding a ration rich in corn and other carbohydrates and low in animal protein. Bran and bone meal is the mash mixture recommended by Prof. Dougherty to prevent too early maturity—95 per cent bran to 5 per cent bone meal. When the pullets are 6 months of age, and before if they can no longer be held back, they should have a regular laying ration.

MAXWELL



$885

Light in weight but sturdy in build—economical of gasoline, tires, and oil—rugged and reliable in all the service of the farm.

Cord tires, non-skid front and rear; disc steel wheels, demountable at rim and at hub; drum type lamps; Alemite lubrication; motor driven electric horn; unusually long springs; deep, wide, roomy seats; real leather upholstery in open cars, broadcloth in closed cars; open car side-curtains open with doors; clutch and brake action, steering and gear shifting, remarkably easy; new type water-tight windshield.

Extra parts are always available without delay for standard advertised machinery. This class always found in the California Cultivator.

poultrymen generaly plant in October. Seed heavily on well fertilized soil, and give all possible moisture. Do not cut till it has nearly reached normal height, then cut fresh every morning and run through a clover cutter. You can give a patch three cuttings before it stops growing. Some poultry men plant their vacant runs to barley, then after it has attained its growth and has been cut three times they turn the hens in to eat up the roots. If you depend entirely on barley you will need several different patches planted at different times so that there may always be a fresh supply, but you can supplement the barley with a kale patch. Kale is a great drinker and a gross feeder, but when it is properly fed and watered a surprising amount of green can be produced on a very small piece of ground. If kale seed is planted in boxes now I think the plants will be ready for transplanting before cold weather though I have never planted except in early spring. Set them four feet apart on level ground and pile on chicken manure. Water every three or four weeks unless there is abundant rain. The more water and the more manure, the bigger will your plants grow. When they are three or four feet high you can begin taking off the lower leaves for your hens. It may be you can buy plants now. If you can it would be worth while.

### Caponizing

Please give address where caponizing tools may be purchased. Why is not caponizing more generally done on this coast? It seems to be so successful in the Middle West.—Subscriber, Corning.

Large poultry supply houses have them. The only trouble about capons on this coast is that so little caponizing is done there is no market. This, at least, is the explanation given me by a woman who had done a good deal with capons. When the public wants capons and there are none it contents itself with turkey or chicken and forgets that there is such a thing as a capon. Then when some enterprising poultryman tries to find a market for capons there is none. If a good many

See Market Pages 250 and 251

people should unite in a capon club and raise so many that the public had to take notice I suppose a good market would soon be developed, but it is hard and unprofitable to be a pioneer.

### SOUTHERN CALIFORNIA EGG LAYING CONTEST

The average production in July for all birds was 62.42 per cent, this being less than five per cent under the June production. The birds consumed on an average 3.18 pounds grain, 3.25 pounds mash and 2.21 pounds green feed.

#### Highest Pens in July

George C. England, 243¼; Bonnie Brae Farm, 234½; Bellows Egg Ranch, 231¼; Chas. Hudson & Son, 229¼; R. C. Gibson, 227¾; J. L. Miller, 226½; H. M. Stone, 226¼; W. H. Young, 224¼; J. D. Zimmerman, 223⅝; M. L. Frick, 223½.

#### Highest Birds in July

England, 30; W. A. Evans, 29; Frick, 28; Gibson, 28; M. & M. Ranch, R. I. R., 28; Bellows, 27; Flinian & Furstenfeld, 27; M. A. Schofield, 27; Mrs. Mary Eads, 27; Bonnie Brae, 27.

#### Highest Birds to Date

E. E. Eisenberg, 229; England, 223; B. S. Smallwood, 221; Schofield, 217; Frick, 215; E. E. Rogers, 214; England, 213; Geo. B. Wilken, 211; England, 211; Gibson, 209.

Poultry at Ventura County fair, October 4-8, will be judged by R. P. Krum of Stafford, Kansas, who is also to judge at Boston, Chicago, Kansas City, Cleveland and other big eastern shows.

# The rancher who needs a pump can't afford to be without a good one!

Sometimes it takes the total or partial loss of a crop to make an Irrigator realize the hazards of an insufficient water supply or the continual risk of operating a pump that "can't deliver the goods." A good pump costs more to build—but it costs less to operate and gives longer service. The Irrigators who are "cashing in" are the ones who have installed the best Pumps that money can buy. The Layne & Bowler policy has been to build the best Pumps that money can produce, to meet quality, not price competition.

### OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If among the more than 40,000 Cultivator's weekly circulation any fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

## EDITORIALETTES

The time was when human beings carried water to irrigate crops. Later they improvised great water wheels operated also by human power. Still later came the treadmill, the windmill, the steam engine, the gasoline engine, and now—simplest and the easiest managed of all—the electric motor. The satisfactory "head" one of these motors is delivering for twentieth century California irrigators is shown in the illustration on the cover. The beauty of the electric motor lies in the almost entire absence of oversight requirement. California stands at the head of all sections of the world in rural use of electric power.

* * *

The lower portion of the illustration on the cover calls equally emphatic attention to the convenience, efficiency and economy of time made possible through use of electricity in the home. Both the electric range and water heater are in action. California's hydro-electric possibilities will be developed until many a rural home will be enabled to make complete electrical installations.

* * *

What makes deciduous trees gum? If any of the readers of the California Cultivator has the answer we will be glad to pass it on to the rest of the subscribers. Mr. Nidever comes with one answer and Mr. Wood comments upon it, on pages 261 and 263, of this issue. We will be glad to hear from others who think still differently.

* * *

In the issue of the California Cultivator of August 30, 1919 we referred to the fact that a great scandal had involved to an extent, the Holstein-Friesian Association of America. We added "No business is so dependent on the integrity of the individuals engaged as the pure bred livestock industry. The very emphatic and right stand taken by the officers of the association is a forceful declaration that the business will be kept clean at all costs. Such a stand will establish confidence." The occasion for that item was the alleged falsification of records of certain Holsteins owned by a breeder in New York state. It was said that the breeder was entirely innocent and that any falsification was secured directly by an employe who had charge of the testing. The association proceeded at once to do the honorable thing and clear its records of all advanced registry certificates which had been secured through the fraud. The owner of the stock took the matter into the courts in the effort to prevent the association from canceling the certificates. The association has won in several decisions but the matter is still tied up with injunction.

### JACK KLEIN WIRES EARLY WINNINGS AT STATE FAIR

In the Holsteins Hartsook wins senior and grand champion cow and senior champion bull; Berylwood, junior and grand champion bull; R. A. Condee of George Jr. Republic, junior champion cow. In Berkshires Italian Vineyard wins junior, senior and grand champion female; Humphrey, all boar championships. Caledonia wins all Shorthorn championships. Harry H. Cook and F. R. Bain take many Jersey blues; Thorp gets champion cow; Waterloo Jersey Farm, champion cow.

## AT THE FAIR

Members of the Cultivator staff are at Sacramento this week getting together facts for making report to our readers. This report, with photographs, will give an idea of the fruits cereals and general farm products, the livestock industry, farm equipment, manufactures, and the fair in general. California is first in production per farm and well up to the front of all the states of the Union in total agricultural production. It is well that our state fair should be the great success which it has been. Regarding it George C. Roeding, former president, writes:

"Nothing gives stronger evidence of progress in California's rural industries nor more forcibly reveals the trend of our intellectual and industrial life and activities than the sixty-eighth annual California State Fair, which was auspiciously opened this morning.

"In scope and wide interest it certainly presents some features that are pivotal in their nature, and others in the way of improvements that show a development and an appreciation of what an institutional affair like the present really reveals.

"Many people are of the opinion that an exposition is merely a display of farm and orchard products, implements and appliances typifying the progress made, resources enjoyed and advantages offered of the certain geographical area in which the soil products and educational advantages take their origin. This is the narrow and more or less mercenary view; in a much broader sense a well conducted state exposition is an educational institution, informative on every branch of an enlightened agricultural and horticultural practice, on the advances and improvements made in the arts and manufactures, and on the educational and intellectual life of the inhabitants of the state."

Reports are that attendance is fine, the weather is fair and the exhibits of the finest.

## OLIVES AT A PROFIT

Articles by Mr. Drew, president of the newly organized California Olive Growers, and Mr. Ludwig, a grower-packer of Oroville, have called attention to the situation facing the California olive producer, and today the olive producer is scratching his head and wondering how he is going to "get by" with costs of producing his olive crop. This discussion has been wonderfully interesting and has not been ended for again we have from Mr. Ludwig the following:

Your article in the issue of August 26th, "Olives at a Profit" shows that you have not taken the trouble to get a grocer's viewpoint, who is doing a legitimate grocery business in country towns as well as in the large cities, for a grocer has to handle articles where he has no margin at all, consequently in order to get by, he has to make it up on other goods; stating the grocer's profit in percentage on certain goods is very misleading, as in many instances where the price is low the profit percentage is high, while in higher priced articles the grocer's profit percentage is rather low compared with the former and olives so far have not become a staple article like canned milk or other canned fruits, but the grocers still have to be induced to carry a line of canned olives, consequently the grocer has to be taken care of.

You further state that I have taken good care of the packer, which shows that you have not consulted a legitimate olive packer who was willing to enlighten you as to the correct and complete cost of canned olives including overhead expenses, for I may state that I have not considered in my figures any profit for the packer, and all the overhead expenses, as manager's salary, depreciation, interest, insurance, etc., have been based on Mr. Drew's pack of 450 tons of olives as stated in a former issue, and if you will take into consideration the value of a plant of that capacity, you will find that the depreciation, etc., reduced to a tonnage basis, will approximately correspond with my figures, and unless I am shown in detail (for this is a matter of facts and figures only) where I am wrong I am positive the grower gets very little, if anything for his olives, and as far as Mr. Drew's statement is concerned, that his growers would still get $100 for their medium olives, I positively state that it cannot be done. I am not only a grower but also a packer, being a member of a cooperative association, just the same as Mr. Drew is, and in my figures I have allowed for the better and longer experience which Mr. Drew's organization may have had in the packing game.

I fully realize that it will be very difficult for you to obtain the exact figures from Mr. Drew, for it would require a financial statement of their affairs to prove the figures, but you no doubt could obtain a confidential cost sheet from some olive packer, who is in a public spirited frame of mind, and which would give you something for comparison. The writer desires nothing better than that public spirited growers will do a bit of pencil work and determine to support the right kind of cooperation.—E. Ludwig.

Yes, but the trouble is we do not get the producer's viewpoint. The grocers are looking altogether too well after the comfort of the consumer. This is shown first by the enormous number of grocers established in and around every community. Any thickly settled community near a large city has groceries so thickly established that one cannot throw a stone without breaking a grocer's window. It takes immense profits to support this great array of institutions. Immense profit to grocers means loss to producer and consumer. True cooperation means a study of these marketing problems and reduction of these middlemen costs. It must be done or the olive industry must cease in California. The Cultivator is hoping the olive industry will live forever. Again, if the packing is so managed that a packer's overhead of $60 or $70 per ton has got to be unloaded onto the shoulders of the producer, that of itself will drive the industry from the state. We are not appealing for injustice to the packer. If he is going to stay in the business he must live. But if he is content to continue his business at costs which the business will not pay for there can be but one result.

The trouble is that in transportation, marketing, packing we have always begun at the wrong end and figured up profits for packer, middleman, distributor, transportation, then finally backed up to the grower and said, "Here's what we have got to have, what are you going to do about it?"

## FLORIDA-CALIFORNIA

We recently commented on Florida and California citrus conditions and production. Especially did we refer to California's grapefruit possibilities which many in Florida did not appreciate, further, to the immense field in Florida where oranges might be produced, a fact not fully appreciated by many California growers. Especially did we comment on California's standardization of one or two varieties and the large number of varieties shipped from Florida. Editor Wright of the Florida Grower corrects and gives the Florida viewpoint as follows:

"Editorial was very fair. Of course you will always have the summer grapefruit market. I do not think that even our Marsh Seedless compare with our other varieties. I doubt if California will ever be able to send (market) many grapefruit to the East through the winter in competition with Florida, Isle of Pines and Porto Rico grapefruit. You were not quite fair to the Temple as it has never yet been marketed in quantity; there has never been a carload of it shipped and of course it has not had opportunity to make a place for itself, but it will I firmly believe. Also it will be a few years yet before we reach the production in oranges that California has attained. I think you ship something like 20,000,000 boxes. Our shipments of oranges alone will hardly reach 8,000,000. However if you had given me time to have taken you down the Ridge section south of Haines City I think I could have convinced you that the time is not far distant when we will be shipping 20,000,000 boxes.

"Most of our early shipments are Parson Brown and seedlings. We have comparatively few genuine Parson Browns, very few Lue Gim Gongs. I have read of the Surprise Navel but never saw one and doubt if there are a hundred cars a year and our Rubies are few and far between. The bulk of our orange shipments today are Seedlings, Pineapples and Valencias; of course quite a few tangerines."

Vol. LIX, No. 11 Los Angeles, September 9, 1922 One Dollar Yearly

# Electricity on the Farms in California

## By H. C. Rice, Southern California Edison Company

ELECTRICITY, more than any other single agency, is making the farm life of California more nearly ideal. California farmers were quick to take advantage of electric service for pumping, feed cutting, running milking machines and the lighting of their homes and barns. In fact, it is a matter of record that more electricity is used on the farms in California than is used by all of the farmers in all of the states of the Union put together.

This wonderful, invisible servant, after having worked wonders in cutting the farmer's labor, is now entering the realm of Mrs. Farmer in earnest. The dishes are washed in an electric dish washer; the clothes are washed and ironed electrically; when preparing a meal the utensil is set in the oven or on the cooking unit of her electric range, the switch is turned and the food is cooked. There is no fire to tend; no coal or wood to bring in; no ashes to carry out; no matches to strike; no burner to light; no dust; no dirt; no gas or oil smell; no overheated room; no greasy walls and curtains; no fuss; no bother; and if she has an automatic range her food is cooked while she attends the club or is visiting her less fortunate sister in the city.

Why, then, doesn't every home cook by electricity? It is because the house wife and her husband are frightened away by the mistaken belief that it costs too much, but anyone who approaches the subject with a desire to make a comparison between the monthly cost of using an electric range and of using a coal, wood or gas range, and then adds up the many advantages of cooking electrically, will decide that it will pay them to put in the electric.

Why do people buy electric vacuum cleaners which cost $50 when brooms can be bought for $1.00? Why do men buy typewriters for $100 when pen and ink ony cost 10 cents? How can they sell electric fans at $15 to $30 when palm leaf fans are given away? It isn't the price of the thing that counts, it's the value of the service that goes with it. The automobile manufacturer doesn't sell an engine and four wheels with seats on top. He sells quick, comfortable transportation, and the man who buys never stops to compare what it would cost to purchase and drive a horse and buggy.

The advantages of cooking by electricity are many and very definite. It is easy to list them to see what they are worth:

### Reliable Heat

Cooking electrically produces better food, because good cooking ceases to be the result of good guessing. On the electric range there are a certain number of cooking places, heating units, on which you stand the utensils containing the food. Each unit is controlled by a switch which gives three degrees of heat; full, medium, and low. Medium heat is just one-half as hot as full heat. Low heat is just one-quarter as hot as full heat. These different degrees of heat are absolute. They never vary or fluctuate. They are the same today, tomorrow, or next week, and for every meal. Your heat and your cooking is, therefore, under absolute control. It doesn't need watching; it needs timing—that is all. And the time it takes to do the same amount and kind of cooking is always the same. Poor coal, a sooty flue, a dirty stove, a windy day, or unusual humidity never slows down your cooking and makes the dinner late. Your oven and top never get too hot and burn. Naturally, the result of all this is better food. The oven of the electric range is heavily insulated and operates on the fireless cooker principle. This prevents much food waste and conserves the juice and flavor of the meat and baked dishes.

Yesterday good cooking was the product of good guesswork, favorable conditions, and the utmost care in stirring, basting, and shifting the food. Cakes fell, roasts were over or under done, and bread was a success or a disappointment according to whether the fire was good or bad. But today the electric range gives the housewife a piece of scientific equipment that puts the results of her cooking entirely under her control, and, in a word, this means better food. This is the greatest benefit from electric cooking.

### Simple and Easy

Cooking electrically makes cooking easier. There is no fire to prepare and watch, for any desired degree of heat can be secured by the turn of a switch. There is no fuel to order, store, or worry about, neither coal nor wood to carry, no matches to buy, find and scratch, no flue to operate, and no ashes to dump and carry out. It relieves the cook of the most exacting, confining and exasperating of her duties, and also of one of the most wearying, if there is coal to carry.

### Absolutely Clean

Cooking electrically is cleaner, because the heat of an electric range is developed in the wires of the cooking units. These wires may be either enclosed or exposed to view. There is no flame and no combustion; therefore, there are no fumes, no smoke, no sooty pots, no discolored walls. There is no coal dirt, no ash dust falling in the food and being breathed continually, and the air is not exhausted and deadened.

### A Cool Kitchen

Cooking electrically is cooler, for the electric range is a cooking device and applies its heat directly to the cooking. Coal and gas ranges throw off much of their heat into the room, and in summer the advantage of the electric range is appreciated. The kitchen stays cool, and the cook is not tired out with weariness from the hot room. The refrigerator may stand in the kitchen without loss of ice.

### No Danger

Cooking electrically is safe. There is no flame. There is no danger of fire, explosion or asphyxiation. Liquids may boil over without accident. Children may play near the range without risk.

### Economical

Cooking electrically has economic advantages. It brings a great saving of food, through eliminating spoilage, and through the conservation effected by the insulated fireless cooker oven. It saves much time and work and worry because things do not need watching and pots are not discolored and, therefore, do not need to be scoured continually. It cuts down the kitchen drudgery and makes it easier to keep a maid or to do the work without a maid.

All this, of course, has a money value. It pays to have better cooking and better food, because it requires less food to give the same amount of nourishment. It saves money to reduce the food wasted in spoilage and in inefficient ovens. The ease, cleanliness and coolness of electric cooking all save money by reducing the time and labor consumed in cooking. The housewife's time has a productive value and is worth money, just as the servant's time costs money. Consider the scouring of pots, for instance. Ten pots and skillets are used a day, we will say. Is it worth a cent a time not to have that pot discolored on the outside every time it is used? If so, the electric range saves three dollars worth of pot scouring every month.

The advantages of cooking by electricity are, therefore, in money, in the quality of food, in time, labor, and trouble saved, in cleanliness, coolness and healthfulness, in convenience and comfort, and in the opportunity gained for more rest and recreation. The cost of these benefits and the extent to which any woman will enjoy them will depend very largely on her recognition of the fact that cooking electrically means more than just cooking on an electric range.

### Care and Judgment Count

What it will cost her is largely a matter under her own control, dependent on the extent to which she is willing to revise cooking habits or persists in doing things the old way instead of the electric way. If she turns on the heat before it is needed, and does not turn it off immediately after the cooking is done, it costs more money. If she wishes to boil a vegetable and, when the boiling has commenced, neglects to turn the switch to "low," which is sufficient to maintain the boiling, it costs more money. If she heats a lot of water three or four times, when once would be sufficient to answer for all, it costs more money. It is in the power of the cook to make electric cooking economical or expensive.

It is hard to get right down to dollars and cents because the cost of cooking by electricity depends on so many things—the rate for current, the number in the family, the character of the cooking, and, then, the care used by the operator, as I have said. The thing to do is to take the average figure for the average family, and base your own estimate on that.

There are approximately 4,000 electric ranges in use on the farms in Southern California at the present time, and one company having over 3000 ranges finds that its average income per range per month for the year 1921 was $4.58. This, based on the average size of 4.2 persons per family, would make approximately $1 per month per person for the cost of electricity for cooking. This exact figure cannot be used for estimating the cost for a larger or smaller family, because another person more or less will slightly increase or decrease the bill. The character of the cooking is also a big factor in the monthly bill. If breads and pastries are baked constantly and soup stocks are frequently made, it means more cooking than if much bread is bought and there are few stock soups. But the same consideration applies to the cost of cooking by any other fuel also. Care and judgment save expense and the lack of it runs up the bill.

The farm homes of California are second to none in the world. There is only one other spot on this globe that even remotely compares with California as to climate or scenery, namely, the Riviera in southern France and Italy. A visit to that famed spot and a close inspection of the living conditions of the farmers there will only strengthen our love for our own state, where, with the tremendous hydroelectric development programs of our virile western companies, hundreds of miles of copper wires are being strung from the mountains to the sea, bringing that master servant of all time, "electricity," to our very finger tips, at the touch of a button.

## MEETING OF SHEEPMEN

A meeting of the sheepmen of the northeastern portion of California, comprising Modoc County and part of Lassen County has been called by President George E. Williams of the Modoc Wool Growers Association, for Friday, September 29, at Alturas, Modoc County. The meeting has been arranged for the purpose of forming a branch association of the California Wool Growers Association.

This section, more or less isolated from the central part of California, has been at the mercy of the buyers. A considerable number of the wool growers on account of not being posted as to market conditions contracted their wool and lambs last spring at prices much below the prevailing prices received later in the year. The sheep ranges are going very fast and regulation is required for grazing. Sheep scabies in Lassen County has caused the state department of agriculture to issue a proclamation that no sheep shall be moved from that county except upon authorization of either the state or federal governments

In order to talk over these various questions several of the directors of the California Wool Growers Association have been invited to attend the meeting, among whom are F. A. Ellenwood, president; Frank Bullard, treasurer; A. T. Spencer, chairman of the transportation committee; G. N. Merritt, chairman of the legislative committee, and W. P. Wing, secretary. The college of agriculture will have a representative present. The state department of agriculture will be represented by Dr. C. P. Iverson, chief of the department of animal industry, and the California crop reporting service by E. E. Kaufman. Following this meeting tentative arrangements have been made to hold a meeting of the Lassen County sheepmen at Susanville.—W. P. Wing, Secretary.

# Agricultural News Notes of the Pacific Coast

## Northern California

The prune harvest is well under way.

Sugar beet harvest has begun in Sutter Basin.

The dove season opened, September 1 for the entire state.

Antioch claims the first carload shipment of Flaming Tokays.

A course in horticulture has been added to the curriculum of the Placer union high school.

The sixth annual reunion of Placer County will be held at Mosswood Park, September 10.

Sonoma-Marin Counties have three big cooperative creameries, at Bodega, Pt. Reyes and Petaluma.

Mendocino County supervisors have appropriated $1500 to cover expenses of an assistant farm adviser.

The Santa Rosa chamber of commerce is raising funds to aid in the egg tariff fight in Washington.

Members of the state water resources board will be in Chico, September 25. Board is making tour of Northern California.

The Western Pacific railroad has filed protest against construction of the state highway at the north fork of the Feather River.

Reforestation in a systematic way is being carried on by the Fruit Growers Supply Company on its 85,000 acres of properties in Lassen County.

An active demand is reported for feeder lambs in Tehama County, inquiries coming from as far away as Imperial and Los Angeles Counties.

Sonoma and Mendocino Counties hop growers are said to be short of pickers. They are hoping for influx of pickers after the apple picking season.

Dredging of Oakland harbor from the mouth to San Leandro Bay will commence about November 1 under direction of United States army engineers.

Farm Adviser Harrison of Yuba County has been active in introducing new grasses on the ranges in that county. Hubam especially is reported to be thriving.

More than half of the money spent annually for fruit in the United States is paid to Californians, says Vice-President Peltier of the California National Bank of Sacramento.

At a largely attended meeting of the Glenn County unit of the American Farm Bureau Federation a committtee was appointed to investigate feasibility of establishing county library.

The railroad commission has restored freight rates on paddy rice to a basis of 25 per cent in excess of grain rates and ordered reparation to the shippers in excess of this ratio.

The big new packinig plant of the California Prune and Apricot Growers at Colusa will be ready for operation the middle of September. There will be no carton packing at this plant, prunes being put up in 25 and 50 pound boxes.

Glenn County farm bureau meetings: Directors, Willows, September 9; Codora, 11; Orland, 12; Plaza, 15; Capay, 20; Glenn, 22; Grapevine, 27. Farm home department meetings: County committee meeting, September 9; Jacinto, 13; Ord, 14; Westside, 21; Lake, 27.

## Central California

Tulare County fair begins September 13.

The Merced-Los Banos highway is open for travel.

Pixley, Tulare County, will have a municipal water system.

A number of moving picture films have been made of Don Pedro dam.

An industrial exposition will be staged in Modesto, September 30-October 7.

An appropriation of $1,000 for survey of flood control was made by Merced city trustees.

A 9,000 acre tract north of Merced will be headquarters for a large seed growing concern.

The new Sun Maid Raisin Growers plants at Dinuba and Yuba City are ready for operation.

The Merced County farm bureau will place an exhibit at the Delhi community fair, September 14.

The annual picnic of the Merced County farm bureau will be held on the Merced River, October 14.

George A. Williamson of Terra Bella reports a price of 6 cents a pound on the tree for his Kadota figs.

A basic price of $3 a ton has been set by prune growers of Tulare County for picking, for dry yard work $3 a day.

The mountain apple crop in the Milo district of Tulare County is lighter than last year because of heavy spring frosts.

Terra Bella peach growers are getting $60 per ton for their Tuscans from the California Canning Peach Growers.

Tulare County shipped 61 carloads of cantaloupes during the 1922 season. Many truck shipments were made in addition.

An exhibit of tobacco leaf and manufactured tobacco products was sent from Crows Landing to the state fair at Sacramento.

President Giffen of the Sun Maid Raisin Growers is urging growers of Muscats not to sell fresh grapes for less than $30 or $35.

Tulare County is harvesting its prune crop. The yield is estimated at ten per cent less than last year owing to heavy drop.

An active warfare against puncture vine has been started by the Tulare County farm bureau, county supervisors and city governments.

A survey of Merced County to determine amount of damage done by larvae of sphinx moth is planned by Horticultural Commissioner Welty.

The Merced-Stanislaus Sweet Potato Growers Association has renewed its activities. M. D. Vierra is president. The association will extend its marketing activities.

Out of state shipment of Bellflowers started from Watsonville district, August 28; local shipments. September 3, by agreement of the state standardization bureau and the apple shippers.

Peach growers of Winton, Merced County, forced to dry an unusually large percentage of their fruit because of the strike, have been unable to obtain sufficient trays. They let the fruit dry on trays for a few days then remove to strips of heavy paper to finish.

## Southern California

Cotton gins in the Imperial Valley are running double shifts.

Fumigation is about over in the Redlands and Highland districts.

A big good roads celebration was held at Julian, San Diego County, August 26.

The southern branch of the University of California at Los Angeles opened September 5.

The Upland district of San Bernardino County expects an 80 to 90 per cent crop of lemons.

Orange County supervisors have declined to make appropriation for home demonstration agent.

The Fontana section of Riverside County expects to ship out approximately 1000 cars of grapes.

Fire started by lightning in the San Jacinto mountains has kept a force of 100 fire fighters busy this week.

El Chivar Ranch of Redlands has sent many of its milk goats to the state fair at Sacramento this week.

Orders for frost fighting equipment are being placed and many orchards will be fully equipped by November 1.

Olive groves will produce rather under normal crop but growers are reporting exceptionally large fine fruit.

The annual picnic of the Pioneer Society of the Pomona Valley will be held in Ganesha Park, September 30.

The Citrus Belt Milk Goat Association held its annual picnic and election at Ganesha Park, Pomona, August 19.

Walnut growers of Southern California met last Saturday at Santa Barbara in their annual Walnut Field Day.

The farm adviser's office of Santa Barbara County is in its new quarters at 117 East Anapaum Street, Santa Barbara.

A series of 12 soil moisture meetings in Los Angeles County begins September 11. Dates will be announced by farm adviser.

Horticultural Commissioner Coy of San Bernardino County estimates that county's Navel crop at 55 per cent of normal, Valencias at 70.

The sugar factory at Anaheim is operating. The beet crop is expected to be about one-third less than last year because of less acreage.

Fumigation of citrus groves in the Riverside district is progressing at the rate of 100 acres a night says Horticultural Commissioner Bottel.

Grape Day, or the annual grape festival, held for many years on Admission Day, is being held this year, Saturday of this week at Escondido.

A mass meeting of apple growers of Yucaipa Valley was held at Yucaipa, August 21 to plan for the Apple Festival, November 9-12. David Coey was named general chairman.

Packing houses are running on tag end of the Valencia crop. There are now less than 2,000 cars to go and probably the entire output will be cleaned up soon after November 1.

Based upon estimates returned by shippers of the California fruit growers on August 1, California will ship during the season November 1, 1922, to October 31, 1923, approximately 51,340 carloads of oranges, lemons and grapefruit.

## The Coast and General

Cotton picking has begun in Arizona.

Price for packing pears in the Yakima Valley of Washington, 5 cents a box.

Washington cherry growers made several shipments to Eastern markets via the Panama Canal.

Apple shippers of the Hood River Valley, Oregon, are already suffering from shortage of cars.

A heavy shower in the lower Yuma Valley caused considerable damage to alfalfa seed and cotton.

Light showers in range districts of Arizona and New Mexico have kept pastures in good condition.

Because of unusually warm weather cotton picking in Arizona will start a week earlier than anticipated.

Southeastern Idaho fair at Blackfoot, September 19-22. This will be one of the largest district fairs this year.

The Truckee River route from Truckee to Reno was endorsed by a big mass meeting at Reno last week.

Ravages of red spider made it necessary to begin the hop harvest at Silverton, Oregon, before hops were fully matured.

The Northwest Fruit Exposition will be held at Seattle, November 11-19, instead of October 28 to November 5 as first planned.

Favorable stock conditions are reported in northwestern New Mexico, but only fair in the southwestern portion of that state.

The Arizona Pima Cotton Growers' Association reports receiving gratifying support from growers, bankers and the farm bureau.

Because of crop shortage the Eugene Fruit Growers' Association, Oregon, received only 430,000 pounds this year, against 1,300,000 last season.

A shipment of 3,000 head of steers, mostly yearlings, was recently made from Mohave County, Arizona, to Coconino County, at five cents a pound.

Cattle raisers of Graham and Cochise Counties met in semi-annual ctnference at Wilcox, Arizona, September 3 and 4, to discuss marketing problems.

Salt River Valley of Arizona reports yams sizing up rapidly though hot weather and heavy irrigation are developing excessive vine growth which may reduce yield.

Egg, butter and poultry dealers in Kansas City have made formal complaint to the Interstate Commerce Commission against the service given country shippers by the American Express Company.

The maximum freight rate on fresh fruits and vegetables in mixed carlead lot from Los Angeles to Tucson has been cut by the Interstate Commerce Commission from $1.19½ per 100 pounds to 86½ cents.

Cotton pickers below the line in Mexico will receive from 80 to 85 cents per 100 pounds for picking cotton this year. An estimated yield of between 80,000 and 100,000 bales has been set for cotton ranches below the line.

The lettuce growers of the Rillito and the Postvale districts around Tucson are beginning early to organize for an effective and profitable crop. Most of them are members of the Pima Produce Growers' Association, which will build two packing plants.

# Gumming of Deciduous Fruit Trees

In the Cultivator of July 29 on page 104 Leonard Coates refers to the gumming of deciduous trees. Again in the issue of August 12, page 153, Dr. Snowden referred to deeply covering the root crown as a cause of gumming with citrus, and in that article he asked the Cultivator to initiate a symposium on the subject. The first to respond is C. A. Nidever of Paso Robles. Mr. Nidever now sends his conclusions.

By C. A. Nidever

When a fruit tree throws out gum it indicates a bad condition somewhere. It may be in the root or branch, a dry soil or a wet soil, sunburn or a borer. In fact, it may be anything, for gumming is merely a symptom, not a disease. The gum that oozes out is thickened sap. It is thrown out by nature because it is sour or wrong otherwise. In contact with the air it thickens and forms white or amber colored gum.

A slight gumming of a tree is no cause for alarm. Young prune trees gum on a slight provocation. Almonds hardly ever gum. Apricots gum easily and especially if frozen back.

The main cause of gumming is climatic conditions. There are other causes such as bacterial and fungus diseases but they are rare when compared with climatic causes. The past winter was ideal for conditions causing gumming. The ground was cold and waterlogged from January to April. There are certain water plants that thrive in such conditions—such as the cranberry which grows only in a bog, but a cold wet soil means death to a California fruit tree if continued long enough.

A tree is fed by very small rootlets, called root hairs, which grow out from the roots near the tip ends. These root hairs are so small that a microscope is used to examine them properly. These small root hairs twine among and clasp the fine soil particles and extract plant food from them, which is carried to the tree through the sap. These root hairs are the mouths of the roots.

Under a cold waterlogged condition of the soil, such as California had last winter for three months, many of these root hairs are killed, consequently the tree cannot properly feed the leaves and fruit that set on when the growing season started. The trees then put out gum, turn yellow and many of them die. Some of the trees live through the summer before they die and some recover. It all depends how badly they were hurt. There is very little that can be done for a tree in that condition. Even if they recover it is doubtful if they are worth nursing along. As a rule a sick tree is like a sick chicken—the best cure is the axe.

It is very doubtful if there is any connection between gumming and the depth of the root crown. There is nothing in plant physiology that supports such a theory. When a seed is planted, that which grows down is the root. There is no fundamental difference in the two. Whether the plant sets lower or higher in the ground makes no difference as a rule.

When a graft is made with two stocks that have an affinity for each other a complete union is made and the two stocks are as one. After they are well knit it makes no difference whether the union is above or below ground. In fact, some trees, such as the apple and pear, will send down roots from the stock above the crown if it is set deeply enough in the ground.

Young trees from the nursery should not have the union covered through a wet cold winter for two years at least after setting. It is a shock to a tree to transplant it, and to leave a portion that has been growing above ground in the nursery lie under a cold wet soil through the winter sometimes rots the bark. After a tree gets well under way, say two years, there is no danger in covering the union as it would be in the ordinary tillage necessary to maintain proper soil conditions.

Some seven year old prune trees under observation that have been in fine growing shape up to this year show about 30 trees in a ten acre field that are in all stages of dieback. Some are entirely yellow and some are already dead. All show signs of heavy gumming. In some places only half the tree is dead. Some of the root crowns are above the ground while others are below.

Prune trees 36 years old and still in a vigorous growing condition had crowns in all stages from a foot under ground to as much above ground.

The sudden death of a tree from sour sap is easily distinguished from the lingering death from a wet, cold soil. In sour sap the tree lives or dies and has it over with, but in the case of a wet, cold soil the tree turns yellow and sometimes drags through the summer and even matures a crop. The bark and cambium appear dead. Sometimes the cambium builds up again under the dead bark which can be observed by cutting into the bark. Such a tree might be worth keeping and should not be destroyed until the fall when it can be judged better whether it will make a tree or not.

When the root stock does not die a tree can be built up rapidly by grafting at the ground. The large root system already established will build up a tree much faster than a tree just out of the nursery. The Myrobolan plum root is very hardy and seldom dies.

A reasonable percentage of dieback this year should not be discouraging. The cold wet weather of last winter is a rare occurrence.

Sour sap was not so plentiful last spring as dieback from a water logged ground. Sour sap is caused mainly from growing weather starting off early and then a sudden change back to cold weather again. The sap starts to flow and is checked by the cold weather. The tree puts out buds as usual in the spring and then dies. Sour sap affects the whole tree or any part of it. The whole side of the tree may die or just one branch. A sour sapped tree dies early, rarely gets past the blooming stage. With dieback from a cold, wet soil the tree lingers at all stages through the summer.

Many trees that died back this spring were actually frozen last winter. Brown rot was blamed for a lot of blighted apricot buds and limbs that died from cold. One man was told that he had brown rot in his apricot trees. He insisted that it was winter kill and sent samples to the university. They ran a culture for brown rot but failed to find any. Their verdict was winter kill. The two look very much alike. Heavy gumming is a symptom of all the troubles enumerated above. Gumming, or gumnosis as it is sometimes called, is a warning that there is something wrong with the tree just as a headache in a man is a sign of eye strain or a disordered stomach.

A tree gets 96 per cent of its solid substance from the air. The remaining 4 per cent mineral matter, combined with the sap circulating system, which all come from the soil through the roots, are very important factors in the health of the tree. Any condition of the soil that retards the proper functioning of the roots will soon show signs in the distress of the tree above ground.

The available plant food in the average soil is usually less than 1 per cent by weight. In other words, all the plant food in 100 feet square could be put in one corner one foot square. The roots of a plant must forage over the whole 100 feet to get the food. The physical condition of the soil must be right for the plant to work properly. There are many conditions necessary to plant growth, but heat and moisture are the main governing conditions. When these two go wrong you can look for trouble. In the dieback this spring we can see the effect of wrong conditions last winter.

Continuation of comment on page 263.

# Some Native Shrubs and Trees

By Leonard Coates

Low growing and drouth resisting shrubs should be a very prominent feature in California decorative gardening whether on the town lot or massed on large acreages. Many that are especially useful, though but little known under cultivation, are native to California, some deciduous, some evergreen. Most of them, particularly the natives, are difficult to propagate by seed, and of very slow growth for several years. The seed is hard to get. Many trips into the hills and canyons are necessary; first, to locate the shrubs in bloom, and afterwards to collect the seed just at the proper time. If a day late, or if a squirrel gets a few hours start, the work is lost. Many of the native shrubs and trees seed themselves on burnt over land, but one great difficulty the collector has to contend with is the lack of fertility of seed, which is somewhat disheartening after he has located the plants in bloom, his later trip being fruitless.

A simpler and quicker way to get a stock of certain wild shrubs is through offshots or layers. It is also necessary if it is desirable to propagate any plant of marked characteristics as all seedlings are subject to variation.

### Layering

I have been surprised at the ease with which most of these shrubs are propagated by layering, the only essential being bending down and keeping covered in moist earth for several months a branch of the shrub it is wished to propagate. Sever it when strong enough, and plant in nursery row somewhere near its original home, where it should remain for one year. It may then be handled or shipped, due care being taken.

Some enthusiastic farmers and tree lovers are in the habit of taking up offshoots or natural layers from many of our native shrubs, packing them in moss, and shipping to some nursery or private planter. This usually results in compete failure, although there are exceptions. It is too risky, however, financially, unless the plants are established at least a year in nursery rows, and preferably near their native habitat.

The wax berry (Symphoricarpus) both white and red, is one of our commonest shrubs. It spreads rapidly by long, trailing arms, and is very useful for a low massed effect. The Oso berry (Nuttalia) is a taller, larger leaved shrub, bearing clusters of large yellow, red and purple berries, which follow the rather insignificant drooping racemes of greenish white flowers. It is sometimes locally known as Wild Cherry, from the appearance of the fruit.

One of the most interesting of all our native shrubs is Chilopsis linearis, known by the Spaniards as Mimbres, and locally as Flowering willow, Desert willow, etc. It is deciduous, with fine, willow like foliage, but belongs to the bignonia family. The flowers, in upright racemes, resemble those of the catalpa, but smaller, pale lilac, with yellow dots. Its habitat is far to the south in the dry canyons and arroyos; hence the common name Desert willow.

I have a specimen, 600 miles north of its native home, which in less than three years, has grown to 4 feet 1 inch in height and 5 feet in diameter, and is now full of bloom. It is therefore adaptable and will succeed anywhere in California where sunlight prevails.

Wax myrtle (Myrica Californica) grows into a small, dense headed tree. I have found it in the pine woods near Pacific Grove and have seen it flourishing in private grounds in Saratoga, under two very dissimilar climatic conditions. The foliage is very dark and flowers small, but the very large white wax like berries are a marked feature. The foliage has a pungent odor, which prevails with so many native shrubs. Especially is this characteristic of the California laurel (Umbellularia) which grows into a large tree in the northern part of the state, valuable for timber, and the allspice (Calycanthus) growing in canyons along the creeks in the coast range. This is a striking shrub, with its arge, bright green leaves and magnificent maroon flowers.

Several species of Ribes would group well with Symphoricarpus, mentioned above. Incense shrub, or Flowering currant, wild gooseberry (R.

speciosum) and wild currant (R. tenuifolium) are all very good. The latter makes a very large shrub, with beautiful yellow blossoms; fruit red and edible. The Red Bud or Judas Tree of the eastern states is well known, but its California prototype, Cercis occidentalis, is rarely seen outside of Yolo, Lake, and other northern counties, where in early spring the hillsides are gorgeous with its brilliant crimson flowers.

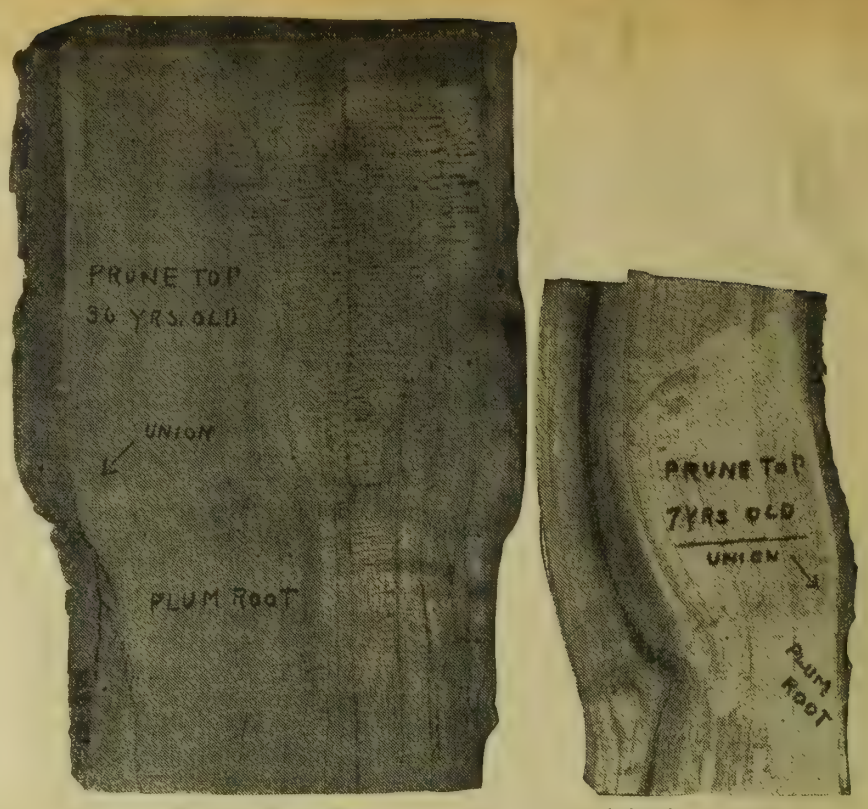
Flowering Ash (Fraxinus dipetala) with its rich glossy foliage and clusters of white, fragrant flowers, forms an exceedingly pretty small tree.

A broad, spreading shrub of rapid growth is the Indigo Shrub (Amorpha) with locust like leaves, flowers in long spikes, almost black, with golden stamens. It would make a good background.

Holly leaved cherry (Prunus ilicifolia) is well known as one of our best hedge plants. The Catalina Island variety (P. integrifolia) has larger foliage, lighter in color, and forms very handsome individual specimens. Both have panicles of white flowers, followed by large purple fruits.

Few seem to be aware of it, but we have several native species of Philadelphus, sometimes wrongly called Syringa. One species is quite fragrant, and P. Lewisii is a sight when covered with its white bell like flowers. Styrax Californica, or Storax, is much less common. Its flowers are borne in drooping panicles, resembling snowdrops. I have found it in Kings River Canyon and now find that it grows as far north as Lake County. Several dogwoods (Cornus), are very attractive, especially C. Nuttalli, with very large flowers. It is found in the northern counties. There are a dozen or so species of Ceanothus (Mountain lilac) with flowers ranging in color from white to a dark blue, and occasionally pink. C. thyrsiflorus in the moist woodands of the coast becomes a tree 15 or 20 feet in height; its flowers are deep blue. C. Spinosus has glauous foliage, light blue flowers in very large, often drooping panicles, while C. verrucosus and some others are low growing with white flowers. C. arboreus grows on some of the islands off Los Angeles, bears very large showy blue flowers, handsomer even than the cultivated European hybrids.

The chamisal or chaparral (Aden-



Cut from Budded Trees Showing Perfect Union of Stock and Bud

Specimens of root crowns sent by C. A. Nidever. Mr. Nidever writes: "The large one is from a tree 36 years old that has been dead several years. The small one is a seven year old prune tree that was in first class growing condition up to this year when it died back with a crop nearly ripe. The bark and cambium have been as dead all spring as they are now on the specimen. The tree was evidently getting food up through the sap wood but not sending any back to the roots, for the fruit was abnormally large. The union was above ground and as you can see it was perfectly healed. A dark colored wood shows in the heart of the young tree sample which might develop into heart rot but I don't believe that it would. If it is heart rot it got in before the union healed and could have no effect on its dying suddenly this year. By looking at the top of this young specimen you can see the ring of the original tree. The wood has been built out from that in perfect shape. There is no chance of any leak in the union, which is the only reason that I can see that it would be harmful to cover the union. If the connection is not perfect then it should be removed for the tree will always be weak."

ostoma), and the grounsel tree (Baccharis) cover some of the dry hillsides. As individual cultivated specimens they would hardly be recognized, but exclaimed over because of their beauty.

Berberis Californica is allied to B. aquifolium, or Oregon grape; it is one of our most beautiful evergreen shrubs with the varying shades of green and red foliage, bright yellow flowers and blue berries. Fremontia is difficult to propagate, but a specimen is well worth the price. Its flowers, gorgeous yellow and wax like, are magnificent. Carpenteria, or tree anemone, has very large, fragrant white flowers. Under cultivation it makes a grand shrub. Then our native tree poppies, Romneya and Dendromecon, the former the "Queen of Flowers," the latter, her page.

The manzanita (Arctostaphyllos) and the madrone (Arbutus Menziesii) as the most typical of California's shrubs or small trees must be mentioned. The manzanita exists in several species, A. pungens and A. glauca being best known. They will grow well from layers, and, after being established in some container for a year, can be moved anywhere. The madrone makes a fair sized tree, and when fertile seed is obtained it is not difficult to grow, but requires frequent transplanting before it is set permanently. Typicaly Californian, and unsurpassed for beauty, it should be in every collection.

The list grows, so that one hardly knows where to stop. There are many others, but all of the above will thrive almost anywhere in the state, and they are all native to California. My object is to try to create a demand for these trees and shrubs so that California nurserymen will be encouraged to propagate them. There is a wide field open. The digging up and exporting of our native bulbs should be prohibited by law, but the collecting of seed of our native plants, trees and shrubs should be encouraged.

# Save the Groves and Orchards of California!

It is a recognized fact that the citrus groves and orchards of California are deteriorating. This is due to lack of nourishment. Unless trees receive properly balanced food they slowly starve to death. The most important soil essential is Available Calcium Carbonate—and the constant cropping and irrigation of the soil of this State is gradually using it up. The ultimate result is scrawny, weak trees and small unprofitable production.

## Available Calcium Carbonate Gives Life to Fruit Trees

Available Calcium Carbonate sets at liberty the Phosphoric Acid, Nitrogen and Potash to make them readily obtainable by trees and other plants. With the proper addition of Available Calcium Carbonate trees take on new life—produce large, delicious fruit abundantly and turn poor paying orchards into profitable ones.

The most Available Calcium procurable is found in Marine Shells and Bones.

**If your orchard is not producing properly investigate this product. Send for our folder "Available Calcium as a Fertilizer." It will be sent free to orchardists.**

## GUMMING OF DECIDUOUS FRUIT TREES

By W. R. Wood

(Continued from Page 261.)

We agree with Mr. Nidever that probably the excessive gumming of deciduous trees the past season was largely due to climatic conditions, and possibly in his particular case the loss was entirely due to these conditions, but we believe that trees planted too deep are more susceptible to gumming than those planted as they should be, especially if planted on very heavy land. Trees planted on light well drained soil will no doubt do about as well whether planted deep or shallow, but where the soil is heavy there is danger in planting too deep. Of course the danger is not as great with deciduous trees as with citrus. To the latter it almost means certain death if the bud union is below the ground in heavy soil.

We can not agree with Mr. Nidever in his statement that after a bud union is perfectly healed, it makes no difference whether this union is above or below the ground. There is a decided difference in the varieties with respect to their soil and climatic likes and dislikes, and this is one reason for using different root stocks. A variety that does not do well on heavy soil is budded or grafted on to a root that thrives on such soil, and if this bud union is planted below the surface or for any reason becomes covered to such a depth that the bark above the bud union is continually in contact with this moist heavy soil the chances of the tree gumming are much greater than if the bud union was well above the ground.

There is also a difference between budded or grafted trees and seedlings. While the bud may make a perfect union there is a difference between it and the root that shows throughout the life of the tree, and this difference, although it may be slight, affects both the top and the root. In some varieties the lack of affinity between the two is very marked while in others it is hardly noticeable, but by cutting through a section of a tree at the bud-union it will be noted that there is a well defined line between the two stocks, showing from the heart to the outer edge of the wood. In the writer's opinion this variation or offset, no matter how slight, has some effect on the flow of sap both to and from the tree top, and if through any cause there is a clogging or interference with the free flow of the sap it breaks through the bark at the weakest part, which is oftentimes at the bud union. This is more noticeable in citrus trees. With deciduous trees the breaking out may be farther up on the trunk or in the branches, but the bud union may have contributed its part toward starting the trouble. At any rate we believe that the safest plan is to plant young stock at as nearly the same depth as it grew in the nursery.

## OYSTERS OF YESTERDAY

By Ernest Braunton

THE other day the writer ventured forth to visit a deposit of marine shells in Orange County, to see what such things look like, and afterward to visit some of the farmers who had used this material, to find what material benefit it had been to them.

The so-called mine was on top of the ground, with nothing to uncover, but two or three inches of soil in places overlying outcroppings for a mile or so in each direction. There is enough high grade calcium carbonate in sight to furnish the whole state for some years to come. Though largely decomposed, oyster shells in a fair state of preservation may be found throughout the mass, chambered inside of each other to the number of a half-dozen or more. They appear as though some child had placed them carefully in this way and then some gigantic force had squeezed them into a mass but a half inch thick (for an actual measurement and count made of seven shells thus layered). A few scallops are also in evidence but the majority are oysters, though mere shells of their former selves.

The writer was anxious to find an orchard where shell lime had been applied to part of an orchard and the remainder left as a check plot, but this is a point neglected by those who have used it, so one can but observe the general good and listen to the praises of the orchard owners who believe the results they have obtained are due entirely to applications of calcium carbonate in the form of decomposed sea shells. The first one quoted herein had the nearest to check plot comparisons of any visited.

### What Happened

F. E. Jones lives just below Santa Ana, post office address Route 1, box 56. Mr. Jones was not at home but Mrs. Jones cheerfully accompanied the writer over the seven acre orchard and told the following story: "We bought this much run down place ten years ago, rooted out the old Navel oranges, though first inter-setting with young Valencias, leaving none of the Navels more than two or three years. To provide plant food we started a small dairy and a poultry plant. For seven years the dairy and poultry manure was applied, plowed under and irrigated every 30 days. But the soil seemed dead and the fertilizer not acting, for the trees did not satisfactorily thrive.

"So Mr. Jones concluded in 1920 that he might as well stop and get some money direct from the manure through sales. Now he is selling the total output. In April, 1921, he applied to part of orchard ten tons to the acre of this sea shell lime. In a few weeks both trees and soil were in such improved physical condition that he applied a like amount to the remainder. The color and size of the foliage, and the young growth, are the best of the whole ten years. In spite of the freeze, the degree of injury of which you may judge by the dead wood, the trees are well loaded with a crop of fine promise."

Several other orchards were visited and all appeared to have been much benefited by calcium carbonate in sea shell form. The writer would like to see this material given many trials, on different types of soils, but always with a check plot where none is applied, so that the measure of the benefit may be at least approximately determined.

## NUT EXPERTS

A Cultivator representative attended the annual meet of the California Walnut Growers Association at Tucker's Grove, near Goleta, seven miles north of Santa Barbara, last Saturday, a full account of which will appear next week. The attendance was about 825. All the nut experts were there. One of the speakers, George E. Farrand, said he was in attorney's office lately when a professional appearing man entered and asked who were the best local nut experts. The lawyers didn't know, so asked him. He named them, and the man said: "Well, I want to see them at once. I hope to prove by them that a client of mine now in the psycopathic ward is sane, so he can make his will." These nut experts were with us Saturday.

---

Eighteen hundred tons of pea vines produced in the county have been purchased by dairymen of the Marin County farm bureau for feed. Most of the vines were siloed and are showing excellent results in milk production. Five new silos were erected to be filled with pea vines.

Electric —— Dish Washer!

—another Servant for Country Homes

AFTER THE HEAT and heavy work of summer, you will especially appreciate the labor- and time-saving advantages of an Electric Dish Washer. Besides its convenience and practical utility, an Electric Dish Washer is much cleaner and more sanitary than the old methods of doing dishes and drying with towels which become wet and soiled. It costs no more to operate than the burning of the 100 watt lamp in your front room.

An Electric Ironer, Vacuum Cleaner and Sewing Machine would also help to lighten your work and give you a chance to rest up.

The next time you are in town, CALL ON A DEALER WHO HANDLES THESE ELECTRICAL APPLIANCES. Get full information regarding cost of operation, etc.

# Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When queries are wished in Cultivator address query to 317 Central Ave., Los Angeles.

### Second Hand Engine

I bought a stationary engine supposed to be in first class condition. The engine broke down. I had a machinist examine it and he found that the vendor had, after taking the pistons out, replaced them upside down so that it had worn the cylinder. When replaced correctly it causes such play that in a short time it will break again. Could I collect damages?—Subscriber, Bakersfield.

This was a second hand engine, bought from a person not engaged in merchandise. Apparently there was no warranty concerning the engine as the question states that it was "supposed" to be in first class condition. The injury might have been caused by ordinary use of the engine and the former owner might have believed it in first class condition. The general rule is that a mere contract of sale or an agreement to sell doe not imply a warranty so that it is highly probable that no action would lie under the circumstances.

### Intoxicating Beverages

A justice of the peace has held husband and wife guilty of manufacturing intoxicating beverage. Is it or is it not legal to make small quantities of intoxicating beverages in the home?—Subscriber, Covina.

In view of the fact that the judgment was rendered by a police court it was undoubtedly under a city ordinance. Many cities prior to the enactment of the 18th amendment had ordinances concerning the manufacturing, sale and disposal of intoxicating liquors, violation of which would render a person guilty of misdemeanor. The general rule of the 18th amendment forbids the manufacture, sale or disposal of intoxicating beverages. Congress in the Volstead act has held that beverages containing more than one-half of one per cent alcohol are intoxicating beverages, and the officers of the government enforcing the Volstead act have also held and the courts have backed them in the holding that such manufacture is unlawful.

### Cows Not as Represented

We purchased cows on contract. One went bad, which we sold to the butcher. The others have not properly performed. The vendor agreed to make an exchange but refused to do so. We contracted to pay a certain amount per month, but the vendor has accepted less. Must we stand the loss on the cows? Can the vendor take the cows back, or will he be obliged to accept what we can pay?—Subscriber, Hynes.

Your first remedy was rescision upon ascertaining that the cows were not as represented. This action must be taken promptly, however, and you must restore to the vendor all you receive. In view of the fact that one of the cows was sold to the butcher you cannot make this restoration. The second remedy is an action for damages for difference in value of cows as represented and as they were. As you were purchasing upon a sale contract this difference in value would be applied on the balance due under the contract, and you could be required to pay what remained over. The condition of any such action is that the contract be affirmed and your payment be made in accordance therewith except for deduction as stated.

### Lease Terms

I had a tract of land and leased it for three years. I furnished the seed, and lumber for irrigation boxes. The lessee was to plant the seed and put in the boxes. He was to receive all the crops for the first two years, but the third year I was to receive one-third or its equivalent. The lessee had the right to sublease. He has rented a part of the property for cash and now desires to make me accept one-third of the rent instead of one-third of the crops. What can I do?—Subscriber, Orange.

You are entitled to insist upon the exact terms of your lease and to require the delivery of one-third of the crops or their equivalent. The parties who sublet are deemed to have had knowledge of the terms of the lease which you have with your tenant, and their leases are taken in subjection to the terms of your lease. Unless your tenant complies with the terms of his lease by paying one-third of the crops or their equivalent, you are entitled to bring action in the usual manner of unlawful detainer and have both him and his tenants ejected

### Damage to Automobile

A widow owns an automobile, used both for pleasure and business. It is also used by her two minor children. She is called away on business and forbids the children to drive the car. But they took the car out and afterwards requested some other boys and girls to drive this car while they got in another. The car overturned and considerable damage was done to the car. Is the driver of the car alone responsible or who are?—Subscriber, Gridley.

It would appear that no principal of contract is involved in such matter, but that all of the children were joint wrongdoers, and all might be equally held responsible. This on the theory that the widow's children informed the others, as the details of the question state, that they had no right to take the car out.

### Support of Family

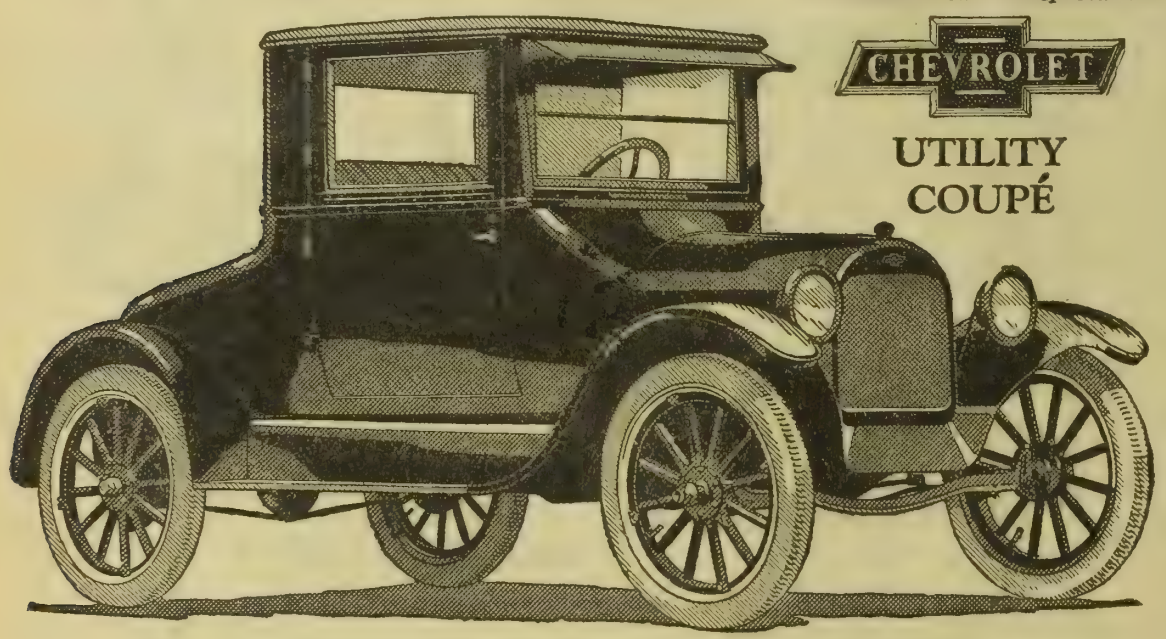
Is a wife entitled to a divorce because the husband cannot make more than $100 per month? If so, can the husband claim the custody of the boy? If she gets the child will the husband be required to pay for the child's maintenance more than six months in the year?—Subscriber, Oakland.

The grounds for divorce in this state are adultery, extreme cruelty, wilful desertion, wilful neglect, habitual intemperance and conviction of felony. The failure to make more than $100 per month does not fall under any one of those heads. In any such action however, the question of the disposition of the child is within the discretion of the court, as well as the amount and character of the payment necessary for the support of such child. It is the general duty of the husband to provide for the support of the child and this applies whether or not the husband has the custody or even the right to see the child.

*For Economical Transportation*

CHEVROLET

UTILITY COUPÉ



The Lowest Priced
High Grade Closed Car

$680
f. o. b. Flint, Michigan

This is the car for the country.

No new model Chevrolet has ever met with such quick success with farmers. It is just what they have long wanted—a high-grade closed car at a surprisingly low price.

Like every other Chevrolet model it offers unmatchable VALUE.

The high-grade Fisher Body is practical as well as handsome. The extra large, heavy plate-glass windows afford clear vision on all four sides.

The mammoth rear compartment with locking cover contains 14 cu. ft. of space for luggage, packages, produce and merchandise of all kinds.

The upholstery is in gray whipcord—wide, comfortable, well-sprung seat and back—easily kept clean. Equipment includes standard three speed transmission, vacuum feed, cord tires.

The chassis is the Superior Chevrolet with that celebrated valve-in-head motor, which has been an important factor in giving us first place in sales of standard equipped automobiles.

No matter what car you own or think of buying, you owe it to yourself to see this all-weather Utility Coupé and COMPARE IT for value and low mileage costs.

Farmers know car value. That is why they are buying this model by the thousands.

BODY by FISHER

Chevrolet Motor Company, Detroit, Michigan
*Division of General Motors Corporation*

World's Largest Manufacturer of Low Priced Fully Equipped Automobiles

5,000 Dealers and Service Stations Throughout the World

Applications will be Considered from High Grade Dealers in Territories not Adequately Covered

### Community Property

If a man has judgment standing against him can his wife hold a home which she has earned?—Subscriber, Claremont.

All earnings of either husband or wife are community property and community property is subject to levy of execution for the debts of the community or husband. The method whereby such home could be protected would be by filing homestead which would protect it up to $5,000.

### German Confiscated Property

Where can I obtain data with respect to German confiscated property?—Subscriber, Stockton.

As to any details it would be necessary for you to communicate with the Alien Property Custodian, Washington, D. C.

### Lease to Japanese

Does the law prohibit one leasing land to Japanese for agricultural purposes? Is any distinction made between cash rent and crop rent?—Subscriber, Carpenteria.

The law does not prohibit any such lease but provides that the state may bring action to cause the interest acquired to be escheated to the state. The law makes no distinction between rental upon a cash or crop basis. A recent decision held that the alien land law does not apply in questions of crop rent on the theory that under such leases no interest in the land is conveyed. It is understood, however, that this case is on appeal so that until a final determination great care should be taken in having any such transactions.

### Willing Community Property

There is community real estate which is deeded to both husband and wife. In case the wife dies first does all the property go to the husband where there are children? If she makes a will specifying that at her death one-half of the property goes to the children and the husband signs such will would that hold good?—Subscriber.

The expressed presumption by law is that wherever any property is conveyed to a married woman and to her husband the married woman takes the part conveyed to her as tenant in common unless a definite intention is expressed in the instrument. This is a presumption of law and it is possible to overthrow it by evidence satisfactory to the court. If it is community property then upon the death of the wife the whole of the property descends to the husband. If, however, it is held that the wife was a tenant in common of the property her estate is entitled to an undivided one-half interest. It would seem that the signing of the will by the husband would be evidence that the husband recognized the fact that the wife was a tenant in common. If such was not the case the wife would have nothing to will and it would therefor be an idle document.

### Pump a Part of Land

Several months ago we moved on a ranch expecting to lease it. No lease was signed and we intend to move in a few weeks. When we moved here we installed a new motor and pump. Can we move this property away?—Subscriber, Galt.

When a person affixes his property to the land of another without an agreement permitting him to remove it the thing affixed belongs to the owner of the land, unless he chooses to require the former to remove it. Consequently upon affixing a pump to the land it became a part of the land as much as the buildings thereon, and you would not be permitted to remove it.

### Community Property to Husband

Have the children of first wife any right in the property acquired under the first marriage?—Subscriber, Stockton.

Upon the death of the wife the entire community property without administration belongs to the husband. There was an amendment changing this rule but the amendment was repealed by referendum at the last election.

### Trees on Highway

I have several large acacia trees fronting my property which I wish to remove and replace with shrubbery. I am told these belong to the county and cannot be taken out by me. Can you tell me if this is correct or not?—Subscriber, Cudahy.

Trees in the highway can be removed only by permission of the proper authorities. Many of the counties have adopted the provision of law permitting the appointment of a county forester. In such counties this permission must be obtained from this official. Where such act has not been adopted then application should be made to the supervisors or to road commissioner in the district. On the state highway it probably would be necessary to obtain consent of state highway commissioner.

### Rights in Road Frontage

What rights has a property owner in his frontage along a public road? Can advertisements be placed on the roadside in front of his property? Can livestock be picketed there? Can travelers camp there, leaving trash and litter, all without his permission and against his will?—Subscriber, Coachella.

It is a misdemeanor to put up, affix, fasten or paint upon any property belonging to any of the governmental divisions or dedicated to the public, or upon any property of any person without license from the owner, any notice, advertisement or designation of any commodity. Under the motor vehicle act it is made a high grade misdemeanor for any person owning or controlling possession of any horse or other livestock to voluntarily or negligently permit such animals to stray upon or remain unaccompanied by a herder or other person in charge or control thereof, upon the public highway, either side of which is subjoined by property which is separated from such highway by fence, curb, lawn or building, and no person shall feed, pasture or camp any such livestock upon any public highway between the hours of sunset and sunrise without keeping a sufficient number of herders on continual duty to keep open the road so as to admit at all times a ready passage of vehicles and also keep red lanterns or lights burning to warn the public of the presence of such stock. Further under such motor vehicle act it is likewise a high grade misdemeanor for any person to leave standing or permit to be left standing upon the main traveled portion of any public highway a vehicle undergoing repair or for the purpose of camping.

### Lost Check

In January, 1917, a creamery gave a check. The check was lost, subsequently found and placed in the bank for collection. It was returned. Is the check still good?—Subscriber.

Undoubtedly it is barred by the statute of limitations as an action upon any contract, obligation or liability founded upon an instrument in writing must be brought within four years from the date.

### Bankruptcy

What property is exempt under the bankruptcy law and what does one do to invoke this act?—Subscriber, Van Nuys.

A person desiring to become a voluntary bankrupt must prepare a prescribed set of schedules setting forth all of his assets and liabilities and assign to the trustee in bankruptcy all of his property. It requires the payment of $30 for fees, and there are some additional fees for publications and so forth. California has liberal exemptions covering in fact some three pages. Generally speaking however, household furniture, implements of trade, earnings of the judgment debtor for 30 days preceding filing of petition, and a small amount of agricultural implements, horses and cattle are exempt.

### Exempt from Attachment

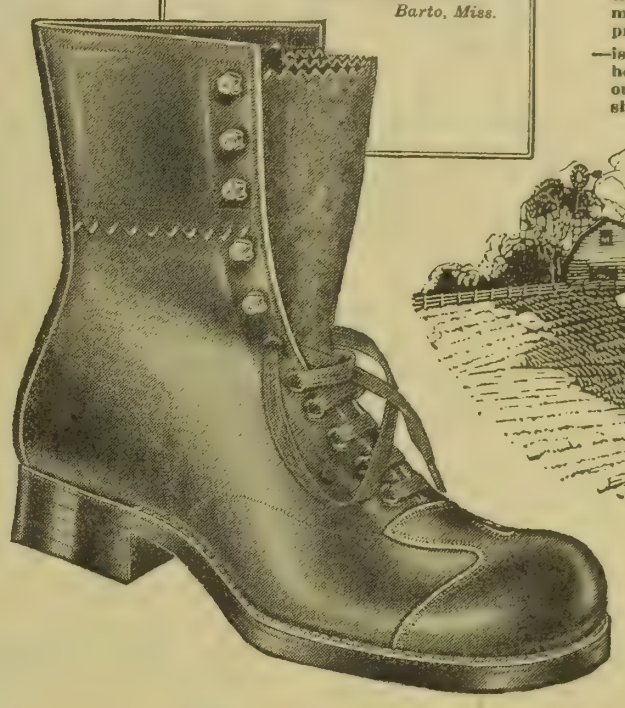
I advanced money to a party with the understanding that I was to be repaid when the material upon which he was working was sold. This was not done. Can I attach his machinery

WOLVERINE!
The 1000 Mile Shoe
Wears Longer—Stays Soft

*We purchased a shipment of Wolverine Shoes about two years ago and they gave us the best wear of any shoes we have ever handled. In fact two of our customers are just discarding shoes purchased from that lot and are demanding the same shoe again.*
*R. L. Fuller & Co.*
*Barto, Miss.*

**The Only Shoe That—**

—will always stay soft and pliable after wetting.
—has leather that is doubly tanned—both vegetable and mineral tannage—our secret process.
—is made wholly of special horse hide leather that will outwear any other known shoe material.



# The Plowboy

***Made by Specialists***

We are specialists. We make workshoes *only*. And no other shoe is made like the Wolverine.

After every soaking it always dries out soft as new buckskin, and as comfortable.

No other shoe we know of will do this. It is due to our own exclusive, secret, double-tanning process.

We take selected horse hide, the toughest, longest-wearing leather known. This is the leather that formerly went to Europe to make expensive Cordovan shoes and Cossack saddles. The Wolverine is the only workshoe we know that is made of this quality leather.

We tan it in our own tannery by our secret process. We give it the pliable softness of buckskin. Yet by this process we retain all the toughness of the horse hide and even increase its extreme durability. It wears and wears and wears.

Such a shoe is amazing. Yet by the operation of our own tannery we effect economies that bring you the Wolverine at a very modest price.

**WOLVERINE**
**Comfort Shoe**

**This Wolverine is so pliable and soft you can double it up like a moccasin. It wears like iron but you'll hardly know you have a shoe on, it is so soft and easy.**

**For tender feet, or where you do not encounter wet weather, wear this Comfort Shoe. A blessing to the feet.**

**A Wolverine for All Work**

There is a Wolverine shoe for every kind of work. Soft, flexible shoes for field and shop; heavy, hi-cut, leg-protecting shoes for teamsters, lumbermen, oil men; every one made wholly of our double-tanned, soft horse hide that always outwears other leather and always stays soft.

The Plowboy model shown is designed especially for plowing. It is high enough to keep out dirt, low enough for coolness. Like all Wolverine shoes it is so soft and comfortable you can walk in it all day without tiring. Wherever comfort and long, long wear are wanted Wolverine are the shoes to wear.

If your dealer cannot supply you, write direct to us. Send the coupon for catalog.

and tools for the amount involved?—Subscriber, Ramona.

As to machinery it would be necessary to specify what that machinery is. But, generally speaking, the tools or implements of mechanics or artisans are exempt from execution, otherwise you would be entitled to take your action and have your remedy by way of attachment.

### Government Grant

The government once granted a tract of land and described it by metes and bounds and said it contained 10,000 acres; in fact, it contained 20,000 acres. What is necessary to establish the claim to the extra 10,000 acres?—Subscriber, Springville.

Unless there is some claim made by somebody or other it would hardly seem that there is any litigation necessary. It is the general rule that where there are definite particulars in description, the addition of others which are indefinite or unknown or false does not frustrate the conveyance. When there are inconsistent measurements, that of angles is paramount to that of surfaces and that of lines paramount to both. When permanent and visible or ascertained boundaries and monuments are inconsistent with the measurements, the boundaries or monuments are paramount. Thus it would seem that the description by metes and bounds would be conclusive.

### Turning Flood Waters

Has a town on river a legal right to build a levee to prevent flooding when by so doing large amounts of flood water are thrown on the opposite side so that orchards will be badly damaged?—Subscriber, Watsonville.

It has been held that one has a right to protect himself against flood water, that is, water escaping from its natural course. For that purpose he may obstruct the flow upon his land even though such obstruction causes the water to flow on to the land of another, but such cases require careful study. It would probably be far better for you to take the matter up with your local attorney.

### Trees Not as Represented

I purchased Phillips Cling peach trees from nursery. They came properly labeled, were planted and three years later produced some peaches. Not one was a Phillips Cling; they were all sorts of different varieties and are worthless to me. What can be done?—Subscriber.

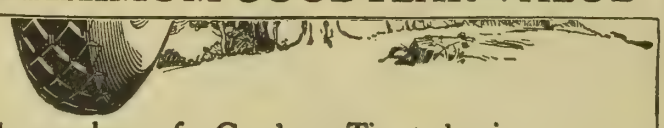
You undoubtedly have right to action for damages upon breach of warranty of quality of personal property. Your measure of damages in such case is the excess of the value which the property would have had at the time to which the warranty referred, if it had been complied with, over its actual value at that time. This means the time when the breach thereof is, or with due diligence might be discovered by the purchaser; and the proper method of ascertaining such difference in case discovery cannot be made after the trees are planted is to take the difference at the time of discovery between the value of the land as planted to the trees delivered and the value such land would then have had, if it had been planted, with trees of the kind warranted by the seller. This is the rule which has been followed in cases along this line.

### Naturalization

Three years ago a British subject married an American woman. Six months from now he will be naturalized, becoming a citizen of the United States. Is it possible for him to again become a British subject for two years without making it impossible to again take out naturalization papers in the United States, when the two years are over?—Subscriber, Oakland.

He is of course a British subject until he finally takes the oath of allegiance to the United States. He can renounce this oath of allegiance and again become a British subject, but if he desires to a second time apply for naturalization papers it would be entirely within the discretion of the court to refuse naturalization, as it is never the policy of governments to treat so lightly a solemn matter such as the taking of the oath of allegiance. This discretion would naturally arise under the requirement that the alien must show that he is attached to the principles of the constitution of the United States and well disposed to the good order and happiness of the same. The court could undoubtedly take the view that a person so recently becoming a citizen and renouncing his allegiance could not be attached to the principles of the constitution to such an extent as to qualify him as a good citizen.

THE MAXIMUM GOODYEAR VALUE



The purchase of a Goodyear Tire today is an investment in known quality.

What that quality is, has been proved by the public over a period of nearly a quarter of a century.

In that time, by uniformly fine performance, Goodyear Tires have attained unquestioned leadership.

More people ride on them than on any other kind.

Goodyear Tires never have been so good, never so serviceable, as they are now.

Veteran users say they give more than twice the mileage they did twelve years ago.

Yet Goodyear prices are at the lowest point in our history.

Never before has Goodyear value been so great.

*Goodyear Means Good Wear*

# Questions and Answers

**Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.**

### Pruning Oranges

Please give me some general ideas on pruning Navel orange trees. Will it hurt trees that have not been pruned for some time to give them a severe pruning?—Subscriber, Lincoln.

Orange trees need very little pruning, if properly headed when first planted. Sucker growth and interfering branches should be kept pruned off, also any limbs that extend out so as to interfere with cultivation. After the trees reach the bearing age it is advisable to keep all the dead wood pruned out of the center of the heads. This promotes the setting of fruit on the inside as well as the outside of the tree. Above all things do not prune an orange tree like a hedge by clipping the outside branches, as this tends to make the top so dense that no sunlight can penetrate it and thus increases the amount of dead wood on the inside and weakens the tree generally. Unless your trees are in a sickly condition we do not think a severe pruning is necessary. Only where the trees show a sickly condition is it necessary to cut them severely, and then from one-quarter to one-half the top should be cut away, depending on the severity of the case. Even then it would be best to examine the soil and root system and try and ascertain the cause of the sickness and if possible remedy it.

### Budding Walnuts

Will you kindly advise me where to apply to have my walnut trees budded and approximate cost per tree? I have about 160 trees, the oldest in their sixth year and ranging down to replants in their second year and on black walnut roots. So far these trees have not had irrigation except by tank wagon for short time after setting out, but are vigorous. Ranch is in San Joaquin County in Farmington fruit belt, in heavy chocolate loam soil close to creek. Are not walnut trees more susceptible to frost injury after being budded?—Subscriber, Hawthorne.

Would suggest that you take the matter up with some nurseryman in your section. There are nurserymen at Stockton, Merced, Modesto and other close by towns that either have men in their employ or can advise you of parties who do this work. Grafting is the most satisfactory method of working over walnut trees and the work should be done in the spring just before the new growth starts to come out. English walnuts are susceptible to frost injury, especially if the cold weather comes before the trees have become hardened up for winter. As the trees get older, however, they become more resistant and frost damage is less liable to occur. We do not know that they are any more susceptible to injury from frost when grafted on black walnut stock than when grown from seed excepting that the grafts make a more vigorous growth and are therefore more tender when young.

### Growing Plums from Sprouts

Will a sucker from a cherry plum tree bear fruit every year or do they skip three years before they bear again? Will they bear as well as nursery stock? Where can this nursery stock be gotten?—Subscriber, Eureka.

We do not quite understand your question. The cherry plum (Prunus myrobalana) is used as a root stock on which to bud or graft the commercial varieties of plums and prunes. We presume that you refer to the French method of propagating by sprouts. It was claimed that sprouts from certain varieties would not gum as badly as trees grown in the usual way. As far as time of bearing is concerned we do not think there would be any difference. It would no doubt take the sprouts as long to come into bearing as it would trees grown from seed. It is possible that the sprouts would come nearer producing fruit in quality and quantity like the parent tree than trees grown from seed. Any of the general nurserymen can no doubt supply you with either seed or seedlings of this variety.

### Prunes Drop

German prune tree is thrifty, blooms and sets fruit but most of them drop off when very small. Does it need other pollenizer? I read in some farm paper to bore a hole in the trunk of the tree and fill with sulphur. Then plug the hole, and the fruit would stay on the tree. What do you think? Subscriber, Stevinson.

We understand that the German prune has a habit of dropping its fruit before it reaches maturity. It is possible that this might be overcome by planting some stronger variety nearby but it would have to be one that bloomed at the same time. Some of your local nurserymen could no doubt assist you in making the proper selection. We do not think that the boring of holes and filling them with any kind of substance will be of any benefit and is quite apt to kill or permanently injure any tree treated in that manner.

### Split Pits

Please tell me why the pits of plums and peaches split open. We have the prune plum and about two-thirds of the pits break open.—Subscriber, Pasadena.

"Split pits" of the peach and prune was investigated by the California experiment station some years ago but no cause for this condition was found. Certain varieties seem to have a larger percentage of split pits than others, and it is probably due to a weakness of the variety.

### Full Efficiency from Pump

My 5 inch centrifugal pump does not seem to throw enough water. Some mechanical principle has been violated somewhere. The pit is 5 feet deep; water level, 3 feet below bottom of pit; well, 174 feet deep; stand pipe three feet in diameter, 14 feet high with 7 inch discharge and 10 inch concrete pipe line. Water level in stand pipe, depending on where I am irrigating, is 8 to 12 feet above ground. Adding 8 feet to water, the pump lifts the water 16 to 20 feet, plus the decrease in level due to suction. Is that an excessive lift? How about the pressure exerted by the column of water 3 feet in diameter and 5 to 9 feet in height above discharge inlet? The water actually delivered is not less than two-thirds of what neighbors get. It is not prohibitive in cost. The neighbors say that my trouble is most likely due to the well not having sufficiently enlarged the cavity at the bottom so that the water level drops when the pump starts. I haven't measured the water level when pumping. Considerable sand is still pumped. It caused the water jacket to fill up with sand until I put in a settling barrel.—Subscriber, Caruthers.

It would seem to us that your trouble is due to a shortage of water in your well or your pump does not run fast enough. If you have no vacuum gage on your pump it would be necessary to drop a float in the well between the suction pipe and the casing to get the depth that the water is being drawn down. By adding the depth of suction to the height of discharge

you can ascertain your total lift. All centrifugal pumps are built to deliver a certain amount of water based on the total lift and speed. If the lift becomes greater it will be necessary to speed up the pump in order to get the same amount of water. If air bubbles appear in the water as it is discharged it indicates that the pump is getting air either around the packing gland or through the suction. However when much air is being pumped it soon forms a block in the pump and the water stops until the air block is released. With belt driven pumps it often happens that the belts get loose and there is a considerable slippage, thus reducing the speed and correspondingly the volume of water discharged. We would suggest that you find out from the parties who furnished the pump just what speed it is supposed to run at to deliver the desired amount of water and then by the use of a speedometer you can ascertain whether or not it is running up to speed. The only change we could suggest in your discharge pipe would be to put on a tee in the place of the L, where it turns to empty into the 3 foot standpipe, and put on an additional 12 feet of 7 inch casing. This would relieve the friction at this turn and might give you a little more water. However if the L at this point is of the long radius type the standpipe would not benefit much.

### Wooly Aphis

Kindly inform me as to the best spray to use and the best time of year to kill the cottony pest that is now growing on my apple trees. Where may I learn something of the life, history and nature of the pest? What is its name?—Subscriber, Van Nuys.

Presumably this is wooly aphis. If still in print secure copy of "Injurious and Beneficial Insects of California" by writing State Department of Agriculture, Sacramento. See pages 78, 79 and 80. Even more extended description of life habits and method of control is given in Monthly Bulletin, Vol. 6, No. 10, October, 1917, page 390.

### Building With Stone

I have on my mountain ranch an abundance of granite rock of every size of which I should like to build a good sized house and garage and apple storage. Where can I get information, plans and the right kind of builder for this work?—Subscriber, Long Beach.

The building of a house is a trade by itself and we question the advisability of a novice attempting such construction without the help of an expert. However, where one has somewhat of a knowledge of practical building there might be an experience worth while in attempting to build a house. As to the handling of cement which would perhaps be safest in building up stone wall the best information can be secured by writing Portland Cement Association, 111 West Washington Street, Chicago, Illinois. This concern has issued a series of pamphlets on cement construction. The Macmillan Company, New York, J. B. Lippincott Company, Philadelphia, T. Y. Crowell Company, New York, publish numbers of special engineering and other books. Possibly they could supply you with a technical publication which would prove of value. As to a builder, or one to direct in the work, practically every neighborhood has a good stone mason. If busy he may possibly be able to refer you to others.

### Salting Ensilage

Can you tell me if salting corn ensilage when filling the silo will improve the feeding value?—Subscriber, Watsonville.

Salt is not generally added to silage. If the silo is air tight it adds nothing to the keeping qualities and some think prevents proper fermentation of the silage. If the silage is old and if the corn is old and has become overdry then pure water is added to be sure the moisture content is sufficient and the curing process is complete without any additional material.

### BEAUTIFUL THINGS

Beautiful faces are those that wear—
It matters little if dark or fair—
Whole-souled honesty printed there.

Beautiful eyes are those that show,
Like crystal panes where hearth-fires glow.
Beautiful thoughts that burn below.

Beautiful lips are those whose words
Leap from the heart like songs of birds,
Yet whose utterance prudence girds.

Beautiful hands are those that do
Work that is earnest, and brave, and true,
Moment by moment, the long day through.

Beautiful feet are those that go
On kindly ministries to and fro—
Down lowliest ways, if God wills so.

Beautiful shoulders are those that bear
Ceaseless burdens of homely care
With patient grace and daily care.

Beautiful lives are those that bless—
Silent rivers of happiness,
Whose hidden fountains but few may guess.

Beautiful twilight, at set of sun;
Beautiful goal, with race well won;
Beautiful rest, with work well done.

Beautiful grave, where grasses creep,
Where brown leaves fall, where drifts lie deep
Over wornout hands—O beautiful sleep!
—Anon.

### THE COLDEST PLACE

**By Clara Peterson**

IT was too bad that the apple tree belonged to Miss Sarah Lizard who owned the sandy hill that sloped down to the beach. The apple tree stood, straight and wide and beautiful, in the center of the slope, and near its roots Miss Lizard had a little house of sand. It didn't cost her much to live for she was very fond of the flies and bugs that buzzed all around. Of course she never once thought of eating one of the big red apples on the tree and in spring she never even used the apple blossoms for her table.

But in the rabbit nest next door were two little bunnies who wished and wished that that apple tree belonged to them. Their folks were poor and often had to spend all day pulling weeds for Farmer Peacock down the road so the two bunnies were alone many times.

The baby bunny's name was Ruthie. She was snowy white but her eyes were pink and her tiny tail was black. Robert, her brother, was bigger and his fur was a lovely golden brown. Often he sat beside his baby sister in the long grass and wished and wished and wished that the apple tree belonged to him for then Ruthie might have something she really liked to eat. Then he would stop wishing and scurry through the grass until he found a delicious clover for Ruthie. To tell the truth, both bunnies were quite thin and hungry all the time for there weren't many clovers and the grass was very tough.

"I think I'll go into the nest and sleep till muvver comes," said Ruthie one cool afternoon when she had watched the apple tree so long that she was very hungry, and away she hopped.

Robert hopped to the edge of the grass and cocked his head as he looked down toward the tree for thump, thump, thump the apples were falling on the sand, round and red and ripe and juicy.

"Oh, dear!" sighed Robert.

And then something happened. Miss Sarah Lizard came running up from the beach. She was waving her little front paws and moaning. Now and then she wiped her eyes with her small black apron.

"He's lost! He's lost! I'll never find him—never, never, never!" she said over and over again.

She held her apron to her eyes and hurried on until she bumped straight into Robert who was so busy watching her that he had taken two hops forward and was sitting on the sand.

"Oh!" screamed Miss Lizard, looking up at him. You see she had never been so close to a rabbit before and he looked at least as large as an elephant.

"Ex—excuse me," mumbled Robert, backing away. "Maybe I can help you find him—whoever he is."

Miss Lizard began to moan again.

"He's lost—entirely lost! It's my little nephew, Christopher Lizard. He is spending the day with me and he has such a cold that I wasn't to let him out of the house at all. We both took a nap in the sun and he got up first and ran away. Oh, oh, oh!"

"I'll scamper everywhere and look," said Robert, and off he went. Miss Lizard searched sadly through some of the long grass and then she went back and sat down on her little porch and cried.

It must have been half an hour later that she heard Robert talking.

"Hurry along, now, please, Mr. Lizard. Your aunt is worried. Now, now, don't try to get away. I'm watching you!"

And there out upon the sand crawled little Christopher Lizard with Robert hopping slowly behind him.

"You good, good rabbit!" cried Miss Lizard hugging her nephew who looked very sulky indeed. "Where did you find him?"

"Lying in the dark mud under a snowball bush," said Robert Rabbitt.

"Under a snowball bush! screamed Miss Lizard. "Why that's the coldest place in the world—and you with such a cold! You might have died, Christopher! You know your mother told you to keep in the sun every minute you weren't in the house."

"I'm tired of being melting hot all the time," grumbled Christopher, and he crawled into the little sand house and began to munch a fly sandwich.

Miss Lizard put down her apron and began to smile.

"My, I was worried, Mr. Rabbit! Thank you so much. I do wish I had something to give you. We had a delicious mosquito pie for dinner but it is gone—Christopher did love it!"

Just then the biggest apple on the tree fell off "kerthump" and rolled up beside Robert's foot. He just couldn't help bending over and smelling it, for oh, how sweet it was!

Robert must have looked very hungry for Miss Lizard said, "I don't suppose—that is, you don't like these funny hard apples do you?"

Then Robert told her that he and his baby sister and his mother and his father liked apples the very best of anything.

Everybody was happy after that for Miss Lizard was glad indeed to have the bunnies take all of the bothersome red apples out of her yard and you should have seen Ruthie sitting in the sun and munching, munching, munching until her little stomach was full!

### HINTS FROM HOUSEKEEPERS

**Some Good Recipes**

I have received your answer about the pectin and also the Cultivator for June 17. You don't know how I appreciate your kindness and in turn I am giving you a few recipes which are excellent and that I have never seen in the Cultivator. With the heartiest thanks to you for your answer I remain a Merced Subscriber, and a fond reader of the Cultivator.

Egg Plant—Peel and slice, putting into cold water about half hour. Slice 2 or 3 onions fine and put in saucepan with 3 or 4 spoons of butter or fat and brown slightly. Then add 1½ tablespoons flour and 2 cups bouillon or meat stock. Put in egg plant slices and cook 20 or 25 minutes. Peel 3 or 4 large tomatoes and add, cooking all until done. Just before serving beat 2 eggs, add to boiling sauce and boil 2 minutes. This is Italian style.

Tongue Ragout.—One small beef or 4 calves tongues. Scrape clean, cover with boiling water, add salt and soup greens. Bring slowly to boil and simmer till thoroughly tender. Remove scum while cooking. Take off skin and slice. Melt in sauce pan ¼ pound butter, add two small onions chopped fine and brown with 3 tablespoons flour, Add enough of the liquor from the tongue to thicken. Add 3 slices of lemon, pepper and vinegar to taste, 1 cup chopped sweet or sour pickles and 1 small can French mushrooms if liked. 1 teaspoon browned sugar gives a fine color. Boil all together 10 to 12 minutes. This tastes very good with dumplings of any kind.

Beef Kidney Italian Style.—Cut beef kidney in two lengthwise, re-

## The Cultivator Patterns

**4080. Misses' Dress.**—Cut in 3 sizes: 16, 18 and 20 years. An 18 year size requires 6⅜ yards of 32 inch material. The width of the skirt at the foot is about 2¼ yards. Price 10 cents.

**4085. Girls' Dress.**—Cut in 4 sizes: 8, 10, 12 and 14 years. A 10 year size requires 4¼ yards of 32 inch material. Price 10 cents.

**3705. Ladies' House Dress.**—Cut in 7 sizes: 36, 38, 40, 42, 44, 46 and 48 inch bust measure. A 38 inch size will require 6¾ yards of 27 inch material. The width at the foot is 2¼ yards. Price 10 cents.

**4091. Girls' Dress.**—Cut in 4 sizes: 2, 4, 6 and 8 years. A 2 year size requires 1½ yards of 32 inch material. Price 10 cents.

**4097. Ladies' Dress.**—Cut in 6 sizes: 36, 38, 40, 42, 44 and 46 inches bust measure. A medium size requires 5¼ yards of 32 inch material. To make underbody, sleeve facings, and vest portions of plain material as illustrated 1¼ yard 40 inches wide will be required. The width of the skirt at the foot is 2⅝ yards. Price 10 cents.

**4088. Girls' Dress.**—Cut in 4 sizes: 6, 8, 10 and 12 years. A 10 year size requires 2⅛ yards for the guimpe and 2¼ yards for the dress of 32 inch material. Price 10 cents.

**4099. Sleeveless "Cover All" Apron.**—Cut in 4 sizes: Small, 34-36; medium, 38-40; large, 42-44; extra large, 46-48 inches bust measure. A medium size requires 4½ yards of 32 inch material. Price 10 cents.

**3885. Child's Romper Suit.**—Cut in 4 sizes: 2, 4, 6 and 8 years. A 4 year size requires 2⅞ yards of 32 inch material. Price 10 cents.

**PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH**

**HOW TO ORDER PATTERNS**

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cent) stamps for each number. In order to furnish our readers with the very best NEW YORK styles, all patterns ordered are filled in NEW YORK. Do not expect patterns under **Two Weeks** from date of order.

**CATALOGUE NOTICE**

Send 12c in silver or stamps for our Up To Date Fall and Winter 1922 Catalogue. This is even better than the Spring and Summer number. It will have 8 colored plates,, the same as the last catalogue, but a great many of the other pages will be arranged in plate form, so that the Fall and Winter Catalogue will be more like a fashion book than a pattern catalogue.. It will also include points for the needle and hints for the home dressmaker.

**PATTERN DEPARTMENT**
**California Cultivator Los Angeles**

moving fat. Cut in small pieces. Melt in saucepan 1½ tablespoons butter, and 1½ tablespoons chopped onions, 1 clove, garlic and brown slightly. Put in kidneys and brown about 5 minutes. Add one cup water, 1 cup tomato, ½ teaspoon salt, little paprika. Stir well several times and let boil 30 to 35 minutes then put in 2 tablespoons chopped green pepper, 1 tablespoon lemon juice. Serve on large platter with boiled rice around it.

### Watermelon Marmalade and Preserves

Noting request for ways of preserving watermelon in Cultivator of August 26 a reader sends in these recipes:

Watermelon Marmalade—Heart of 1 large ripe watermelon, cut into small squares, minus seeds and strings. Allow 2 lemons and ¾ pound sugar to each pound fruit. Cut lemons in slices and cook sugar, fruit and lemon together until syrup thickens. Crystallized ginger and walnuts added before removing from fire changes this into conserve.

Watermelon Meat Preserves—To 1 pound fruit use ¾ pound sugar. Select melons not too ripe and use only the heart. Take fruit and half of sugar and set over slow fire until fruit is saturated with sugar. Remove fruit and set in sun. Add other half of sugar to the syrup in the kettle and cook till a thick syrup. Put in fruit and allow to come to slow boil. Remove and put in jar. Cook syrup a few minutes longer and then pour over the fruit.

### The Last Fierce Charge

Mrs. John A. Gibson of Ukiah sends words to "The Last Fierce Charge." This she suggests may be poem requested by Elverta subscriber in recent Cultivator.

THE LAST FIERCE CHARGE

'Twas just before the last fierce charge,
Two soldiers drew their rein,
With a parting look and a shake of hands,
They ne'er might meet again.
One had blue eyes and curly hair—
Nineteen but a month ago,
He had red on his cheek, and down on his chin,
He was only a boy, you know.

The other was tall, dark, stern, and proud,
Whose faith in life was dim,
They only trusted the more to him,
He was all the world to them.
They had ridden together on many a raid,
And marched for many a mile,
And now together once more they meet,
With a calm and hopeful smile.

Just then they faced each other,
With a fearful ghastly gloom,
The tall dark man was the first to speak,
"Say, Charlie, my hour has come,
Together we'll ride up yonder hill,
And if you ride back alone—
You will promise to me little trouble to bring,
When you find that I am gone.

I have a fair face on my breast,
I will wear it into the fight—
With a sunny curl, and a bright blue eye,
It's like the morning light.
And I tell you, boy, it's dear to me,
It gladdens a lonely life,
But little she thought of the form of death,
When she promised to be my wife.

Write to her, Charlie, when I am gone,
Send back that fair fond face—
Tell her gently where I died,
And where's my resting place.
Tell her my soul will wait for her,
In the border land between
Heaven and earth until she comes,
It will not be long—it seems."

Tears dimmed the eyes of the blue-eyed boy,
And his heart was low with pain,
I will do your bidding, comrade, dear,
If I return again, but if I should fall
And you should return,
You will do the same for me,
For I have a mother that's waiting at home—
Write to her tenderly.

My mother she lost them one and all,
Her husband and her sons,
And now my country has called on me,
She kissed me and cheered me on.
She is waiting at home like a weeping saint,
Her face all covered with woe,
Her heart will break when I am gone,
I will see her soon I know.

Just then the order was given to march,
For an instant, hand touched hand,
Answered they, and on they rushed,
That brave and gallant band.
They rode till they came to the crest of the hill,
Where the enemy's shot and shell
Poured drifts of death among their ranks,
And jeered them as they fell.

Just then they turned with a horrible yell,
For the heights they could not gain—
And all that doom and death has spared,
Marched slowly back again.
But among the dead that was left behind,
Was the boy with the curly hair,

TO write today for your free copy of this big Golden Jubilee Catalogue will mean a saving of many dollars to YOU this Fall.

It answers every question about price, establishes for you the right price to pay for everything you buy.

Fifty years' experience in manufacturing—in right buying—has gone into this book. Fifty years' experience in low price making is here at your service.

Write for this Catalogue. Know the right price to pay for everything you buy. Take advantage of the many big bargains it offers—the many, many things offered at less than market prices.

This advertisement is printed to tell you of the saving this book offers you, and to tell you that one copy of this Catalogue is yours—FREE. You need merely write us a postal, or fill in the coupon below, and one copy of our big Golden Jubilee Catalogue will be mailed you FREE.

TO THE WOMAN: This free Catalogue offers you the newest styles, selected by our own Fashion Experts. And all the usual extra "style profit" has been eliminated from our prices.

It offers you everything for the home at a big saving: Rugs, Carpets, Curtains, Furniture, Home Furnishings of all kinds of standard quality at money saving prices

TO THE MAN: Think of an all wool—virgin wool suit for less than $15.00. This is an example of our Golden Jubilee Bargains. Everything a man needs, to wear or to use, is offered at prices that mean many dollars saved

FOR THE FARM: For fifty years the American Farmer and Montgomery Ward & Co. have helped each other. This book outdoes all our past achievement in making low prices for you.

Fencing, roofing, tools, paint, hardware—everything the farmer needs is offered at a saving.

**Your Orders Shipped Within 48 Hours**

We announce a new perfected service for you.

After a year's work and study, originating and testing new systems, and employing experts, we have perfected a new system that makes certain a very quick and satisfactory service to you.

Practically every order that comes to Montgomery Ward & Co. this season will actually be shipped and on its way to you in less than 48 hours.

Lower prices, better merchandise, and now a new service. True it is indeed that: "Montgomery Ward & Co., the oldest Mail Order House, is Today the Most Progressive."

MONTGOMERY WARD & CO.
Chicago Kansas City Saint Paul Fort Worth Portland, Ore.

To MONTGOMERY WARD & CO., Dept 38-H
Chicago, Kansas City, Saint Paul, Fort Worth, Portland, Ore.
(*Mail this coupon to the house nearest you*)

Please mail me my free copy of Montgomery Ward's Golden Jubilee Catalogue.

Name .....

Address .....

And the stern, dark man that rode by his side,
Lay dead beside him there.

There is no one to write to that blue-eyed girl
Those fond words her lover said,
Or the mother at home that's waiting her son,
Little knows that he is dead,
And little they know of the last kind words,
Those words to soften their pain,
Until they cross the dark river of death,
And stand by their sides again.

### Good Cooked Frosting

Here is the best frosting recipe I have ever tried:

Put 1 cup sugar and ½ cup water in saucepan, stir until dissolved, bring to boiling point and wash down sides of saucepan with a piece of cheesecloth or a pastry brush dipped in cold water. Beat 1 egg white until light, add slowly a spoonful of the boiling syrup, beating constantly. Slowly add three more tablespoons of the syrup and continue beating, allowing the syrup that remains in the saucepan to boil until it spins a long thread. To make this test, remove saucepan from the fire, dip a spoon in syrup, being careful not to stir it, lift it from the syrup and allow syrup to drop slowly from the spoon. If a thread is formed ten or twelve inches long the syrup is cooked sufficiently and should be removed from the fire. If it does not spin a thread it should be returned to the fire and frequently tested until the right consistency is reached. With a thermometer the temperature should rgister 240 degrees Fahrenheit. When syrup is ready it should be added in a fine, steady stream to the egg mixture while beating, and then ½ teaspoon vanilla or other flavoring as preferred may be added. The frosting should be beaten constantly until almost stiff enough to hold its shape. It is more easily made by two people than by one alone. If, when cool, frosting is too thin to spread, the dish containing it may be placed over hot water. Fold frosting gently over and over until it becomes stiff enough to hold its shape or begins to get sugary on the sides of the bowl. Then pour on the cake, smoothing with back of spoon or leaving rough.

## HOUSEHOLD QUERIES

### "Cowboy's Prayer"

Will you please publish Badger Clark's "Cowboy's Prayer" in the Cultivator? Can you tell us where this was published recently?—Subscriber, Santa Paula.

The "Cowboy's Prayer" possibly identical with "The Dying Cowboy," "The Cowboy's Lament," etc., was published in several versions on Pages 328 and 329 of the California Cultivator of March 25, 1922, copy of which is mailed the Santa Paula subscriber. Many of these cowboy songs and verses have been collected by Prof. John A. Lomax of the University of Texas and published under the title "Camp Fire and Trail Ballads" by Sturgis and Walton Co. Prof. Lomax during this year's summer session at our state university at Berkeley lectured on Cowboy Songs, Cowboy Verse and Negro Spirituals as was noted on Page 11 of the Cultivator of July 1.

### Green Tomato Mincemeat

I haven't seen in the Cultivator a recipe for green tomato mincemeat. Would it be asking too much to make such a request?—Subscriber, Montebello.

Six dozen medium size tomatoes chopped medium fine. Let stand a few hours, draw off juice and add as much water as juice, add 5 pounds light brown sugar (or half brown and half white if preferred), 2 pounds chopped raisins. Cook all slowly until tender. Add 2 tablespoons each of cinnamon, salt, cloves and allspice, 1 cup vinegar and boil until thick. Stir constantly. Lastly pare 6 large sour apples, core and chop, cook and when done add to the first part and mix thoroughly, then seal while hot in glass jars. This is nice mince meat and can be used for fruit cake, plum pudding and pies. Add butter if used for pies. Will keep indefinitely. When opening jars for use one can add more apples and raisins if desired.

### Quince Honey

Will you kindly print directions for making quince honey?—Subscriber, Windsor.

Make a syrup of 3 pounds granulated sugar and 1 pint water. Grate or put through food chopper 3 large quinces and stir them into the boiling syrup. Let boil 15 minutes. Pour into jelly glasses. This will make 7 glasses of delicious honey.

Another: Boil 10 cups sugar and 3 cups water together. Pare 4 large quinces, and grate. Skim the syrup, add the quinces and boil 10 minutes. Bottle and seal. This is very good and is very much like real honey.

### Good Meat Substitutes

Will you please print some good meat substitutes for this hot weather? —Subscriber, Riverside.

Egg and Potato Dish—In a baking dish arrange alternate layers of cold potatoes and hard cooked eggs cut in quarter inch slices. Sprinkle with salt and pepper and nearly cover with white sauce. Grated cheese may be sprinkled over each layer. Cover with toasted crumbs and bake until thoroughly heated.

Pea or Bean Souffle—One cup of pea or bean pulp, one-third cup bread crumbs, one-eighth teaspoon pepper,, 3 eggs, white sauce (½ cup milk), ½ teaspoon salt. Make sauce, add crumbs, pulp and beaten yolks. Fold in beaten whites. Bake until firm in a moderate oven.

Scalloped Olives and Potatoes

Three tablespoons butter or bacon fat, 3 tablespoons flour, 1½ cups milk, ½ cup chopped cheese, 4 cups cold diced potatoes, ½ cup chopped green pepper, ½ cup minced ripe olives, ¼ cup buttered bread crumbs, seasonings.

Melt fat in saucepan, add flour and stir until smooth. Add milk gradually, stirring constantly. When thickened add cheese and seasonings. Cook slowly until cheese is melted. Put a layer of potatoes into a buttered baking dish, then a layer of peppers and olives. Repeat. Pour the sauce over the top, cover with buttered crumbs and bake in a moderate oven 20 minutes.

Scalloped Olives and Potatoes

Two cups canned corn, 2 cups finely diced celery, ½ cup minced ripe olives, ½ cup milk, ¼ cup buttered bread crumbs, 2 tablespoons butter, 1 teaspoon salt, ½ teaspoon pepper.

Put the corn, cooked celery and olives in alternate layers into a buttered baking dish. Add seasonings, butter and milk. Cover with buttered crumbs and bake in a moderate oven 30 minutes.

Mock Oysters

One cup chopped nut meats, 1 cup boiled rice, 4 parsnips, 4 tablespoons flour, 2 eggs, 1 teaspoon salt.

Boil parsnips until tender; force through a coarse sieve and add the well beaten eggs. Mix nut meats, rice and seasonings. Combine the two mixtures. Drop by tablespoons in hot olive oil and saute until brown. Serve with ripe olive and tomato sauce.

### A BIFURCATED HONEYMOON

"Honey," said the colored suitor, "when we gits married you ain't gwine to give up dat good job you has workin' for de white folks, is you?"

"But ain't we gwine to have no honeymoon an' take a trip on de train somewhere?"

"One of us might go, honey. Dey ain't a thing holdin' me, but you's go 'sponsibilities." — Birmingham Age-Herald.

### HOUSE RATS AND MICE

The California department of agriculture calls attention to the following authoritative summary of rodent damage in the United States.

"House rats, the most destructive mammal pest in the world, each year destroy food and other products in field, granary, warehouse, store and home to the extent of more than $200,000,000, a sum equalling the economic output of 200,000 men working continuously. In addition to destruction of food products, poultry and other agricultural property, these pests are carriers of bubonic and pneumonic plague and other diseases communicable to man, and carriers of trichinosis, a parasite of swine; and since rats and mice may contract avian tuberculosis, both may have an influence on the spread of this infectious disease among domestic poultry." Information on approved methods of rat and mouse extermination may be had by addressing the Bureau of Pest Control, California Department of Agriculture, Sacramento.

### "STOP RAPIDLY"

W. D. Ashbaugh of Bucyrus, Ohio, has received from his brother now in Tokio, Japan, a card of rules governing automobile traffic in Japan. The card says:

"At the rise of the hand of policeman, stop rapidly. Do not pass him by or otherwise dirupt him.

"When a passenger of the foot hove in sight, tootle the horn trumpet to him melodiously at first. If he still obstacles your passage, tootle him with vigor and express by word of mouth the warning, 'Hi! Hi!'

"Beware of the wandering horse that he shall not take fright as you pass him. Do not explode the exhaust at him. Go soothingly by, or stop by the roadside till he pass away.

"Go soothing on the grease-mud, as there lurks the skid demon. Press the break of the foot as you roll round the corners to save the collapse and tieup."

### CAUSE OF RIMING

"If you're waking call me early; call me early, mother dear."
A request like that from daughter seemed so strange, unique and queer
That a poet, overhearing, wrote a long, sonorous rime
That'll thunder down the ages till the very end of time.
—Country Gentleman.

Maybe that hill is not there, after all—

VERY often the hill we seem to be climbing is made out of the common mistakes of diet which starve tissues and nerves and slow down energies.

How smooth and level the path seemed to be when we were younger.

Simple, natural food may level that hill to a smooth path again.

Why not try it?

Begin today with a dish of Grape-Nuts with cream or milk—and fresh or preserved fruit added if you like.

Keep on with this crisp, delicious, strengthening food in place of heavy, ill-assorted, starchy breakfasts and lunches—and see if the old-time zest and speed on the old-time level path doesn't come back again.

Grape-Nuts —THE BODY BUILDER

*"There's a Reason"*

New Lamp Burns 94% Air
Beats Electric or Gas

A new oil lamp that gives an amazingly brilliant, soft, white light, even better than gas or electricity, has been tested by the U. S. Government and 35 leading universities and found to be superior to 10 ordinary oil lamps. It burns without odor, smoke or noise—no pumping up, is simple, clean, safe. Burns 94% air and 6% common kerosene (coal-oil).

The inventor, W. V. Johnson, 31 N. Fifth St., Portland, Ore., is offering to send a a lamp on 10 days' FREE trial, or even to give one FREE to the first user in each locality who will help him introduce it. Write him today for full particulars. Also ask him to explain how you can get the agency, and without experience or money make $250 to $500 per month.

*Leader Water Systems*
*are entirely automatic*

City convenience—water under pressure at all times and automatically regulated. Relieves the burden of the old system and is thoroughly dependable. Can be installed with gasoline engine with automatic stop only.

# Comparative Prosperity of the California Farmer

By A. L. Spellmeyer

CENTRALIZATION has been carried to an extreme in the East and Middle West, and decentralization is comparatively prevalent in California production. The comparatively great prosperity of the California farmer, stockman, rancher and business man at this time of depression must have a cause. That cause is not explained by saying that a great multitude of people are rushing to California and therefore make prosperity. Rather, the people are coming here in multitudes because we are prosperous in comparison to other districts.

We have our small men, our narrow minded swinish profiteers, and our selfish manipulators, but there are few men among our worst that refuse to accept and back some project for the general good of the state or locality. Our banks only a few years ago were generally accused of being pawnbrokers and "small town," but in a few years our local banking methods have broadened, and today vital basic problems such as livestock and farm financing are being gingerly probed and sampled by our bankers as a prelude to a general constructive effort of help in a large way. This alone acclaims that our California banks have reached a growth and cosmopolitan stage and may outstrip any known financial policy in the end.

In our comparative western prosperity in California we must give due credit to the general cooperative and progressive tendency of our producers and the great established fruit industries, such as the citrus, raisin, walnut and others which have taught us that lesson and taught our banks and our middle marketers that in these organized industries they can go so far and no farther. It has brought home a further lesson of restraint in all attempts at a middle market control, for the surest thing here in California to force organization is to sand bag and milk some special line of production, for if so mistreated cooperative organization is certain to develop.

As to decentralization, it is general in California even though our cities are growing at a remarkable rate.

The citrus people do not operate a great central plant, but hundreds of local packing houses in the fruit districts. The raisin people put their factories in the heart of the fruit districts instead of in the heart of the cities. This is further shown in the scattered meat killing industry, in cotton ginning, etc. Our distances here have to some extent prevented centralization. Our factories are spread out in various lines over a whole state, not in a few congested districts. Cement is made in country plants, meat is killed and marketed in San Diego, San Bernardino, Ramona and Anaheim, and country districts throughout the state. Tractors are made in Stockton, matches in Chico, and our scattered manufacture is through the length of the long state of this Union.

Even our banks have reached out in many branches, furnishing a grasp of possible money volume that can only be furnished by great city banks, while country districts and country products. This scattering of effort, in our midst, oil production and manufacturing is already existing as fact in California, and that may explain our comparative prosperity.

With the wonderful advantages we have, all is not perfect, and we cannot lie down, we must continue the effort to further the comparative freedom that producing industry has here. In Southern California at the presnt time the main effort is concentrated upon stimulating the Southwest livestock industry, for that has been the best organized and protected of all the producing industries, the hardest hit and it has been shown to be the direct cause of much loss to our ordinary small farmer. The entire state must not concentrate on fruit or raisins or cotton, and with the great growing world demand it has become necessary to stimulate livestock production for our needs, for general small farm existence and for by-product manufacturing.

Methods that some of our local middle marketers of meat attempt, are pirateering, but our worst are not as bad as some of the best in the more centralized states, as to applied methods towards livestock production. The very fact that a sensitive spot exists in the hides of some of these local killers as to what is fair to producers shows there is a hope for reform. The behemoth of ancient days has a paper thin hide as campared to some of the Eastern manipulators of the business.

About 30 miles south of Los Angeles is a killing firm that operates some 42 shops successfully, and there is a lesson in this success for every rancher or farmer at California that must depend partially upon livestock price for income return (and this when it is broadly considered means most of agricultural effort of this state,) in shortening the road between producer and consumer.

I remember this firm killing its picked-up few head at a local packing house on commission. Later it put in a little killing plant near Los Angeles as the business was getting too much for the packing house to like it and cost too much to do the work for the owner to like it. The business branched out and a greater abattoir resulted in that place 30 miles from the city, but there was a lot of competition and the road became rather rough. Then the owner, now older, bought a few retail shops, and then a few more, and now he is riding easily, and doing well, with a stable kill volume and a string of shops.

Professor Christie of Purdue University, of Indiana, recently visited us and called our attention to certain needed reforms in methods and marketing of Western livestock. It takes a stranger to size things up, and we could in many ways here in California return the excellent criticism of Professor Christie, with a possible criticism of Indiana as made by a party who just returned from a visit to the Lafayette district.

We are told that eggs are 15 cents a dozen there now, oats 24 cents a bushel and corn, 39c. Stacks of hay are abundant and money is scarce. A particular lot of weanling Shorthorn calves was offered for sale a few weeks ago and they were good one, 400 pounds and in fine shape, and the best offer drawn for them was $10 per head.

As this Indiana visitor stated on his return this week, the people in California don't even know what hard times are for those Indiana folks who bought farms on time have to let them go, and the man is fortunate who can pay his taxes. He states on many farms the peak of accomplishment is to be able to gather from any possible sources enough money to meet the taxes and maintain existence, right now.

Comparatively therefore, California is far better off than Indiana, and if Purdue University will assimilate through Professor Christie the lesson in California cooperative food organization among producers, Indiana will benefit, and if we absorb reforms in raising and marketing livestock that Professor Christie advocates, we will likewise benefit.

You can write Montana and Wyoming for an appraisal on some property there and you get the answer that it's worth $30,000 or some specific sum, but we couldn't loan anything on it as we haven't any money up here. You can hear men say there is not a single cowman in New Mexico who has not been very badly injured in his finances. A bank examiner from Texas is reported to have taken a vacation rather than keep looking into the old story of farm and livestock troubles, but plenty of rain and no boll weevil will change the Texas condition rapidly.

Comparatively California is prosperous, and we cannot look into the future with any dire forebodings. We have good reason to hope for an increase of prosperity in our livestock production and general farming. Many of the Eastern storms pass us by, and the fact this state enjoys a great growth and healthy activity is because a part of our production actually receives the profit it earns, and the rest of our production has a hope of soon participating.

---

A sharp answer turneth away business.

# Livestock News Notes

## LIVESTOCK SALE CALENDAR

**Holsteins**

September 21, Dispersal, E. Maracini, Dos Palos.

September 28, Dispersal, Carl Ray, Lankershim.

October 26,, Draft C. W. Anderson, Burbank.

November 16, Dispersal, Arthur & Maxfield Holstein Co., Hanford.

---

Leda Pietertje Spofford Walker, owned by Charles Harrington, Compton, has completed a record of 887.96 pounds butter from 18,132.2 pounds milk in 365 days. She is sired by Prince Riverside Walker, the great old proven son of Aaggie Acme of Riverside, owned by W. J. Higdon. This record was made as a senior three year old.

---

At the present time there are sixty-nine cows of all breeds in California that have made 305 or 365 day records above 800 pounds of butterfat. Of these sixty-seven are registered Holsteins. One cow of each of two other breeds has made over 800 pounds of butterfat in one year. Three first calf registered heifers in California have each made over 800 pounds butterfat in one year.

---

Chas. E. Walker, the Tucson banker who has been active in war finance loans, was in Monday and reports Southern Arizona has both good grass and good feeder cattle, but few beef steers in the entire district.

---

During the absence of President Le Baron Vice-President Wing is acting as head of the club. He has appointed F. E. Howard of Santa Rosa, head of the bureau of educational work, which will arrange for the showing of Ayrshire films and stereopticon slides throughout California. Any farm bureau center, agricultural club or class may obtain the films without charge by writing Mr. Howard. In order to save time and transportation charges the films will be routed.

---

The Ayrshires formerly owned by A. D. Silver, Atlas Way Route, Napa, have been purchased by Arnold Cremonini of the same address.

---

E. Wyndham of Redding had the state leader for the month of April, 1922, in his cow Tanglewood Queen 4th, with a production of 1,477.7 pounds milk, 58.22 pounds fat.

---

## CALIFORNIA AYRSHIRE RECORDS

| | | Milk, lbs. | Fat, lbs. |
|---|---|---|---|
| Lucy of Elkhorn. | 2-2-1/2 | 12,025 | 544.48 |

| Willowmoor Jean Douglas 1st .... | 3-1/2-4 | 6,860 | 241.67 |
| Willowmoor Jean 7th ..... | 3-3-1/2 | 11,752 | 483.37 |
| Elkhorn Kirsty .. | 2-1/2-3 | 11,035 | 545.17 |

These are the leaders in the various classes of the advanced registry for California. Mr. Breeder, do your cows have authenticated records? If not, why not find out what they will do by putting them on official test? None of our records are as high for the different classes as they should be. Let's find out what every registered Ayrshire cow in California can do in the way of production. There is no reason why the records for the breed should not come to the Pacific Coast the same as the records for other breeds have. There is going to be a demand this fall for Ayrshire bulls out of dams with advanced registry records of 400 pounds butterfat or better. These records must be verified. If you have such bulls for sale, please list them with the Secretary, California Ayrshire Club, La Honda.

**Better than Whitewash**

CARBOLA
The Disinfecting White Paint

Carbola is both paint and powerful disinfectant in one. Much easier to apply, gives better results and costs less than whitewash and disinfectants. Just mix Carbola powder with water and it's ready to use. No waiting or straining. Does not spoil if left standing in pail. Does not clog sprayer. *Does not peel or flake.* Powerful disinfectant keeps its strength on wall. Used, with brush or sprayer, by thousands of dairy and poultry farms.

Your hardware, paint, seed or drug dealer has Carbola, or can get it. If not, order direct.

LISLE MFG. COMPANY
Box 716 Clarinda, Iowa

# San Joaquin County Fair

By Jack Klein

THE third fair at Stockton, under the management of the new and wide-awake board far surpasses anything that has ever been attempted in that county before. San Joaquin County has spent a lot of money equipping its fair grounds, and the buildings are by far the best in the state. The big agricultural and horticultural building is crowded and the new poultry building is barely sufficient to house the exhibits. The livestock barns are overflowing into temporary quarters between them.

Great interest is being taken in the fair, and from an attendance standpoint it ranks with district rather than with county shows.

The big exhibit of tractors and farm fachinery is the mecca of a great many visitors from this fertile section, which is on the verge of another great year of fruit and grape harvest.

Being close to Sacramento and just before the big fair there, the Stockton show has drawn a number of herds of the different breeds from as far south as Los Angeles.

In the dairy breeds it is a close race between the Holsteins and Jerseys as far as numbers go. The Polands are of course most numerous of the hogs. A considerable number of sheepmen are present with representative flocks, and the competition has been close in a number of breeds.

The Berkshire hogs are represented only by the fine show herd from A. B. Humphrey's Grape Wild Farm at Escalon. Many well known individuals are in the herd, but the boar, Escalon Big Joe, was too good to be headed for senior and grand champion. Grapewild Leader 15 was junior. In the sows Escalon Artful Princess was senior and grand champion, with Escalon Royal Lady 13, junior.

Honors in the Durocs were divided between the Western Laboratories of Stockton and Jim Thorp of Lockeford. Thorp won all the championships.

Hayes and Harter of Grants Pass, Oregon, showed the only Hampshires, and Dr. Summerfield's Tamworths were the lone herd.

In the Polands the two big herds shown by A. Buckland & Son of Fresno and the Tagus Ranch of Tulare, fought a battle royal with the herd of Beckman & Sons of Lodi cutting in occasionally. Giant Prospect, shown by Buckland, was senior and grand champion boar, and the Tagus Ranch showed an unnamed boar for junior. Willows Lady, a senior yearling, won the senior and grand championship for Tagus and Miss Orange Bob 6 from the same herd was junior.

In the fat barrow classes Western Laboratory was first, Humphrey, second, and Summerfield third in pens. Tagus won champion barrow.

The hogs were judged by E. L. Potter, of the Oregon agricultural college.

Fred Wilson, of Reno, Nevada, judged sheep.

Judge H. A. Lindgren, also of O. A. C., was confronted by large classes in the dairy breeds, but was generally satisfactory in his placing.

The Le Baron herd of Ayrshires from Valley Ford and the herd from the H. G. ranch in Santa Barbara County, were both large ones, and a dozen aged cows faced the judge. The H. G. animals were of excellent type and well fitted and shown, so were usually victorious. The Gantz ranch took all championships.

The Guernsey herd from the Humphrey ranch was alone and competition was between the animals of the herd. Nobleman of Maple Hill, looking better than ever, repeated his former success. Mayhew's Bonnie Lass was senior and grand champion cow.

The Jersey showing was a battle with four herds competing. Waterloo Jersey Farm won junior and grand champion cow with Violets Grace Derriem of L. and Junior with Financial Countess Foxalo, Romulus Interest, belonging to W. J. Hackett, was senior and grand champion bull and Thorp's Biddy's King of Mossdale was junior. Tom Harrison had the Dairy Shorthorn showing all to himself.

About 90 per cent of the Holstein ribbons went to the South, being split up between the show herds from the Hartsook and Berylwood ranches. They were opposed by R. M. Stevens of Modesto, Salfield & Biggs of Escalon, and Edwards Brothers of Escalon, but without avail.

The great young bull, Prince Aaggie of Berylwood, who is by the way, backed up by the highest average yearly records for his seven nearest dams of any bull in service in the world, was junior and grand champion, beating some wonderful bulls for the honors. Major Korndyke Pontiac Fobes, owned by Hartsook, was senior champion.

Hartsook's cow, Ava Model Hengerveld, was senior and grand champion, and his junior yearling, Lily Tirtomia Pietertje Ormsby, was junior champion.

The awards in the Holstein's were:

Aged Bulls—1, Hartsook on Major Korndyke Pontiac Fobes; 2, Edwards on Sir Toyon Model Hartog.

Senior Yearling—1, Berylwood on Prince Aaggie of Berylwood; 2, Berylwood Fobes Korndyke; 3, Edwards on Prince Aralia Ignaro Walker.

Junior Calf—Hartsook on unnamed calf; 2, Hartsook on Meadhart Aaggie Mead 7; 3, Hartsook on Meadhart Aaggie Mead 6; 4 Salfield & Biggs on Live Oak Alcartra Pontiac.

Aged Cow—1, Hartsook on Ava Model Hengerveld; 2, Berylwood on Korndyke Canary Bightest; 3, Hartsook, Colantha Creamelle Illa Korndyke; 4, Berylwood Fay Tritomia Hengerveld Walker.

Two year old—1, Hartsook Wadnah Ormsby Skylark; 2 and 3, Berylwood Holland Pietertje Fobes and Lida De Kol Ormsby Hartog; 4, Edwards Gladys Nudine Hengerveld.

Senior yearling—1 and 2, Hartsook Cornucopia Paul Segis Fayne and Ragapple Tritomia Ormsby Segis; 3 and 4, Berylwood De Kol Sunshine Creamelle and De Kol Creamelle Sunshine.

Junior yearlings—1, Hartsook, Lily Tritomia Pietertje Ormsby; 2, Baird Snodgrass Pearl Aaggie Hengerveld Segis; 3, Hartsook Caroline Wayne Fayne; 4, Edwards Detry Hengerveld Hartog.

Senior Calf—1, Berylwood Miss Aero Osuma; 2 and 3, Hartsook Meadhart Mary and Meadhart Pietje; 4, Berylwood Lady Ononis Segis.

Junior calf—1, 2, Hartsook Jacoba Pontiac, Meadhart Eva Bona; 3, Berylwood Pieba of Berylwood; 4, Hartsook Meadhart Tuebic Segis.

Aged herd—1, Hartsook; 2, Edwards.

Young herd—1, Hartsook.

Calf herd—1, 2, Hartsook; 3, Edwards; 4, Salfield & Biggs.

Get of Sire—1, Hartsook, Get of Tritomia Pietertje Ormsby; 2, Berylwood, Get of Pearl King Segis Pontiac; 3, Hartsook, Get of Hazlewood Finderne Fayne; 4, Edwards, Get of Model Korndyke De Kol Hartog.

Produce of Dam—1, Hartsook, Produce of K. S. and Lily McKinley; 2-3, Berylwood, Produce of Fay Tritomia Hengerveld Walker and Miss Bracelet Fobes Korndyke; 4, Edwards, Produce of Gladys Nudine Hengerveld.

Book Review

## BUTTER MAKING

"Principles and Practice of Buttermaking" by G. L. McKay, Dr. S. C., formerly professor of dairying state college, Iowa, and C. Larsen, M. S. A., professor dairy husbandry, South Dakota, published by John Wiley and Sons, New York, $3 post paid.

"The art of butter-making in some form dates back to time immemorial. History tells us that butter is one of the oldest, as well as one of the most universal, articles of diet. We are told it was used in some form two thousand years before the birth of Christ. References are made to it in early Biblical and other ancient history. We read, in Genesis, that when Abraham was visited by Angels, who appeared in the form of men, 'he took butter and milk and the calf which he had dressed and set it before them.' The word 'butter' is mentioned in the Bible seven times. It is known that the Scythians and Greeks used butter in 450 B. C." are the opening words of the first chapter. A number of other most interesting facts as to history of buttermaking are given. There then follow 25 chapters and appendix touching upon composition of milk and its various properties, milk secretion, milk and its products, ferments, variation, commercial handling of milk, composite samples, creamery calculation, separation, farm separators, neutralization and pasteurization, cream ripening and starters, churning and washing, salting and working, preparing for market, composition of butter defects, judging and grading, cold storage, cooling facilities and economic operation of creameries. There are over 400 pages in the book printed on excellent paper. It has many illustrations and is a book which every butter maker should have in his library. The information contained in the book is made available by a most complete index covering nearly a dozen pages.

Cattle were the first money. The Roman word for money, pecuniam, is derived from pecus, meaning cattle.—Wells' Outline of History.

## ACCURATE LIVESTOCK REPORTS PLANNED

It pays to kick, sometimes, as livestock men are finding out, and we can conclude that the recipient of many kicks in the last few years, Leon M. Estabrook of the department of agriculture, is a well intentioned party. E. E. Kauffman of California isn't so slow in statistical governmental work himself, and such men as Alonzo Egbert Taylor and other noted economists happen to reside in sunny California. Mr. Estabrook and Mr. Kauffman had recognized the limitation of the government guess methods and lack of classification in livestock numbers, and Mr. Kauffman's census and work since 1920 has shown a considerable ability in attempting more accurate reports for this state.

Now Mr. Estabrook is associate chief of the new department at Washington, the bureau of agricultural economics, and has a working plan for reporting livestock numbers by age and class, together with full and general estimates of range conditions, calf crops, movements, etc. of livestock. It is most comprehensive, and if the work equals the promise, and congress allows the appropriation, we will see arrive a state of general knowledge of livestock prices and conditions, providing that contemplated service is "speeded up" to be effective. In some respects it will not avail if it gets musty before being sent out, as price information is wanted at once, before the condition changes, if it is to accomplish any beneficial result to producers.

This is a very good time for the Southwestern men to intimate to the congressmen soliciting their support and vote a pledge to help this market information service. After these men get in they may not pay as much attention as before they get in, and it is quite a pertinent matter for the Southwestern livestock producer to have this general information as to supply and demand.—A. L. Spellmeyer.

## CATTLE IN DEMAND

From various districts come the details of specific sales, contracts or offerings on cattle and sheep. In the offerings the general rule is a half to one-fourth in numbers of the steers that were offered from those same districts ten years ago. I notice this now for formerly I had bought out some of these districts on orders and have old records of numbers that show a great number depreciation in this fall's offerings. The St. George steers haven't sold yet; the Kingman district is not thoroughly cleaned up and southern Arizona is offering some grass fat fall medium steers on basis of $6.50 per cwt. delivered to Los Angeles. With the Inyo cattle and other Utah and Nevada districts, it may be realized there are uncertainties in the situation that rather depress feeder buying activity here.

There is also a lack of finance, for many people want cattle in Imperial and elsewhere, who haven't the money, and they are offering to trade bank stock, lands and improved property for cattle in a number of instances, to my positive knowledge.

There is some talk of the war finance functioning further, and Director Meyers recently is reported to have addressed the American National Livestock Association on the subject with the result that a committee from that body has been appointed to confer. A few weeks ago there was a war finance loan refused upon a southern Arizona outfit for an amount equivalent to the bank debts and just one-quarter of what the identical outfit was held at for sale in 1919 and half of its present asked price. The ways of the mighty are difficult to understand. If the loan is good now for the banks it ought to be good for the war finance with the banks backing, as is necessary. Also the year is fine and grass is good in Arizona.

The Arizona prices continue to average about $25 for yearling steers, $35 for twos and $45 for good 900 pound threes, or 5 cents by weight, f. o. b.—A. L. S.

# Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

### Quality of Milk

To what extent is the quality of a cow's milk affected by delay in having the cow come in fresh? If a cow has not come fresh for over a year is it as wholesome for a baby?—Subscriber, El Cajon.

Milk from a fresh cow or one that has not been giving milk for more than six or eight months after coming fresh is considered best for a baby although there is no good reason why the milk from a good healthy cow should not be good even after a longer period. The quality of the milk depends somewhat on the feed. It should be neither too rich nor too poor but should consist of some green feed or roots if possible. All feed should be free from mould or decay as that will affect the milk.

### Hog Cholera

Have some young hogs that have a good appetite but cough and get white matter in the corners of the eyes. They keep getting weaker and die. What is wrong?—Subscriber, Woodland.

Probably it is hog cholera. Better consult a veterinarian nearby or write the state board of agriculture at Berkeley.

### Cow Fails to Breed

What should I do for a cow that fails to breed? She is five years old, a good milker and always in good condition. She is fed alfalfa hay and barley stubble with plenty of alfalfa pasture. It is about a year since she was fresh and we have failed to get her with calf although she comes in heat regularly.—Subscriber, Sisquoc.

Read answer in last issue to similar question. If you fail after trying that write us again.

### Calves Dying

My calves four or five months old are fat and seem healthy. They are fed milk once a day and run on hill pasture. One at a time they get sick and in 24 hours die They get stiff in the joints, swell under the jaws and along the windpipe and breathe hard. What can we do for them?—Subscriber, Ashland, Oregon.

We can not tell what is wrong with the calves. It acts like some kind of poisoning. Better get a veterinarian nearby to look at them.

### Ringbone

I have a mare that got hurt about two months ago at the fetlock joint and swelling was left that does not go away. She is not lame when walking but cannot trot on hard road. Please advise me what to do for it.—Subscriber, Ashland, Oregon.

If it is below the fetlock joint it may be a ringbone but if it is above it is only a strained ligament. In either case tie a bandage loosely around it and soak it with cold water twice a day. After a few days if it is still lame apply a good liniment.

## DAIRYMEN SAVE $10,000 WEEKLY

Cooperative creameries in Minnesota are saving $10,000 every seven days by shipping their products at carlot freight rates through the Minnesota Cooperative Creameries Association, Inc., direct to their New York sales office. Seventy cars of cooperative creamery butter are moving to the eastern market every week under the association marketing plan. These cars carry more than 2,000,000 pounds of butter.

In the near future we will discontinue all official and semi-official testing

WE OFFER

**AT PRIVATE SALE, AT THE FARM**

**Singly or in Groups**
**ANY 50 HEAD of Registered Holstein Cattle in Our Herd**

*You Pick Them Out: We Will Sell Them*

This offer is made without reservation and includes every one of our State Champion and World's Record cows, among them:

KIATTA PONTIAC PRIDE (world's record junior 4 year old for 365 day milk production), 1,134 lbs. butter, 31,491.6 lbs. milk in 365 days. 34.46 lbs. butter, 747.4 lbs. milk in 7 days, and two of her daughters.

IRENE SEGIS PONTIAC, at 4 years, 1,008 lbs. butter, 23,301.7 lbs. milk in 365 days. At 5 years, 33.03 lbs. butter, 76 lbs. milk in 7 days. Now making the largest combined milk and butter record ever made in our herd; has 551 lbs. butter, 14,094.3 lbs. milk in 136 days, averaging over 103 lbs. milk and 4 lbs. butter per day. A sister to Kiatta, both being sired by a son of a 1,470 lb. yearly record cow.

LOIS BERYL PRIDE. California State Champion and fourth highest in the world for seven days milk in the senior 4 year old class. 837.4 lbs. milk, 29.03 lbs. butter in 7 days. She is running in long time test and has to her credit over 500 lbs. butter in 169 days. Another sister to Kiatta.

FANNIE PONTIAC BUTTER GIRL PRIDE, California State Champion for seven day milk production in the junior 4 year old class. 751 lbs. milk in 7 days. She is running sensationally in long time test and has to her credit 20,700 lbs. milk and 720 lbs. butter in 228 days.

SEVERAL SISTERS to the above that have made good seven-day records and have made or are now making year records up to 1,100 lbs. butter.

JOHANNA PRINCESS MOOIE 2d at 3 years, 1,172 lbs. butter, 25,596.5 lbs. milk in 365 days (world's combined milk and butter record when made—still 2d highest in the world for butter). She has two three-year-old daughters with 28.87 lbs. butter and 30.03 lbs. butter in 7 days.
Sisters to Johanna Princess Mooie 2d.

THELMA HARTOG SUNLAND DE KOL 4th. 32.08 lbs. butter, 728 lbs. milk in 7 days. 1,134 lbs. butter, 27,000 lbs. milk in 365 days.

DAUGHTERS AND GRAND-DAUGHTERS of Laurameka, 1,326 lbs. butter, 29,899 lbs. milk in 365 days; ROXIE PAULINE BURKE HENGERVELD, 1,188 lbs. butter, 25,175 lbs. milk in 365 days; JOHANNA PRINCESS MOOIE 2d, 1,172 lbs. butter, 25,596.5 lbs. milk in 365 days; KIATTA PONTIAC PRIDE, 1,134 lbs. butter, 31,491.6 lbs. milk in 365 days; THELMA HARTOG SUNLAND DE KOL 4th, 1,134 lbs. butter, 27,000 lbs. milk in 365 days, and a number of cows now running sensationally in long-time test.

LAST YEAR we made some of the largest records in the United States.
THIS YEAR we are going stronger than ever.
The test strings will be kept in test until sold.

THIS OFFERS A WONDERFUL OPPORTUNITY TO TAKE OVER THE TEST COWS AND COMPLETE SOME OF THE LARGEST RECORDS EVER MADE IN CALIFORNIA.

## QUESTIONS AND ANSWERS

(Continued from Page 267)

glory. I have quite a lot of morning glory and would like to get rid of it.—Subscriber, Calexico.

There are weed killers which have been advertised in the California Cultivator and which are said to do good work. Where one wishes to destroy the weeds chemically the preferable way probably is to use these mixtures. Where one wishes to prepare his own we refer to article on page 738 of the Cultivator of June 4.

### Champagne

I would like to know how to make "champagne wine."—Subscriber.

We believe it is illegal to publish in any paper or to give through the United States mails information as to manufacture of any alcoholic beverages.

### Plaster for Fertilizer

How will old lime plaster do for fertilizer on sandy land?—Subscriber, Nipomo.

We do not think you would derive much benefit from the use of old lime plaster on any soil. There is not a great deal of lime in the plaster, the greater proportion being sand. If you can get the plaster for nothing and only figure the cost of loading and unloading, you might get enough benefit to justify the expense but otherwise we would not think it worth while.

### Peaches Gumming

Would it be possible for you to give me any information about treatment for a peach tree on which the peaches nearly all show an oozing of gum? Is this anything that can be controlled or cured?—Subscriber.

This question is discussed on other pages of this issue as it has been in two or three recent numbers. Gumming has been declared to be an indication of disease or physical condition of a tree rather than a disease itself. However, there is a diversity of opinion. As the question is being discussed so fully by those who have observed it, will refer our subscriber to these articles.

### Explosives for Clearing

On my mountain ranch I have many acres of land to clear of elder, box-elder, sycamore, choke cherry, snowberry and wild rose bushes, also much wild buckwheat. What is the best way to clear? Is powder too expensive to use in getting out the trees? What reading matter could I get on the subject of clearing land?—Subscriber, Long Beach.

Explosives have proved economical and afford a quick method of reducing stumps and big boulders. Would suggest writing to the Department of War, Washington, D. C., and asking as to supply of explosives which the department is closing out at a very small fraction of original cost. In fact, the principal expense will be for freight. In addition write Institute of Makers of Explosives, 103 Park Avenue, New York, for "Use of Explosives for Agricultural Purposes." Also write DuPont Powder Company, Wilmington, Delaware.

### Commercial Fertilizer for Potatoes

C. Henry Smith of San Francisco, writes: "Referring to Springville subscriber's query in California Cultivator of July 29 regarding the use of commercial fertilizers in growing potatoes, would say that nitrate of lime has been used with excellent results in California for a number of years. It carries 13 per cent nitrogen in the most available form and should be applied at a rate of 400 to 500 pounds per acre."

### Irrigating Orange Grove

Orange orchard near Covina froze back severely last January. Dead wood was all removed last spring and it has had fine care. We have been irrigating about every four to five weeks and the trees have grown wonderfully. We expect to irrigate again this week. We usually run the water 24 to 36 hours. Would you recommend giving the orchard the usual amount of water at this time? If not, state number of hours you would water and when you would make last irrigation of the summer preparatory to hardening the trees for the winter. The age of the trees is about 15 years. All of the growth on the trees is this year's. They have grown to about one-half normal tops. This and any other advice you can give me on caring for this orchard to bring it back would be appreciated. State in your next issue the above information. —F. D. K., Pasadena.

Because of this inquirier's request for immediate answer, letter was written him. Then it was noticed that no name was signed to the request, merely initials. Of course, the letter could not be sent, therefore the answer has been inserted in first issue possible of Cultivator. Please observe request at head of query column and sign name and address. These will not be published. It is merely a matter of courtesy to us and convenience to you.

Regarding irrigation (if not too late with this information) we would suggest irrigation at this time just as heavy as usual, but the September irrigation should be much lighter. Of course you cannot estimate just when the rains are going to begin. But if the irrigations of September and later could be so as to simply keep leaves from curling it might lessen the danger from frost injury. On the other hand, we believe trees are at times severely injured by withholding water. It is a matter largely of closely examining your soil conditions. The only thing positive we can say is "Don't dry up the trees too much." If they are forced into dormancy during September and October a warm December rain might start them into such vigorous growth that a cold January might injure them.

# Fourth Farm Bureau Contest

ON THE first of October there will begin in the contest laying house at Santa Cruz the fourth California Farm Bureau Egg Laying Contest. Begun three years ago under the auspices of the poultry division of the college of agriculture of the University of California, this contest has grown to such proportions and won such unqualified support from the poultrymen of California that it bids fair to become a permanent institution.

The objects of the contest, according to the 1923 rules and regulaions, just issued, are:

1. To build up the average egg production of the California hen by stimulating interest in selection and breeding for egg production.

2. To add to our knowledge of the science and art of breeding for egg production by a study of individual productive variations.

3. To afford poultry breeders the opportunity of having their fowls officially tested and of demonstrating the value of their strains for egg production.

4. To acquaint the public with the relative value of these strains.

5. To demonstrate the adaptability of California climates to successful egg farming.

6. To demonstrate the practical value of the experimental work of the poultry division of the state experiment station.

### Contest Rules

Each entry will consist of 12 pure bred pullets of a recognized standard variety, but only ten birds will be considered as in competition, the two additional birds being included to take care of mortality losses during the year.

The sum total of the egg production of the ten highest hens of each entry at any given time will determine the position of that entry in the contest.

If the number of hens in any one entry falls below eight that entry shall thereafter be ineligible to compete for pen prizes.

Outside entries should be shipped to arrive between September 25 and October 1.

Local entries will be notified when to bring in birds.

The entry fee will be $2 per fowl for the one year period.

The management reserves the right to refuse any entry in which the birds show signs of disease, and to kill any birds whose presence because of disease or vice would be detrimental.

No entry may be withdrawn after the birds have been received at the contest grounds.

Legbands and directions for placing them will be sent to each owner when his application is accepted.

All birds will be fed, housed and handled alike under expert supervision. Every attention will be given to sanitation and disease prevention and every normal effort made to secure maximum production. Three entries will be placed in each pen and floor eggs divided equally between the three entries.

All birds will be trapnested. Exceedingly malformed eggs, soft-shelled eggs and eggs weighing less than 18 ounces to the dozen will not be counted nor credited to the bird.

All eggs produced will become the property of the contest.

Ribbons will be awarded monthly to the three highest pens and to the highest laying hen for that month. Handsomely engraved loving cups will be awarded to the first, second and third high pens and first, second and third high hens at the close of the contest.

### 1922 Ration

The contest ration for the year just closing is as follows: Scratch grain in morning: 80 pounds plump, recleaned barley; 120 pounds plump, whole wheat; 200 pounds clean, cracked yellow corn. Nutritive ratio, 1:7.9.

Scratch grain in evening: 200 pounds sprouted barley (fed very dry).

Two hundred pounds morning scratch mixture. Nutritive ratio, 1:7.8. Dry mash in hoppers all day: 240 pounds wheat bran; 160 pounds gray wheat middlings; 100 pounds ground oats; 100 pounds corn meal; 40 pounds soybean meal; 40 pounds linseed meal; 60 pounds fish scrap; 60 pounds meat scrap. Nutritive ratio of mash, 1:2.7. Nutritive ratio of total ration, 1:4.4, Fiber in total ration, 5 per cent. Ash in total ration, 4.4 per cent.

During fall and winter when the highest possible production is desired a moist mash consisting of the above dry mash moistened with milk or water is fed at noon in such quantity as the birds will clean up in 15 minutes. Two and a half per cent finely granulated charcoal and one-half per cent finely sifted salt is included in the mash mixture.

A day's grain ration for the birds in the contest the past year has consisted of 329 pounds barley (80 pounds dry in the morning and 200 pounds sprouted and 40 pounds dry at night); 180 pounds whole wheat; 300 pounds cracked yellow corn. This makes the grain ration 40 per cent barley, 25 per cent wheat and 37½ per cent corn.

Planters who want to be satisfied, Should buy the seeds that are certified.

**Fall Chicks Pay**—Order now for September and October delivery. White, Brown, Buff Leghorns, B. Rocks, Reds, Anconas, B. Minorcas. McDonald Poultry Ranch, Rt. 1 Box 246, San Jose, California.

**White Leghorn Baby Chix for summer and fall months from stock Accredited by Sonoma County Farm Bureau.** We guarantee safe arrival. Write for prices and literature. The Pioneer Hatchery, 409 Sixth Street, Petaluma, California.

**Booking Orders Now for Fall and Spring** delivery. Order now, prompt delivery. Rhode Island Reds and White Leghorns. All orders given prompt attention. Oroville Hatchery, Irene Uren, Prop., Oroville, California.

**Eastman's Bred-to-Lay** Hoganized and Trapnested Barred Rocks. September chicks. Fairmead Poultry Farm, Fairmead, California.

**White Plymouth Rocks** April hatched cockerels $2.50 each or $25.00 per dozen. Cocks $3.00 each. Mrs. B. M. Jesch, Fallon, Nevada.

**Pit Games**—Old and young trios. R. H. Crane, Santa Rosa.

## POULTRY

### BLUE ANDALUSIANS

Prize-winning stock, hatching eggs $2.50, baby chicks reduced to 22c and 27c. Few older birds quoted on application. We are the largest breeders of Blue Andalusians in the U. S. BLACK AND BLUE HATCHERY, BALDWIN PARK, CALIFORNIA.

**Slightly Used 540 Egg Size Incubators**—Complete in every way. Liberal terms. Fanciers' Exchange, 640 So. Main, Los Angeles.

## TURKEYS

**Turkeys**—Purebred Giant Bronze. Goldbank-Copper King stock. Madison Square Garden's winning strains for sixteen years. Bronze King Farm, Merced, California.

**For Sale**—2 Bourbon Red Toms $15. 3 large rabbit does $2.50 each. Rasdall, Shawmut, California.

## FARM LAND FOR SALE

### SUTTER BASIN LANDS

In the heart of the Sacramento Valley, rich, deep "river bottom" soil, with a complete irrigation system is offered to good farmers. Any crop you may want to grow will find a good home here. Most liberal terms.

SUTTER BASIN COMPANY,
304 California Fruit Bldg.,
Sacramento, California.

**For Sale or Exchange** all or part of 320 acres level land. Suburban to Vancouver, city water, near electric car lines, can clear loan, and assume mortgage on California or Pacific Coast improved country or city property. Owner, J. D. Westenhaver, 2048 Stevens Street, Vancouver, British Columbia.

**For Sale**—Five acre home in prunes, olives, fruit and alfalfa. Modern 8 room house, phone, bath room and screen porch. Electric pumping plant and two wells. Plenty of water. One-fourth mile from city limits. Also ten acres of grain land. Owner, Mrs. E. Winnie, Corning, California.

**For Sale**—97 Acre Prune and Olive Orchard interplanted with seedless grapes, bearing. Modern Bungalow and pumping plant for irrigation. Located near Woodland on paved highway. Price $30,000—terms if desired. Call on or write Wm. Gould, Woodland, Yolo County, California.

**Paradise, The Orchard Home Place**—Water, electricity, telephone, good roads, healthful climate, reasonable prices. Box C. Publicity Committee, Paradise, California.

**Florida**—Information Indian River Section; book 148 illustrations and, letter five cents. Goodwin & Baker, Realtors, Fort Pierce, Florida.

**For Sale**—Ranches, Homes, Acres, free list. Wilson Bros., Santa Cruz, California.

## GOVERNMENT LAND

**Attention:** Million acres Government land for farming, grazing, timber. Near R. R. Plenty water. Send for folder. Rally, 1111 So. Alvarado, Los Angeles, California.

## MACHINERY

**For Sale Reservoirs, Grain Bins**—We have several big redwood tanks. Cheapest thing money will buy. Tanks, 2,000 bushel capacity, $68; 6,000 bushels, about 3,500 sacks, $125. Cement reservoirs crack. Quakes don't hurt wood tanks. 12,000 bushel capacity, $195 on cars. L. A. make, new galv. tanks, 10 sizes, 175 to 2,000 gals. at $45.25; 1,000, $35.25. Also rebuilt tanks. Pumps at lowest prewar prices. Windmills, tanks, pumps, cylinders, pump rod 3, 4, 6 in., irrigating pipe rebuilt, new, for less. Demmitt, 120 N. Main St., L. A.

**For Sale**—New Britain Garden Tractor, used 6 months, in splendid condition. Price $125.00. Hillcrest Country Club, Sawtelle, California. Phone 761290.

**For Sale**—New DeLaval Separator No. 15 with belt power attachment, used only three months. H. H. Sisson, Willits, California.

**For Sale**—Allwork Tractor, disc cultivator, three gang disc plow and hay rake, all in good condition, bargain. W. Dibble, Rancho La Puente, Puente.

## HOGS

**Tamworths, The Bacon Breed**... James J. Summerfield, Santa Rosa.

## SHEEP

**For Sale**—650 ewes, in lots to suit. Very large. Will shear 9 pounds wool. No old sheep. Price $8.50. Also 28 splendid rams at $10 to $20. Several Dorset and Shropshire rams. Sampson B. Wright, Santa Rosa, Calif.

**For Sale**—500 EWES bred for early lambing to Shropshire bucks. Delivery any time. Price, $9.00 per head. No broken months. Address Route A, Box 227, Redlands, California. Phone Suburban 0152.

## SEEDS AND PLANTS

**Carolina Strawberry Plants for Fall Planting**—the most prolific and best berry. Gives crop the first year. Postpaid $1.50 per hundred. Write for prices on larger quantities. G. M. Hawley, El Cajon, Rd. No. 2.

**D. Lotus Seed**—Manchurian stock for Japanese persimmons. Let me include your needs in my 1923 importation from Manchuria. Fred W. Kelsey, Nurseryman & Orchardist, El Monte, California.

## CATTLE

**Jersey Show Bull Calf For Sale.** Born November 29, 1921. Sire traces 6 times to Financial Count in 5 generations. Dam Register of Merit cow with 489 pounds butter on two milkings a day. Strong in Noble of Oakland and Financial blood. A splendid individual and priced to sell. Grant A. Brown, El Monte, Calif.

**Holsteins—For Sale**—Jane Garden Nero Abbekirk, a son of Sir Aggie de Kol Acme out of a 34 pound cow. Also two of his sons, and several high class females, registered and grade. Derryfield Farm, Capital National Bank Bldg., Sacramento.

**Guernseys — Grape Wild Farms — Berkshires**—Young bulls, from calf age up to 16 months old, of May Rose breeding and out of A. R. cows. Bred sows and gilts, service boars and pigs of both sexes for sale. Grape Wild Farms, Escalon, California. A. B. Humphrey, Proprietor.

**Registered Guernsey Bull Calves for Sale** from A. R. Dams and Sires. This herd passed the State Tuberculin test on July 10th, 1922, making one of the longest continuous T. B. free records of any Guernsey Herd on the Coast. James A. Brown, Capitola, California.

**Shorthorns** bred for range purposes and of Pure Scotch Blood Lines. Show herd won highest honors in 1917. Visitors welcome; information cheerfully given. T. T. Miller, Hollister, California.

**Yearly Record Holsteins**—Bulls from 500 to 1000 pound dams and by World Record sires. A. W. Morris & Sons, Woodland, California.

**Registered Holstein Bull** sired by King Pontiac Segis 3rd. Will sell cheap or trade for good cow. J. P. Kelly, San Bernardino.

**Aberdeen-Angus Cattle**—Registered bulls; heifers always on hand. Everything priced to please buyer. Brook Hollow Farm, Hollister, California.

**Breeders of Registered Shorthorns**—Milk strain; choice young stock for sale. John Lynch Ranch, Box 321, Petaluma.

**Registered Holstein Bulls** of various ages for sale. Millbrae Dairy, Millbrae, California.

**Herefords**—"Veramont Stock Farm," H. M. Barngrover, Prop., Stockton, California.

**Winsor Ranch Jerseys**—Bull calves with production behind them, at reasonable prices. BONITA, CALIFORNIA.

**Registered Herefords**—Anxiety IV strain. Breeding stock for sale. Chas. Rule, Duncans Mills, California.

## WANTED

**Competent Dairyman and Farmer**—35 years, married, no children, wants to take charge of place or work as first helper. Knowledge of thoroughbred stock and testing records, best references. Send particulars to L. Morel, P. O. Box 705, Modesto, Calif.

**Wanted Throughout California**, men with autos to represent established farm publication selling and collecting subscriptions. Flat salary. Write or call. J. H. Yetter, 317 Central Ave. Los Angeles.

**Wanted to Buy** dried apricots and peaches. Please mail samples to W. A. Collins, Box 397, packing house at Santa Fe Depot, Santa Ana, California.

**Wanted**—Hatching eggs of all kinds. Cultivator Box 23, Los Angeles.

## MISCELLANEOUS

**Natural Leaf Tobacco.** Chewing 5 pounds $1.75; 10 pounds, $3.00. Smoking, 5 pounds, $1.25; 10 pounds, $2.00. Send no money. Pay when received. Tobacco Growers Union, Paducah, Ky.

**Hemstitching and Picoting Attachment;** fits all sewing machines. Price $2.00. Checks 10c extra. Light's Mail Order House, Box 127, Birmingham, Ala.

**Kentucky Homespun Smoking Tobacco.** Ages in bulk. Mellow and sweet. 10 lbs., $1.50; 20 lbs., $2.75. Tobacco Growers Union, Lynnville, Kentucky.

**Leaf Tobacco**—good for smoking or to use in hen nests. Fifteen cents pound—express paid on 10 pounds or more. Grant, P. O. Box 466, Fresno, California.

**Peach Tree Borers** killed by Krystal Gas (P-C Benzine). Pound tin $1.00; five pounds $3.75, postpaid or C. O. D. Home Products Inc., Rahway, New Jersey

**For Sale Cheap**—About 200 8-foot trays, some 2x3 and other dryer accessories. Address L. N. Suydam, Glendora.

**3-Pound Box Absolutely Boneless Codfish,** fine white, new catch fish, delivered by mail, $1. Coffin Fish Co., Seattle, Wash.

## DUROC-JERSEYS

**Weanling Boars and Gilts by Pathfinder Wonder** (Great Wonder I am ex an 800 lb. Pathfinder sow) for $10 each. Bred sows and gilts. Derryfield Farm, Capital National Bank Bldg., Sacramento, California.

**Greenwood Farm Durocs**—An especially good lot of spring boars. Witherow & Stafford, Live Oak, California.

**Winsor Ranch Durocs**—The best of stock at reasonable prices. BONITA, CALIFORNIA.

## PAINT

ROOFING PAINT

ONLY 15c A GALLON

ASPHALTOID SAVES YOUR ROOF

Best roofing and preservative paint under sun sold direct to you by the manufacturer for only 15c a gallon. Write for free sample of Asphaltoid. Barn paint 45c gallon. Stains and paints 55c and 85c a gallon. Woolner Oil Co., 4th and Commonwealth, Los Angeles, Calif.

## TREES

**For Sale**—Grafted walnut trees, also citrus and deciduous trees. Order now for 1922 delivery. Get my prices. Ketscher's Nursery, 1101 E. 4th Street, Santa Ana, California. Phone 572-W.

**For Sale**—Grafted Walnut Trees for season of 1923. Placentia, Eureka, Chase and Payne. Early buyers get the best. C. W. Story Nurseries, Rivera, California.

**For Sale**—"Victory" Avocado Buds at $10.00 per hundred. Come by appointment or bring budder. A. B. Phelps, Horn Avenue, Sherman, Calif.

**For Sale**—Hachiya Persimmon Trees, grafted on lotus root. Get my prices. Geo. M. Ketscher, 1101 E. 4th Street, Santa Ana, California. Phone 572-W.

**1000 to 1500 Avocado Seedlings** for lining out. Address Wagner's Nursery, Pasadena.

**Beeman Tractor Cheap** — Young man learn trade. Cash Nursery, Sebastopol.

## HORTICULTURAL PRINTING

**Catalogues and Booklets,** office forms and correspondence stationery for the nursery, seed and florist trade; half-tone cuts of many standard plants. Correspondence invited. The Kruckeberg Press, 236 Court St., Los Angeles.

## DOGS

**Thoroughbred Airedale Puppies**—3 months old. Connell Ranch, ½ mile N. Savannah Garage, 1½ mile West El Monte.

## PATENT ATTORNEYS

**WEBSTER, WEBSTER & BLEWETT,** Savings and Loan Bldg., Stockton, California. Established 50 years. Send for free book on patents.

## OLIVE CROP

An olive grower reports:

Mission olives are scarce this year, many southern groves not producing. One of the large olive groves of Southern California and a fortunate one, will have but half a ton an acre and only part of them are Missions. Some 120 acre groves, mixed oil mostly, are almost without bearing this year in the south.

Olive prices are now figured by some packer canners at $215 for 12/16 size, a bonus for 13/16, and about $175 per ton for 11/16 with $125 per ton for the oil stuff.

One ten acre grove was contracted at $150 and they are common Missions, not budded, and don't look to be able to make any 11/16. There seems a shortage of large size Missions and of Ascolanos and Sevillanos and in the south a very short crop of all olives.

## REFRIGERTOR CARS HAVE RIGHT OF WAY

Following the conference between G. H. Hecke and the interstate commerce commission in Washington last week, the California department of agriculture received wire from Senator Shortridge: "Priority order on refrigerator cars issued by interstate commerce commission this morning."

This ruling, coupled with the fact that the interstate commerce commission has demanded the quick return of refrigerator empties to California rails, should go a long way in relieving congestion and aiding in the marketing of the great fruit crop of the state.

## FRUIT SHOW AT UNIVERSITY

The third annual fruit show at the University of California, College of Agriculture, is to be held November 16 to 18 under the auspices of the students' fruit show committee. The show will give the opportunity to assemble and exhibit a great variety of fruit from growers in widely different sections. It is expected that growers will respond by shipping samples of their fruit so that the show this year will be even more successful and instructive both to exhibitors and students. All fruit will be displayed with the variety and name and address of the grower attached. Since this is an educational enterprise on the part of the students no cash awards will be offered. Ribbons will be given to the first, second and third places in each class.

Fruit should be shipped express collect and upon receipt will be placed in cold storage until the date of the show.

Exhibition will be on the campus of the University of California at Berkeley.

# Hens and Chicks

By Jean A. Koethen

"MOTHER, mother," cried a little chick, as it came running in from its play yard to the coop, "Oh, mother, I'm so cold, hurry and warm my back." "There, there, child, clucked Mother Biddy, "don't cry. I'll have you warm in no time. Just cuddle under my wing and you'll be all right." So the little chick slipped under the softly lined wing and stuck its head out to watch its brothers and sisters. Mother Biddy kept on clucking, "There, there, there," and in a few minutes the chick was back in the mud playing with its brothers, warm and happy.

Another little chick in the same yard came to its mother that very day, begging, "Oh mother, please warm my back, "but the mother hen hardly paused in her efforts to move every bit of straw from one end of the coop to the other as quickly as possible. "Tut, tut," she scolded, "How can you expect me to stop when I am so busy? Just go and stand in the sun awhile and your back will be warm enough." So the little chick went and stood in the sun, but it didn't get warm. Then it leaned against one of its brothers, but still it didn't get warm. Then it went and stood in a corner and humped up its back to keep itself warm, but it only got chillier and chillier. Finally it stole up softly and crawled under its mother's fluff, but she began scratching more energetically than ever and the chick had to go back to its corner. When dinner time came it could only eat a mouthful, but that little gave it a stomachache. Next morning that chick lay dead and cold in the nest, and the good woman who owned the hen that wouldn't hover it when she came to feed her brood next morning wondered what that chick could have eaten.

A good hen is the best mother in the world, but a bad hen is the worst. When you find the mother of a newly hatched brood more anxious to scratch than to hover her brood, eliminate her. A jug of hot water is a better mother than she.

In handling hen mothers it is well to keep in mind that a hen has no intellignce. She has instinct, and if her instinct leads her to sit clucking all day with outspread wings, well and good. If it leads her to scratch most of the time and keep coop and litter and brood in a turmoil, her activities should be turned into another channel.

### You Furnish Intelligence

Much can be done, however, to control and subdue a too active hen mother. A darkened coop is an incentive to quiet. A small coop in which she cannot easily do much moving about is better for such a hen than a larger one. In any case she could be made as comfortable as possible by the use of clean litter with soft dirt or sand underneath, should be fed regularly, kept free from lice, and given all necessary protection from sun and wind and rain. A 2 by 3 coop, with tight roof, and a wire run for the chicks is very satisfactory. Confine the hen to the coop by means of a wire or slatted gate, but let the chicks out into the run after the first three or four days. Later on when they demand more range a brick may be placed under the end of the run. Chicks that have free range make very rapid growth and do not mind rainy weather if only they have a mother that will warm them when they need it. I remember a Buff Orpington hen of mine that brought 23 chicks through a storm that was almost a flood without the loss of a chick. While the coop was fairly swimming she still kept those chicks warm.

The hen that has hatched a brood should be kept on the nest for 24 hours if she can be kept quiet. Feed her out of the hand if necessary, remove shells and dead chicks, darken the nest if possible, and let her sit without uncovering the chicks till next day. By this time she will be anxious to get off and stretch her legs, and the chicks, if they are husky and the weather not too cold, will be climbing up the sides of the nest, looking for something to eat.

In moving from nest to coop great care should be taken to keep the chicks from chill. Remove the hen first and give her a chance to eat and dust. Have the coop in a sunny sheltered place, and cover the chicks up warm in a basket or box if they must be moved any distance. The avoidance of chill now means a husky, thrifty brood. Chill the first day or so is generally fatal.

The brood coop should be absolutely clean, absolutely tight on three sides and open on the fourth and should face south or east. The board bottom should be covered with clean, dry sand, and the sand covered with alfalfa leaves. On top of this litter may be scattered charcoal and chick grit for the chicks to pick at the first day, and dry breakfast oats when they are ready to eat.

### Feeding the Chicks

Chicks that have a good hen mother do not require as careful feeding as brooder chicks. This is partly because of the mothering they receive, partly, no doubt, because chicks in small broods always do better than chicks in large flocks. If you ask why this is so I can only ask in return why children do not thrive in the homes and institutions as they do in familes. Chicks are rased very successfully in flocks of a thousand or so, but the greater the flock the greater the care required to keep them healthy. Chicks raised the natural way are not menaced by coccidiosis or white diarrhea. If the coop is kept clean, and hen and chicks kept free from lice, and sufficient hovering given by the hen the chicks may eat almost anything and as much of it as they will. A few years ago it was thought necessary to start chicks on some special nursery feed such as hard boiled egg and bread or rolled oats; now the most successful poultrymen start them on chick feed and give neither bran nor mash till the fourth or fifth day. Some put bran before the chicks for a few days before starting the growing mash, others start the flock on the growing mash by the end of a week. Feeding small broods is in no way different from feeding large flocks except that there need not be the care to keep from overfeeding. Mash and grain may be kept before the chicks from the first, and they will not overeat if they have the chance to run which naturally reared chicks usually have.

Milk is of very great value to all chicks and gives them a start which nothing else gives. It does not greatly matter whether the milk is sweet or sour or fed in fountains or in the mash. I have started many a brood on bread moistened with sweet milk, and limited the amount fed only by its availability. At some experiment stations the dry mash is moistened two or three times a day with clabbered milk.

## A BREEDING PEN WITH SOME UNUSUAL AND NOVEL FEATURES

By O. S. Proctor

CHICKENS have been protected or unprotected by so many kinds and styles of houses that it would seem impossible to introduce any novelty along this line. But the breeding pens developed and in use at the Black and Blue Hatchery, Baldwin Park, seem to have achieved some distinction both in construction and system of operation.

In size as related to the number of birds the ratio is less than is usually considered necessary, but this is offset by the portability whereby the greatest cleanliness, fresh ground and inducement for the hens to scratch is achieved.

The pen is four feet wide, eight feet long, and two feet high, covered partially with a galvanized pan two inches deep, and the other part of the top is tar paper and sheet iron. We believe the use of a water container for a roof is novel, but it is not expensive and is very satisfactory as it serves three purposes, first, protection from sun or rain; second, a supply of water for the automatic drip, and third, to equalize the temperature.

The automatic drip is strikingly novel, simple and effective. It consists of a float which is composed of a board with a nail in each end to fit loosely in opposite corners of the pan; a short rubber tube leading from the bottom and edge of the pan, the free

ıd of which is supported by wires ıailed to one end of the board float. djusted by bending the wires to get ıe desired drip in the drinking ves-el.

The feeds are in one container with wo partitions on the end outside the en with feed adjustments inside. The iiddle section for mash is much ırger than the section for greens vhich is larger than the one for yster shells. All are covered by an xtension of the tar paper roof. 'he nests are in the opposite end and re simply a sheet iron trough ex-ending across the end and hinged to ıe turned up at night so the nests vill not be fouled, and give more oosting room.

Three roosts are provided, made of ½ by 3 inch, spaced 12 inches and 12 nches from the ground. The nests and oosts occupy one-half of the pen vhich is separated from the other half oy a board ½ inch by 12 inches by 4 feet so the roosting space is en-closed except the entrance which af-fords ample ventilation without drafts. The water pan is directly over the oosts and a sheet iron lid covers the iests. A burlap bag is secured to the op of the lid with a margin or flap n the water pan so water is drawn over the lid to evaporate and cool the nside of the house.

Fine big Blue Andalusians roost comfortably on one roost so nine hens and one rooster only need two roosts, out they need the room to insure ven-ilation.

In operation the ground is prepared ahead by planting heavily, wheat, bar-ley or oats, so moving the pen gives grain sprouts and greens as well as cleaning and an inducement for the hens to scratch. The feed boxes be-ing together under one cover facili-tates keeping all feeds before them. It is much easier than carrying the feed through doors into the pens and avoids carrying disease from pen to pen as is done where the attendant goes among the chickens.

# Poultry Queries

(Conducted by Jean A. Koethen)

### Limberneck

Limberneck can be cured by giving one teaspoon wood ashes sifted through a fine sieve," writes Mrs. R. H. Simonds of Orland. The sifted ashes is given in a tablespoon of water.

### SURFACE POTATOES

A government agricultural expert, writing in an Australian exchange, thus describes the methods and the results so far obtained from an experiment in potato growing, the potatoes being planted or placed on the surface of the soil, and then covered with straw in place of giving the seed a covering of earth.

Some soil, the writer points out, is too heavy and stiff for potatoes, and will not allow the tubers to expand. Growing them in straw was tried and the experiment is being continued. The ground is plowed deeply and harrowed into a good state of tilth; the potatoes are then placed by hand firmly in the soil until they are about half covered; then 12 to 15 inches of wheat straw is placed over them; this completes the planting. Nothing more is done until the potatoes are picked—not dug—from under the straw, for they lie on top of the ground around the sets.

Some people do not understand that the potato tuber is not the root of the plant, but a modified portion of a runner from the stem. The potato tubers must form above the seed planted, therefore if it is placed on top of the soil they have no option but to grow as they do. The straw forms a protection from the sun and other destructive agents the same as the earth does when grown in the ordinary way. The potatoes grown last year under straw were only a fair crop, but of beautiful shape, with lovely skins. Some were found in the straw hanging to the stem six inches off the ground; most of them were lying on the soil, and some were slightly buried. They can be looked at any time during growth by removing the straw, which must afterwards be replaced. The same plant has been looked at several times apparently without damaging the tubers. Will this method of growing potatoes pay? This cannot be answered at present, but further information is being obtained.

Experiments in growing potatoes under straw and under earth are now being carried on side by side, with the same variety and other conditions being equal; both are now forming tubers nicely. The straw, of course, is an item, also carting and laying it on, although the latter operation can be performed quickly, but there is no after cultivation, and no weeds grow—no digging, straw can be forked away quickly. If successful it will be a handy way for a kitchen garden, as the cook will merely have to go out, put aside the straw, and pick the best tubers off for the pot; those left will probably grow all the better. So far as known this method has not been tried in California, but E. D. McSweeney, well known potato grower of El Monte, says he will give it a tryout this fall.

### TROUBLES OF OUR OWN MAKING

Simple precautions would avert most of the railroad crossing horrors. Here are a few rules, which, if followed, would save many lives:

Never approach railroad tracks that must be crossed at grade, without this thought: "Here is the place where I must play safe!" Have your car under control, then you will be prepared for any emergency. You know the importance of having good brakes on your car. Look them over, from time to time.

Probably nine out of ten times there will not be a train near enough to check your progress over the tracks. Make no effort to go across, until, by careful use of both eyes and ears, you have sized up the situation.

All must agree that a little time spent in trying to protect life and limbs is a good investment. We use up some time hunting bargains in stores. Better plan to hold onto the life you possess. No bargain counter has another to offer you. When your end comes, you will be a long time dead.

Maybe, when you get near the railroad tracks, you see a train coming, and the thought comes into your mind, "I can beat it across!" That thought is a mere whim. Your judgment is not speaking. In such a case, wait for your sober second thought.

Remember that a fast train can run the quarter mile from the whistling post to the crossing in 15 seconds. Do you know just exactly how far you can make your car go in one-fourth of a minute? Most of us fail to do our best in an emergency.

Do you admire a man who tries to beat a train over a crossing, when he has his family or friends in the car with him, depending upon him for protection? If such a man were to run his business so carelessly as that, we greatly fear that the balance would show up on the wrong side of his ledger. Most of us are very weary of reading newspaper accounts of death and destruction. Let's be rooters for safety at the crossing!—Southern Pacific Bureau of News.

### EDUCATIONAL WORK AT SOUTHERN CALIFORNIA FAIR

The junior department will be the big and attractive feature at the Southern California Fair this fall and the boy and girl will be very much in evidence. Every department of junior activity will be shown in carefully set out details. The method of imparting vocational instruction used in our high schools will be shown in actual operation. The state will show the method used in its work of teaching new vocations to disabled citizens.

The junior fair takes up all branches of agricultural education and under the direction of the boys every department in agriculture and animal husbandry will be conducted. A model farm will be shown and the various divisions of farm work will be demonstrated by boys from agricultural high schools.

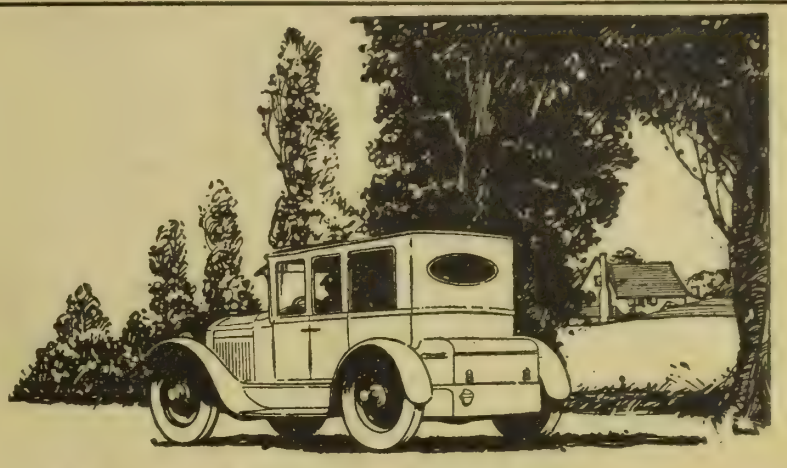
The state livestock judging contest will attract teams from sixty or more of the high schools of Southern California. The three high teams from Riverside with the three teams from Sacramento will compete for first honors at a central contest at Davis.

An agricultural short course will be conducted each day during the fair by competent instructors in front of the grandstand and some very essential part of farm economy, either in the animal or soil divisions will be demonstrated and discussed.

### CULL FOR PROFIT

"The way to meet present day conditions," says B. R. Holloway, of the Holly Hatchery, "is to raise more pullets, discard old hens, cull closer and keep only the high producers." Mr. Holloway finds the demand for hatchery chicks much greater than last year. He has now incubating 130,000 eggs, an increase of 50,000 over the fall of '21.

The Chinese made agriculture a part of their school courses over 4,000 years ago.



BIG POWER
for BIG AUTOMOBILES

You selected your car carefully for quality. Select your motor fuel the same way. It's unfair to feed a good car an inferior gasoline.

"Red Crown" answers completely the automotive engineer's demand for a motor fuel that will vaporize rapidly and uniformly in the carburetor and explode cleanly in the cylinders. *All* the heat units it contains are converted into power at the drive wheels.

"Red Crown" is uniform in quality—every gallon is the same, wherever and whenever you buy it.

Fill at the Red Crown sign—at Service Stations, at garages, or other dealers.

**Raisins, Sun-Maid Raisin Growers' Prices:**

Under the schedule of prices for the 1922 crop of raisins announced by the Board of Directors of the Sun Maid Raisin Growers to the trade August 9, the growers will receive 5¾ cents for Muscats, 6 cents for Sultanas, and 6½ cents for Thompson's sweat box basis. Northern bleached Thompsons, (Sun Maid quality) oil dipped, soda dipped or choice sulphur bleached Thompsons will bring the grower 6¼ cents. Fancy Northern sulphur bleached (Sun Maid quality) will bring $40 more per ton, extra fancy Northern sulphur bleached (Sun Maid quality) $60 more per ton. Southern bleached (Sun Maid quality) oil dipped, soda dipped and choice sulphur bleached will net the grower 6¾ cents. Fancy Southern sulphur bleached (Sun Maid quality) will bring 9cents. Extra fancy Southern sulphur bleached (Sun Maid quality) will bring 9 cents. Extra fancy Northern or Southern bleached packed by growers, (California brand) soda dipped, oil dipped and choice sulphur bleached are named at 5¾ cents. The price for fancy sulphur bleached (California brand) 9¼ cents. Muscat layers 3 and 4 crown, all packs will bring 7 4-10 cents. Six crowns will net 8 4-10 cents. A $15 bonus will be paid for making layers in addition to half-cent quality bonus for extra standard grade. Layers will be settled for on packout basis as provided for in the crop contract. "These prices," said F. A. Seymour, general manager, "will be returned to the grower on a sweat box basis. Their realization, however, depends upon the disposal of the entire crop at the new prices named by the board."

1921 crop practically sold out.

### HONEY

Market unsettled. Demand and movement light. Some inquiries from Europe but few sales. Adverse weather curtailing alfalfa yield. Hawaiian honey quoted per pound f. o. b. San Francisco, Water White, 6½ cents; Light Amber, 5½ cents; Dark Amber, 5¼ cents; Honey Dew Honey, 3¾ cents. Guatemala Honey quoted at 6½ cents per pound f. o. b. San Francisco.

| Blackeyes | 4.00 |
| Henderson Bush Limas | 8.00 |

### HAY AND FEEDSTUFF

A. W. Scott Co. says under date of September 2:

Receipts past week 1730 tons as compared with 1255 tons previous week. Export and coast shipments have been livelier and the demand has picked up considerably. Railroad conditions have caused a rush of water shipments wherever possible, and freight space is at a premium with rates increasing; this will probably cause weakness of shipments in the near future. Alfalfa continues strong, although the demand has dropped off somewhat and no sales of any quantity have been reported. Demand continues steady though rather light in volume causing holders to be firm in their prices throughout the producing districts. Millfeeds generally have been declining as the mills in the northwest starting up will be offering on this market at reduced figures to work off their surplus.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the market in San Francisco (for prices to consumers, charges of switching, cartage, commission and handling expenses must be added according to conditions.)

# Snappy Notes on Livestock

Any error herein is unintentional and subject to correction the following week. This summary is assembled from the best sources obtainable, and both producers and packers can assist by reporting actual sales or buys, giving names, dates and facts, and we will, if requested, withhold names. All we want is fact and a fair deal and correct information for the producers. Address A. L. Spellmeyer, care California Cultivator, 317 Central Avenue, Los Angeles. The Cultivator reaches over 40,000 producing farmers and livestock men.

Average price now paid for good 1100 pound beef steers Los Angeles is $7.25 per cwt. Some beef steers are held at 8 cents and the market is decidedly stronger. The last government report states the northern part of California is fairly well cleaned up of grass beef. I hear of 6 cent light beef. The $5.00 and $5.50 steers seem now to be a memory. Cows don't show the price and strength of steers and seem to hang about two cents lower instead of the usual one cent.

Lambs are strong on both fat and feeders. Practically the bulk of over 200,000 Arizona lambs have been already contracted, and most of them go north to feed yards, around the Ft. Collins and Colorado districts. Fat lamb sales up to $10.50 California. There is a strong demand for light California feeder lambs around the 8 and 9 cent market, and while some sold up north at the former price, there are no general offers at any specified price, though many offers to buy on the 8 cent price for feeders f. o. b. range.

Carcass prices haven't changed but are a trifle stronger, and on both lambs and beef are due for a change soon. Ten cent cow beef can be bought and $11.50 steer beef of very good quality, and cuts from the 27 cent lamb lists, but an applied $13.50 steer list seems on the way in the not distant future. When steer beef reaches a 16 cent list, with 14 cents actually applied, as is not altogether impossible this winter, we will know that cattle have started to come back in actual fact.

**Outside Conditions**

Northern Arizona, fine range and grass. Southern Arizona, good. New Mexico, spotted and dry. Texas, spotted and dry.

Arizona and New Mexico lambs have been fairly well contracted. Feeder cattle, yearlings and stock cattle seem slow to be contracted in New Mexico. Various lots of cows and calves are there quoted from $30 to $45 for cow and calf together; yearling steers from $24 to $25; two steers from $30 to $36; three steers from $40 to $45. Prices quoted covered some 10,000 cattle. Sheep prices are $11 to $11.50 per cwt. for feeder lambs, $5 to $6 for old ewes, and $11 per head for good range ewes.

Arizona prices run now 5 cents by weight f. o. b. for steers, feeders and stockers, or $22 to $25 per head for long yearlings, $32 to $36 for twos and $40 to $45 for threes. The cheaper prices apply on twos and threes on scattered numbers as straight lots of larger steers are held strong at the higher prices. Arizona lamb price at $10 for any feeder lamb, $10.50 for tops and $6 for old ewes. Arizona is more than half contracted on steers already. Buyers are now in several districts that were not previously cleaned up.

There are not many cattle in the Utah and Nevada districts offered now, and what there are seem to have a hard time to be able to make up their minds as to prices they want. The entire country is asking for buyers, and there are from California to Indiana more sellers than apparent buyers for various kinds of livestock.

The dairy trade in Los Angeles is very active and good. Dairy cows are being bought up in Northern districts as far as Wisconsin in the Middle West and brought to Los Angeles. Colorado is contributing. Very good T. B. tested Colorado six to seven gallon milkers can be bought there at $120 per head. Some lots of well marked twos Holstein heifers are offered in Colorado at $45 per head. Stockyards or no stockyards, Los Angeles is a market of a big district, for we use their milk cows and their fat cows, their steers and their lambs and swine.

I have no accurate and positive swine information that covers any new deals in the last few days and will put nothing out in this column without backing of actual deals or data. $9.50 to $10 f. o. b. country was last price reported to me, and 18 cents for carcass pork last list price.

C. C. Ellis was down from the Porterville district this week, looking to trade his vineyard for a cow ranch.

Niemann, the well known Elsinore butcher, who has been ranching in Tulare county for some time, is again headed back towards the south.

J. B. Herndon, head of New Mexico war finance, returned to Albuquerque this week to keep on helping the cattle and sheep men there.

Heber, Utah, sold lambs this week on the Kansas City market at $13.50 per cwt. They brought $9 per head net basis Heber. Down in New Mexico cows with calves at side sold at only three times the price of the Heber lambs.

A number of the Kingman cattlemen are in Los Angeles and some of them returned with some loan men this week, so there is something doing in that district in loans and cattle buys.

The Bailey ranch sold a few cars of nice steers this week to a local packer at a very nice price. The Bailey ranch is between Saugus and Lebec, and their cattle did well. They shipped them to the Globe yards and sold from that place.

A number of California feeder buyers are now out on the ranges. Feeders are stronger than they were and you don't hear of any 5 cent California feeder steers of good quality being offered this week, although I have heard of a few sales at $5.50 for small lots.

If strikes or something else don't spoil matters things look very favorable now for the California livestock men. Pure bred registered dairy bulls are offered at comparatively low price and from all parts come prices on various range bulls that are low enough to tempt purchase.—A. L. Spellmeyer.

## CALIFORNIA CATTLEMEN'S MARKET REPORT

San Francisco, Sept. 4.

The Chicago market received an increased number of cattle during the past week and maintained a steady price, increasing approximately 15 cents a hundred.

The San Francisco market remains strong with a particularly good demand for choice cattle. An increased number of sales are reported at 7 cents f. o. b. ranch. Sales at that price are reported from San Benito County on the coast, from San Joaquin and Sacramento Valley Counties, and one sale at 7 cents f. o. b. ranch for eight cars of choice steers was paid at Klamath Lake the early part of last week. Market quotations in newspapers have increased ½ cent during the past week, quotations now appearing at 7½ cents for number one steers, 5½ cents for number one cows, and 9 cents for calves f. o. b. San Francisco. This does not mean necessarily that the price has gone up, since more than that has been paid for choice steers during the past three or four weeks. It does indicate, however, a strong market.

The Los Angeles market remains strong, and a considerable number of sales at 7 cents f. o. b. ranch for choice steers are reported to Los Angeles buyers. Good and medium steers continue to sell from 6½ cents to 6¾ cents f. o. b. ranch.

The demand for feeder cattle remains strong, and members are urged to use their association offices for disposing of half-fat feeder cattle.

Do not forget the cattlemen's meeting to be held at the State Fair, Friday morning, September 8th, at 10 A. M. You are urged to attend. It is Cattlemen's Day at the State Fair.

Beware of the speculative buyers who are always most active on a rising market. Sell direct. The speculator's profit belongs to you.

Report sales promptly to R. M. Hagen, Secretary.

## CALIFORNIA CATTLEMEN'S REPORT

San Francisco, August 28.—The Chicago market showed a considerable increase in receipts during the past week and a drop of about ¼c in price. This situation is probably the result of grass cattle coming in from the northwest to eastern markets.

The San Francisco market remains steady with perhaps a stronger demand for good cattle than reported last week. While no sales have been reported at more than 7 cents f. o. b. ranch for good choice fat steers, yet the number of sales at that price is somewhat increased. These 7 cent sales are, of course, for good top cattle and the bulk of sales are for 6½ cents to 6¾ cents at the ranch. Such sales are reported from San Joaquin County and from as far south as Kern County to San Francisco buyers. Sales are reported at 5 cents for cows weighed at the ranch.

The Los Angeles market remains steady, with particularly strong demand for heavy cattle. The bulk of sales are reported at 6½ cents to 6¾ cents f. o. b. ranch for steers, and 5 cents f. o. b. ranch for cows. A contract sale of choice fed cattle is reported at 8 cents delivered in Los Angeles for steers, delivery to be made during the coming two months. This same contract sale includes cows at 6½ cents.

After the usual delay due to redtape, we can now report that the two government livestock reporters have actually arrived in California, being transferred from market reporting work at Chicago and St. Louis. A conference of these market reporters, state and government agencies, and representatives of livestock organizations, will be held on Wednesday, August 30, and actual livestock reporting by these government men will begin on September 1.

The supply of grass fat cattle coming from the mountains is not large, and the north coast section of the state is practically cleaned up at the present time. Hay fed cattle are reported to be selling at 6½ cents to 6¾ cents f. o. b. ranch in Arizona, and choice feeder steers are selling at 5 cents f. o. b. cars at Arizona points.

Do not forget the cattlemen's meeting to be held at the state fair on Friday, September 8, at 10 a. m. You are urged to attend this meeting.

Sell only prime cattle. Use your association to dispose of half fat cattle for feeder purposes. Report sales promptly to R. M. Hagen, secretary.

## ASSOCIATION NAMES PRUNE PRICES

Opening prices on the 1922 crop of prunes were named as follows by the California Prune and Apricot Growers Association:

| | |
|---|---|
| 20-30 | 23¼c per pound |
| 30-40 | 10¾c bulk basis |
| 40-50 | 8½c bulk basis |
| 50-60 | 7½c bulk basis |
| 60-70 | 7c bulk basis |
| 70-80 | 6½c bulk basis |
| 80-90 | 6¼c bulk basis |
| 90-100 | 6¼c bulk basis |
| 100-120 | 4½c per pound |
| 120-up | 4c per pound |

The above prices are named on the Sunsweet Brand. The Growers Brand is quoted at a quarter of a cent under this schedule. The above prices are figured on a bulk basis and do not include packing charge.

The association has this year delayed opening prices much later than in any previous season because of recent dull and unsettled market.

In commenting on the action just taken, General Manager Coykendall said:

"Our association faces a very unique situation. We have had for some weeks past a very dull trade condition. An early small demand from export markets provided foundation for a rather premature early development, and owing to the peak arrived at in this trading and to the domestic situation, the result of strikes and industrial tieup, we have had a decidedly dull market for many weeks past. With ready deliveries now in sight, we confidently look forward to renewed interest and trading and consider our prices entirely fair and worthy of trade's good attention.

Of course for the future as in all other businesses, we are dependent on conditions that may develop through the fall and winter. With settlement of strike conditions and renewed industrial activity, we would expect trading that will warrant a material advance in our schedule. At the present time whereas our sales firm at opening are confirmed at prices named above, we are now quoting the trade at a quarter of a cent advance.

"Our growers realizing all of the conditions surrounding the market at the present time, and especially the heavy crop of fruit prevalent through the nation and the world, will appreciate our opening prices. At times like the present, without the association the forced sale of many growers would bring about a total demoralization whereas with an association and with a certainty of reasonable delivery payment, the grower is in a position to stand for the maintenance of his market."

At the same time the association management announces that first payment to growers in the new season will be made all in cash on the following schedule:

20-30 10 cents per pound.
30-40 to 60-70 inclusive 4 cent basis.
70-80 to 90-100 inclusive 3 cent basis.
Sizes smaller than 100, 1½ and 1 cent per pound.

This payment, except on small sizes, is the same as last year, with the exception that the whole will be paid this year in cash whereas last year it was paid fifty per cent in cash and fifty per cent in notes.

## FOR POISONING ANTS

One of the most reliable ways of poisoning ants is to use equal parts tartar emetic and sugar. Moisten this with enough water to make into a syrup and pour into shallow dishes and set them in runways of the ants. They will eat very freely of this and as the poison does not act quickly, it will be carried to the burrows and fed to the larvae. In this way the old and the young die together, and a large colony is soon disposed of. In case the water dries out of the dish, more may be added, as this mixture does not spoil.—Colorado Agricultural College.

# *Look for* GREATER SATISFACTION *from the next tire you buy*

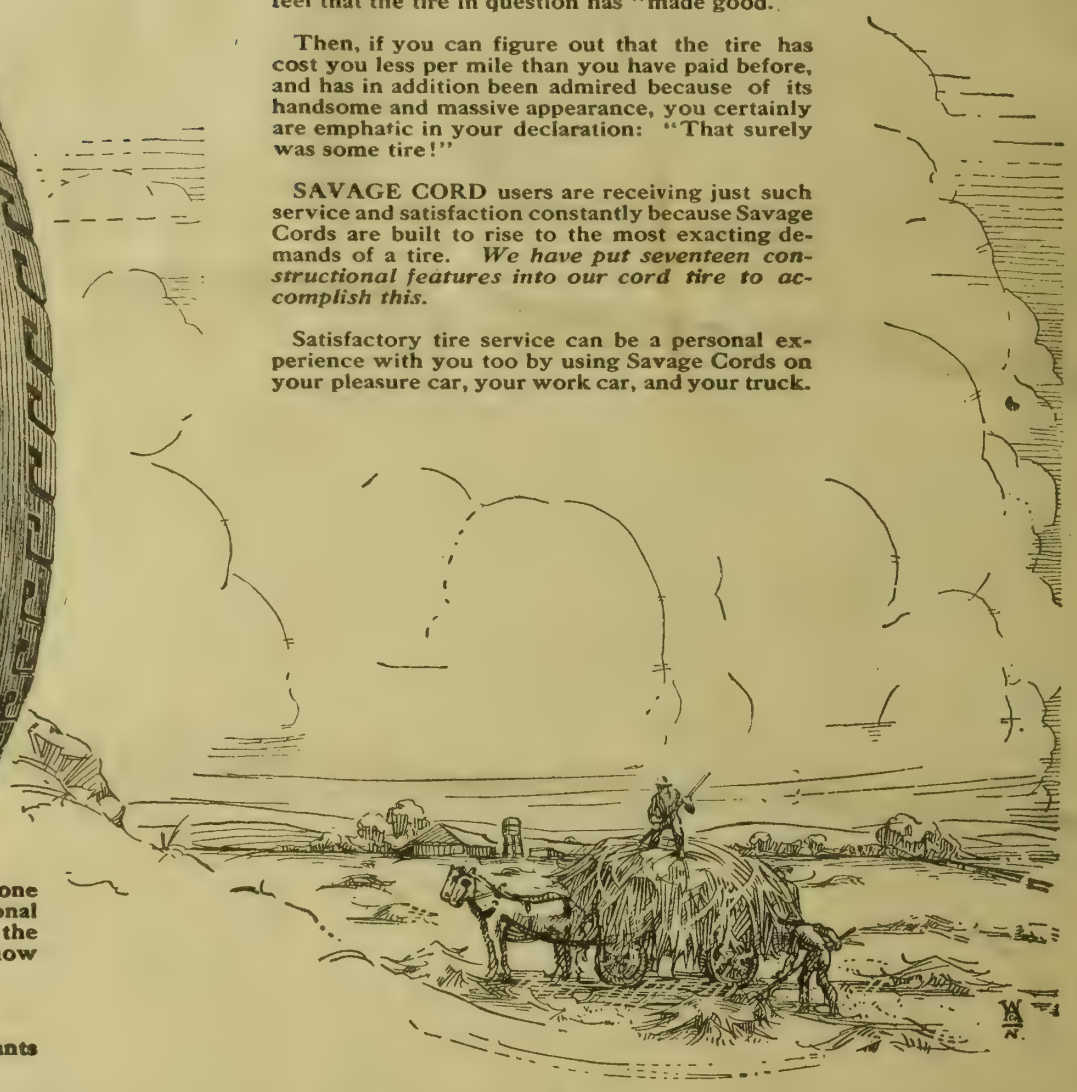
You feel that a tire has given you satisfactory service when it has hammered out more than the expected thousands of miles since it was put on the rim, and during that time has given you little or no trouble.

When you recall that much of the distance covered was over bad roads and through hard going, with perhaps a good deal of abuse because heavy loads and speed were necessary—then you feel that the tire in question has "made good."

Then, if you can figure out that the tire has cost you less per mile than you have paid before, and has in addition been admired because of its handsome and massive appearance, you certainly are emphatic in your declaration: "That surely was some tire!"

SAVAGE CORD users are receiving just such service and satisfaction constantly because Savage Cords are built to rise to the most exacting demands of a tire. *We have put seventeen constructional features into our cord tire to accomplish this.*

Satisfactory tire service can be a personal experience with you too by using Savage Cords on your pleasure car, your work car, and your truck.



Other good makes of tires may use one or more of the seventeen constructional features we have incorporated into the Savage Cord but no other tire that we know of begins to embody them all.

**WE GUARANTEE**

that not an ounce of shoddy or adulterants is used in the building of the

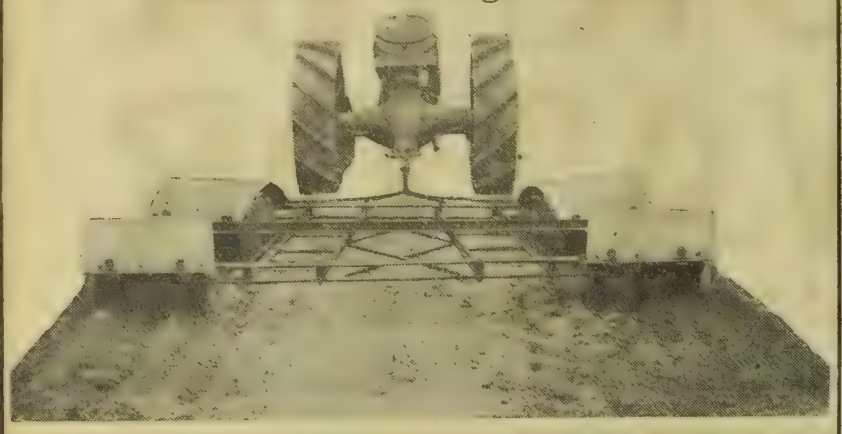
# BRENNEIS
# Extended Orchard Disc Harrow

For Fordson and Light Tractors



The first real Orchard Harrow that will go under the trees and not injure the branches or fruit.

Designed for California orchards.

Total height to top of guards 20 inches.

All working parts and load in direct line with axles and pull.

No twisting of frame or tilting up when loaded for deep tillage.

Frame will carry 500 pounds extra weights.

It is built for hard work and to deliver service.

Fitted with grease cups in easy reach yet entirely out of the way.

Comes equipped with 18 inch cutout discs.

Equipped with a simple yet positive automatic shift, which sets the discs at any angle and is controlled entirely from the tractor.

With one hand set the chain in the position desired and when the tractor starts it automatically pulls the harrow gangs in that position.

No levers to set, no cranks or wheels to turn, no ropes to pull, no spring to break. No trouble with this hitch as the tractor does the work.

This hitch is our own design and is being fully protected by patents.

10 foot wide, 5 foot cut (2½ foot on each side of tractor). Weight 750 lbs.

# SPEED WAGON

## For Every Kind of Hauling

Speed Wagons are today performing every kind of rural hauling and carrying.

Some one of the seven types of bodies that are now standard will do your work.

No matter whether yours be a general, a stock or grain farm; a commercial orchard, truck garden or chicken ranch—no matter where located, or what the nature of roads or loads—

Still a Speed Wagon will do your work quicker and cheaper.

Nearly 80,000 Speed Wagons now in use prove that.

Product of eighteen years of successful building of good motor vehicles, this Speed Wagon is the greatest single achievement of this famous organization.

# Horticulture and Its Implements on Dress Parade

By M. C. Holman

THE side shows, merry-go-rounds, Ferris wheel, catch penny schemes and other similar amusements were removed to a very remote section of the state fair grounds where they would least disturb the visitors who went there to view the state's progress and who were bent on getting as much out of the fair as possible. The attendance was made up of real, worth while folks there to learn what California is doing agriculturally. There was abundant proof that the census of the United States for 1920 is correct in placing California at the top.

The pumping tent revealed many improvements. The location was better, there was more space, more pumps and greater action. Small two inch pipes to the big six inch pipes, throwing water in every direction, conveyed an adequate idea of the power of the pumps and the tremendous utility of their operation.

The one big feature of the state fair is the horticultural building which stands in the center of the grounds. We have never seen the interior of this building so artistically decorated with designs in which California's fruit is made a part. From the beautiful statue of Liberty, which was kept constantly revolving, to the magnificient scenes of the broad California orchards, one passes through a veritable fairyland to see which is to realize that California, great in many things, is greatest of all in her magnificent orchards. Packed and processed fruits, vegetables and grains represent progress; they represent the utilization of our products in a most complete manner.

Mentioning only a few: There is a splendid exhibit by the state fish and game commission, in which live fish disported in miniature brooks and in glass cases. An artistic setting gave admirable opportunity for showing some of our native animals in their accustomed haunts. The commission also had a wonderful display of motion pictures.

It was most pleasing to note the harmony which exists between various groups of counties. The association of the northern counties presented a great display as did many of the central and southern counties. The mining counties had splendid showings of minerals.

Particularly notable was the exhibit in the section occupied by the state department of agriculture. This exhibit was probably never excelled in educational value. It occupied the entire south end of the building. The several departments were presided over by experts. The section of seed germination illustrated a complete story of seed testing. Thousands of dollars are saved each year by this branch in determining for prospective planters the germination value of the various seeds which are presented for examination.

In the pest control exhibit we had an opportunity of looking at several dozen of the dangerous Mediterranean flies. Fortunately they were safely pinned to a large board and had lost their power for further destruction. It has been said that if the Mediterranean fly gets into California it will, to a very great degree, destroy the fruit industry. Examples of its destructiveness in foreign countries have been enumerated many times and the quarantine against this pest is and should always be rigid.

We must not fail to give credit to the plant quarantine service of the department of agriculture for its vigilance in protecting the state. The sugar cane borer of India was taken from the baggage of a passenger who had attempted to land the pest at San Francisco. Some Kamani nuts coming from Hawaii were infested with larvae of the Mediterranean fly, and they were intercepted at San Francisco. Had the vigilance of the department been less, we cannot say what this shipment of these Kamani nuts would have meant to our state. The Oriental peach moth was intercepted coming into California from New Zealand. This is very destructive to peaches and the pest is now established in the eastern part of the United States, where it works terrible destruction each year and requires great vigilance to keep it under control. Specimens of these insects have been very carefully preserved for examination. It is not possible to urge too strongly that liberal appropriations be made each year to the department of agriculture, so that the fruit crop of California may not be blighted and production lessened.

A most interesting display of the department of agriculture was that of a dozen or more rodents. The method of proper extermination was adequately demonstrated. A complete chemical laboratory was in full operation showing some of the laboratory work of the department.

The Woman's Building is of special interest. It is presided over by Mrs. D. J. Milne, as official hostess. Mrs. Milne has been the hostess since the opening of the building in 1916 and her manner makes one feel perfectly at home. On the lower floor is conducted a baby clinic in which from 75 to 100 babies are examined each day. As a part of the duties the baby is given its bath, after which it is given a thorough going over, and a chart showing its physical status is presented to the admiring mother. Upon the health of the children depends the fate of the nation and judging by the babies presented for examination at the state fair, this nation should be particularly healthy.

There was also a dental clinic for the older children. Charts and posters from the California Dairy Council show the value of various food for children; also proper clothing and proper housing accommodations to produce the best results. This section is always thronged with interested mothers and each baby is given a special examination by the nutrition expert from the state's tuberculosis department. The lower floor also con-

A Couple of Buildings and Scenes in Farm Power and Implement Tents

1, Women's Building devoted to domestic science, needlework and fine arts. 2, Cletrac on a pedestal. 3, H. C. Shaw Company and general view in tractor tent. 4, Speaks for itself and is big enough to make its own way. 5, Tools and charts used in extension work of the tractor school. 6, University of California houses a big exhibit in its own building. Dairy products are also exhibited in right end of building. 7, Tractor dis-assembled to show working parts. It is reconstructed in daily demonstrations. 8, Exhibit of H. V. Carter Company. 9, A view of some of C. L. Best Company's tracklayers. 10, H.-P. tractor in Hadfield-Penfield exhibit. Also Fordson tracklaying device.

# Agricultural News Notes of the Pacific Coast

## Northern California

Rice harvesting commenced in Glenn County about September 15.

Stockmen of northeastern Modoc have shipped nearly all of their lambs to San Francisco.

Sonoma County's Gravenstein crop was about 800 carloads as against 350 carloads last year.

The second annual convention of the Placer County fruit growers will be held in Auburn on October 4 and 5.

The first rice cut in the whole rice belt of Central California was harvested on the Packer ranch, near Willows, September 2.

The Applegate orchard at Codora, Glenn County, has sold more than $2,500 of peaches from four acres.

The turkey crop for Tehama and Glenn Counties is estimated at more than 100,000 for the coming holiday trade.

More than 400 people are engaged in harvesting the fruit crop on the Superior ranch near Monroeville, Glenn County.

Livermore Valley, Alameda County, reports a heavy grape crop, but late cool weather will defer picking until late September.

Five makes of heading devices will be used to harvest the White Yolo at the University of California farm at Davis about October 1.

Twelve silver cups will be awarded in Sonoma County for the best Gravenstein apples, at a contest to be held at Santa Rosa the last week in September.

The final organization of the Glenn County cow testing association was completed by election of Peter Kasak as president and M. G. Haigh as secretary.

There are 108 entries made in the livestock division of the Glenn County fair by members of the agricultural clubs. Fair will be held next week, September 18-23, at Orland.

The first government report of livestock market was issued by the San Francisco office, September 7. Federal and state departments of agriculture combine in the service.

"Sixty per cent of the municipal expenses of Palo Alto are paid by the revenues of the public utility enterprises owned and operated by the city," says Professor West of Stanford University.

The Sun-Maid Raisin Growers plant at Yuba City, though a remodeled packing house, is equipped with latest style raisin stemmers and recleaners and is practically a duplicate of installations through the San Joaquin Valley.

The railroad commission has restored freight rates on paddy rice to a basis of 25 per cent in excess of grain rates and ordered reparation to shippers in excess of this ratio. This affects mainly Glenn and Colusa County shippers.

A survey by the Sonoma County farm bureau of the value of silage as compared with other feeds in the dairy district shows that an increase of seven and two-tenths pounds of butterfat per month per cow was obtained in the herds being fed silage as compared with those not receiving this feed.

## Central California

Tulare County fair is on this week, September 13-16.

Clovis, Fresno County, reports fruit shipments cut 50 per cent by car shortage.

Several new bleaching houses have been built at Yettem, Tulare County, for handling Thompson Seedless.

Leon Leighton, who lives near Keyes, Stanislaus County, has at the state fair an exhibit of 69 varieties of fruit.

Grain fires on the Turlock Garden Lands property near Jennings destroyed between $5,000 and $6,000 worth of grain.

Chester H. Rowell has announced his resignation from the state railroad commission, to take effect January 1.

Raisin growers are urged by association inspectors not to pick grapes until they show 23 to 24 per cent sugar content.

Hilmar, Merced County, though ready for a big crowd at its community fair, was surprised at the numbers who came.

The Spreckels ranch at Aptos, Santa Cruz County, has been sold to Fred L. Somer of Pomona. It is reported that it will be subdivided.

Early season estimates of a raisin pack of 250,000 tons will probably be materially raised because of strike forcing more extensive drying.

The Weed Patch farm center held its first annual community fair at Vinland on Saturday, September 2. Large crowds attended from Arvin, Edison, Fairfax and Bakersfield.

The Sun-Maid plant at Dinuba is a three story building of reinforced concrete and brick 80 by 140 feet. There will be many new features in equipment.

First carload of dried peaches from Kings County was sent, September 2, from the Hanford plant of the California Peach and Fig Growers, designed for Bordeaux, France.

A shipment of Thompson Seedless grapes showing sugar content of 27 per cent was made by J. F. Frantz of Riverbank, according to Horticultural Commissioner Rutherford.

A record price for Alicante Bouschet grapes was paid when five carloads, grown on ten acres of land on the A. W. Haydock ranch, on the Coffee road, east of Modesto, brought $140 a ton.

A grape exposition is feature of the Madera County fair being held this week, September 14-16, at Chowchilla. Madera County now has approximately 30,000 acres in vineyard, about half of it bearing.

A special rain forecast for raisin growers will be made by the United States weather bureau, daily after 6 p. m. Growers may telephone for this information to Fresno 5800 during office hours; Fresno 5809 between 5 and 9 p. m., and Sundays and holidays.

Meeting in Visalia in all day session, September 1, directors of the 14 ditch companies on the Kaweah river, plaintiffs in the five year old litigation which has cost $450,000 already, rejected proposition for ending suit, submitted by Lindsay-Strathmore committeemen.

## Southern California

Southern California Apple Show at Yucaipa, November 9-12.

The Ventura County Calf Club has been awarded a silver cup for display at state fair.

Bee Inspector Marks of Ventura County is finding much honey still in beekeepers hands.

Riverside is busy with preparations for the Southern California Fair to be held October 10-15.

Cotton growers of the Bard district met, August 26 to sign up cooperative cotton marketing contracts.

The Riverside plant of the California Growers Association is handling 100 tons of peaches a day.

Several arrests were made at Blythe last week of ranchers who permitted Johnson grass on their premises.

The Valley Packing Association is now packing early varieties of Coachella Valley dates at El Monte.

An interstate bridge across the Colorado River at Blythe is being urged by the Indio chamber of commerce.

C. J. Claussen, nurseryman of Brawley, says that pears will some day be the third important fruit crop in the valley.

Special arrangements are being made for featuring livestock at the Orange County fair at Santa Ana, September 27-30.

Miss O. A. Miller, has arrived in El Centro to take up her duties as home demonstration agent of Imperial County. She succeeds Mrs. Yonge.

A prize of $25 is offered by the Deciduous Fruit Distributors of Southern California for a brand name. The office of the association will be opened at Redlands.

Better cows and more feed will bring prosperity to Imperial Valley says Vice President Fuller of the Southern Trust and Commerce Banks at El Centro and Brawley.

R. L. Churchill, manager of the California Lima Bean Growers, has returned from a four weeks trip through Eastern markets. He reports beans in Michigan late but a big yield in sight.

The union stockyards in Los Angeles, which contemplate the expenditure of millions and giving the opportunity for livestock men to secure advantage of real competition, is nearing the state of active construction.

A shipment of 10,000 palm leaves will go from Coachella in time to reach New York for Jewish feasts, October 7-15. The leaves are chosen from near the heart of the tree. Prior to the war these palms were imported from Italy.

Bee Inspector Hansen of San Diego County reports nectar flow not as large as had been hoped early in the season. Buckwheat, white and purple sages, mullein and tarweed are still holding out in some of the higher altitudes.

The city council of Los Angeles fixed the tax levy for the fiscal year at $1.26 per hundred of valuation. This is a reduction of 19 cents a hundred from last year when the rate was $1.45. This reduction of 19 cents is made possible by funds turned in to the city from the bureau of light, water and power. In addition a reduction of 10 per cent in electric rates was made a short time ago.

## The Coast and General

Some lettuce has been seeded in Arizona truck raising sections.

Special express refrigerator service brought berries from Spokane to Chicago this year in 80 hours.

Consul L. Smith at Saigon, says the Indo-Chinese buy each year 47,000,000 francs worth of foreign sweets, mostly from China.

Canadian cattle, for 25 years quarantined from ports of the United Kingdom will soon, it is announced, be permitted entry.

The Arizona highway commission will soon let contracts on the 42 miles from Welton to Aztec, another link in the Yuma-Phoenix road.

Hot dry weather in dairying sections of the East has reduced butter production. Storage holdings show decrease over last year at this time.

Filled milk interests have withdrawn motion for rehearing of case in which supreme court of Wisconsin upheld the law prohibiting manufacture and sale of filled milk within the state.

Australia is seeking new markets for their livestock and meat supplies The Grazers' Association of New South Wales is inquiring into the possibilities of Java, Japan, and China as markets.

The Oregon Growers' Cooperative Association reports the loganberry season practically closed on August 1. The association handled 2,810,000 pounds which were sold fresh, dried, canned and barreled.

The coffee beetle, which has for years been destroying coffee plantations throughout Africa, the East Indies, and other coffee growing districts, may at last be curbed by a recent discovery in Java.

In Steuben County, New York, the battle is on against tuberculosis. Veterinarians have tested every one of the more than 50,000 cattle in the area. The United States reports this the biggest job undertaken under the area plan of eradication.

The 1910-1914 average sugar beet acreage harvested in Russia was 1,832,622; total yield, 12,358,912 long tons. In the season of 1921-22 acreage harvested was 292,040; yield, 492,987 long tons. Yield per acre in 1910-14 period was 6.74 long tons; in 1921-22, .96 tons.

South Africa's orchards contain 116,320 lemon trees, 1,382,410 orange trees, 323,300 tangerine trees, 1,211,550 apple trees, 907,800 apricot, 105,300 mango, 57,560 nectarines, 2,411,270 peach, 542,420 pear, and 995,570 plum trees, according to the government census. Thousands of acres are devoted to grapes and currants, and the South African dried fruit exports, the bulk of which goes to England, are growing larger.

Out through Ohio, Indiana and Iowa hundreds of thousands of live chicks, but a few days out of their shells, are shipped up to Manitoba, Canada, every spring. The seasons are so late there that it is difficult to procure fertile eggs in sufficient quantities early enough to supply the demand for young chickens and to produce birds for breeding purposes. Heated cars keep the youngsters warm, and generally speaking, the loss in consequence of the long haul and bad weather is insignificant.

# Great Honors Won by Purebreds at State Fair

THE judges of the livestock classes were unanimous in that breeders of California purebreds are worthy of highest commendation for thoroughgoing work. "Never saw better at any state fair," was a common expression. The best comment which can be made is that by Jack Klein, Prof. Hughes, R. A. Condee and others who give of their observations made through several days of the judging in the different rings. These are especially for Cultivator readers.

We regret that we cannot give all the awards and comments in this issue. A continuation to another week, however, will, we hope, be permitted by our readers. This has been made necessary because of the efficient work of "the boys" who have put in two hard weeks at Sacramento.

## BEEF CATTLE SHOW

The display of beef cattle at this year's fair was short of many former fairs in point of numbers but most of the old time breeders were there even though their herds were smaller than formerly. The quality was exceedingly high and competition in most classes was very keen.

One of the features of the show was the winnings of men who have shown but once or twice before. They cut in on the old timers and in some cases took most of the money.

### Shorthorns

The outstanding feature of the Shorthorn competition was the clean up made by the Caledonia Farms, which took first in every class but two and won all championships. This was not done without competition but was against herds which in former years won most of the money and returned this year stronger than ever. Caledonia was simply invincible and could not be headed. The showing of the calves of Imp. Caledonia, who died last week, mark him as one of the greatest Shorthorn bulls ever in the West. His get of sire were first and second and the first get included both the grand champions.

Pacheco, Straloch and Tom Miller were consistent contenders and won most of the balance of the money.

Exhibitors: Caledonia Farms, West Sacramento. Edinger Johnston Co., Hood. T. S. Glide, Davis. Thos. T. Miller, Hollister. Pacheco Cattle Co., Hollister. Straloch Farm, Davis. Howard Vaughn, Dixon.

The awards follow:

Three bulls owned by exhibitor—1 and 2, Caledonia. 3, Straloch. 4, Pacheco. 5, Miller.

Two bulls bred and owned by exhibitor—1, 2 and 3, Caledonia. 4, Pacheco. 5, Miller.

Aged bull—1, Caledonia on Gainford Matchless. 2, Miller on Milmar Matchless. 3, Vaughn on Clarion.

Two year old—1, Caledonia on Caledonia King 2nd. 2, Straloch Farm on Imp. Braywood Collynie. 3, Pacheco on Pacheco Lad 215th. 4, Miller on Milmar Sultan.

Senior yearling bull—1, Caledonia on The Caledonian. 2, Glide on Hilcrest Lord. 3, Miller on Stamp of Milmar.

Junior yearling bull—1, Straloch Farm on Helmsman. 2, Miller on Milmar Sultan. 3, Pacheco on Pacheco Lad 284th.

Senior calf bull—1, Caledonia on Caledonia Omega. 2, Caledonia on Caledonia Emblem. 3, Caledonia on Caledonia Supreme. 4, Straloch Farm on Village Cumberland 107. 5, Pacheco on Pacheco Lad 314th. 6, Miller on Sultan Milmar. 7, Glide on Lord Perfection 2nd.

Junior bull calf—1, Caledonia on Caledonia Commander. 2, Straloch Farm on Straloch Marquis. 3, Pacheco on Pacheco Fairplay. 4, Miller on Milmar Stamp 6th. 5, Edinger Johnston on Rosebud Ensign.

Aged cow—1, Caledonia on Glenbessie 3rd.

Two year old—1, Caledonia on Glenbrooks Memory 43rd. 2, Miller on White Briar Milmar.

Senior yearling heifer—1, Pacheco on Knights Lassie. 2, Caledonia on Caledonia Queen. 3, Straloch Farm on Straloch Maria. 4, Caledonia on Caledonia Rosetta. 5, Miller on White Milmar. 6, Miller on Choice Beauty Milmar 4th.

Junior yearling heifer—1, Caledonia on Caledonia Mischief 2nd. 2, Caledonia on Caledonia Countess. 3, Pacheco on Pacheco Lass 280th. 4, Glide on Village Lassie 2nd. 5, Straloch on Silver Missie H 51. 6, Glide on Village Rose 2nd. 7, Miller on Milmar Mistletoe 2nd. 8, Glide on Lady Sweetheart 2nd.

Senior heifer calf—1, Pacheco on Silver Beauty. 2, Caledonia on Matchless Missie. 3, Miller on Beauty Milmar. 4, Straloch on Straloch Fashioness No. 62. 5, Straloch on Missie of Straloch No. 55. 6, Glide on Cheerful Maid 6th. 7, Straloch Farm on Straloch Fashion No. 588, Pacheco on Silver Beauty.

Senior and grand champion bull—Caledonia Farms on Caledonia King 2nd.

Junior champion bull—Caledonia Farms on Caledonia Commander.

Senior champion female — Caledonia Farms on Glenbessie 3rd.

Junior and grand champion female—Caledonia Farms on Caledonia Mischief 2nd.

Aged herd—1, Caledonia.

Yearling herd—1, Caledonia. 2, Pacheco. 3, Straloch Farm. 4, Glide.

Calf herd—1, Caledonia. 2, Pacheco. 3, Straloch Farms. 4, Glide.

Get of sire—1, Caledonia Farms on get of Caledonia. 2, Caledonia Farms on get of Caledonia. 3, Miller on Milmar. 4, Straloch Farms.

Breeders young herd—1, Caledonia Farms. 2, Pacheco. 3, Straloch Farm. 4, Glide.

### Herefords

The Hereford show was the strongest in the beef breeds and the prize money was well distributed. William Briggs and Son, who are comparatively new breeders, won grand champion bull and C. S. Howard, showing for the second time, had the champion female.

Cazier and Bunting were also strong and took many ribbons. The get of Beau Blanchard 76 won for him, showing that he is a great breeding as well as show bull.

Exhibitors: H. A. Baldwin, Pleasanton; Wm. Briggs & Son, Dixon; J. A. Bunting, Mission San Jose; G. W. Burgess, Casa Grande, Arizona; California Polytechnic School, San Luis Obispo; Jno. H. Cazier & Sons Co., Wells, Nevada; G. W. Emmons, Danville; H. H. Gable, Esparto; C. S. Howard, Willitts; E. A. Noyes & Sons, Sutter; Chas. Rule, Jenner.

The awards follow:

Three bulls owned by exhibitor—1 and 2, Cazier. 3, Howard. 4, Bunting. 5, Gable. 6, Noyes. 7, Briggs.

Two bulls bred and owned by exhibitor—1, Cazier. 2, Cazier. 3, Bunting. 4, Noyes. 5, Briggs. 6, Cazier. 7, Gable.

Aged bull—1, Briggs on Lincoln Domino. 2, Rule on Roehampton 34th. 3, Burgess on San Carlos.

Two years old and under three—1, Gable on Real atrician. 2, Howard on Mischief Fairfax. 3, Noyes on Milo Corker. 4, Gable on Aristocrat. 5, Noyes on California Mischief.

Senior yearling bull—1, Cazier on Beau Utah. 2, Burgess on Beau Boniface. 3, Burgess on Beau Grand Jr.

Junior yearling bull—1, Howard on Beau Blanchard Jr. 2, Cazier on Blanchard 16th. 3, Cazier on Blanchard 23rd. 4, Briggs on Red Rupert. 5, Burgess on Modesty Domino. 6, Emmons on Little Wizard. 7, California Polythechnic School on Blanchard 15th.

Senior bull calf—1, Cazier on Blanchard 32nd. 2, Howard on Beau Perfect 1st. 3, Cazier on Blanchard 27th. 4, Bunting on Mission 2nd. 5, Noyes on Ideal Corker. 6, Cazier on Blanchard 33rd. 7, Bunting on Mission Brummel. 8, Rule on Dandy Domino.

Junior bull calf—1, Briggs on Donald Dare 1st. 2, Bunting on Mission Paragon. 3, Gable on Woodland. 4, Cazier on Lincoln Blanchard. 5, Howard on Prince Mansell 6th. 6, Briggs on Donald Lad 3rd. 7, Gable on Yolo Lad. 8, Baldwin on Anxiety's Lad.

Cows two years old—1, Howard on Lady Fairfax 20th. 2, Baldwin on Aurora 2nd.

Senior yearling heifer—1, Cazier on Aloha 2nd. 2, Briggs on Miss Dare 20th. 3, Baldwin on Princess B. M. 4, Emmons on Diablo Beauty. 5, California Polytechnic School on Loyise 9th. 6, California Polytechnic School on Eulalie 5th. 7, Emmons on Diablo Gladelis.

Junior yearling heifer—1, Cazier on Aurora 3rd. 2, Briggs on Eulalie Velie. 3, Briggs on Susette Velie. 4, Noyes on I. B. A. Mischief. 5, Noyes on May Corker.

Senior heifer calf—1, Baldwin on Lady Dominic. 2, Howard on Bonnie Rupert 2nd. 3, Rule on Gingerbread 19th. 4, Cazier on Venetia 7th. 5, Howard on Lady Mansell 3rd. 6, Bunting on Mission May. 7, Bunting on Mission Helen.

Senior and grand champion bull—Briggs on Lincoln Domino.

Junior champion bull—Cazier on Blanchard 32nd.

Senior and grand champion female—Howard on Lady Fairfax 20th.

Junior champion female—Baldwin on Lady Domino.

Yearling herd—1, Cazier.

Calf herd—1, Cazier. 2, Bunting.

Get of sire—1, Cazier on Sire Beau Blanchard 76th. 2, Bunting on Sire Mission 2nd. 3, Cazier on Sire Beau Blanchard 76th. 4, Noyes on Sire Pacific Corker. 5, California Polytechnic School on Sire Harris Standard 2nd.

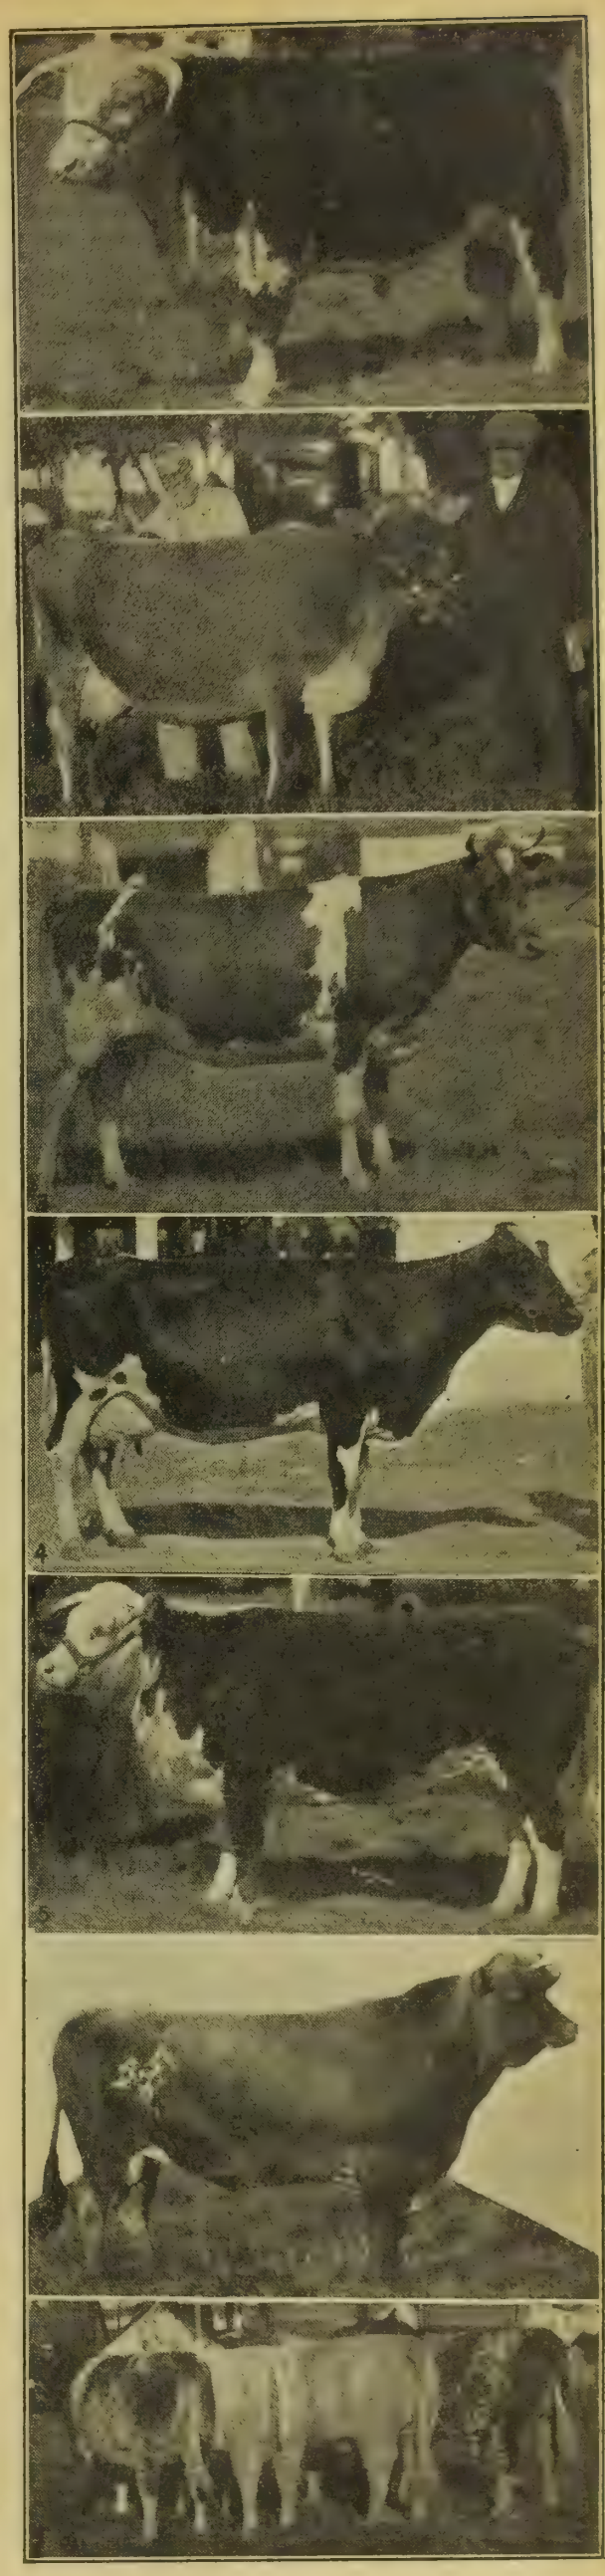
Breeders young herd—1, Cazier.

### Fat Cattle

All breeds competing.

Steer one year and under two—1, Bunting on Mission Jim. 2, Caledonia on Village King. 3, Straloch on Straloch Corporal 95. 4, Vaughn on Cumberland Lad. 5, Noyes on Bob.

(Continued on Page 295)



State Fair Super Quality Dressed in Its Prettiest

Senior and Grand Champion Hereford bull, Lincoln Domino, owned by Wm. Briggs & Son.

Senior and Grand Champion Jersey cow, Salome of Mossdale, owned by Jas. Thorp. Salome has five times won grand championships. Guy Miller standing at her head; Locke of Lockeford in the background.

Grand Champion Guernsey cow, Mayhew's Bonnie Lass, owned by A. B. Humphrey.

Grand Champion Holstein cow, Ava Model Hengerveld 2d, owned by Fred Hartsook.

Senior and Grand champion Hereford female, Lady Fairfax 20th, owned by C. S. Howard.

Senior and Grand Champion Jersey bull, Financial Corrector, owned by Waterloo Jersey Farm.

First prize get of sire on get of Caledonia, owned by Caledonia Farm. Bull at right, Caledonia King 2d, is Grand Champion bull while the second heifer from the left, Caledonia Mischief 2d, is Grand Champion cow.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If among the more than 40,000 Cultivator's weekly circulation any fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

## EDITORIALETTES

The six illustrations on the cover give the Cultivator readers a look-in at the state fair. We are denied the odors of the pines and the fruits which pervaded the atmosphere of the great horticultural building but the fair is visualized. The upper left photo shows the Pacific Gas and Electric and the Northern California Counties Association exhibits. Modoc, Lassen, Shasta and the other northern counties are there represented. Those two exhibits, as they were placed in the horticultural building, were worth hours of study. Next picture below shows the Tulare foothills where thousands of cattle roam and where citrus orchards are crowding in at every point. Below on the plains are thousands of acres of meadows and the tiny train loaded with statistics of the county's productions and the caboose of Prosperity at the end of the train. In the immediate foreground are the production of orchard and vineyard. Lower left photograph shows Fresno County's great diversity. That county is a wonder as a raisin producer yet, anxious to show her diversity, she allowed plums, peaches, apples, pears, figs, nuts, pumpkins and grains to fill the cases, tables, shelves and the big glass jars until raisins seem secondary.

* * *

Several exhibits were sent up from south of the Tehachapi. We have the photograph of but one. It is of Los Angeles County and is shown in the upper right hand photo on the cover. There are Sunkist oranges, Sunkist lemons, Diamond Brand walnuts. There are chayotes, cabbages, squash, certified potatoes, "egg fruit," roselle—but why mention everything grown in California? The next photograph below is that of Kern County. She exhibits mountains of fruit. The artist helps a little by the cloud effect he has worked in but primarily the fresh products of orchard, vineyard and farm constitute Kern County's mountains. The North Bay Counties Association tops the photograph in lower right corner. In that space Sonoma, Napa, Lake, Mendocino, Humboldt, Del Norte and other counties made a forest of beauty with exhibits of their farms. San Joaquin County is in the foreground with her exhibits of grain and all kinds of fruits. Note that San Joaquin features in the very center of its exhibit a great top made of the county products in proof that San Joaquin is the "top county of the San Joaquin Valley."

* * *

All Southern California united in an industrial exposition which has been held in Los Angeles during the last two weeks. Agriculture did not hold a very important position although the exposition was held in the greatest of agricultural counties. Agricultural implements and equipment, and especially farm power exhibits, were, however, numerous. Viewed from the standpoint of "All produced in California," it was a most striking exhibit. One immense tent was filled with exhibits of farm power and farm equipment. In addition there were many booths constructed in which there were exhibits and demonstrations of labor saving appliances. Now comes the announcement that California manufacturers may soon be supplied with pig iron from furnaces on the coast, ore being shipped from the mountain states.

## RACING WITH GAMBLING"

The gamblers are certainly making desperate efforts to bring back old time racetrack conditions with gambling as the principal feature. They have secured sufficient signatures to put on the ballot this fall the initiative measure known as "Horse Racing with Gambling Bill."

The Pacific Coast Jockey Club, devoted to clean sport, is in the field emphatically opposing the proposed bill. Secretary Spreckels of that organization writes:

"We desire to inform the voters of California that we are unalterably opposed to the adoption of that measure or any like attempt to introduce gambling on horse races. It is the aim of the Pacific Coast Jockey Club to promote clean sport for the people and to encourage breeding of thoroughbred horses in California. It is the opinion of the Pacific Coast Jockey Club that the adoption of the Horse Racing with Gambling Bill would seriously interfere with these high aims and that it would again bring horse racing into disrepute in this state. Those who are connected with our organization are moved by a desire to restore horse racing on a legitimate basis and as a public benefit. We ask those voters who agree with the racing principles of this association to vote against the adoption of the Horse Racing with Gambling measure."

## COOPERATE

The poultrymen have reached the stage of "hanging together or hanging separately." A large number of them have been hanging together very nicely in the great cooperative egg marketing associations which have succeeded in saving the industry during the past few years. We believe implicitly in these associations and the great work that they have done. The industry has increased wonderfully during the past few years, yet, handled through the association, the egg and broiler output has resulted in fair return to the producer. Curious because of the success of California poultrymen, Prof. James E. Rice, head of the poultry department of the New York state college of agriculture, has been in California looking us over. He has observed California's standardization methods. He remarked that the success of our standardized eggs in the eastern markets has waked up the eastern poultrymen to the necessity of improving their grading and putting their eggs on the market in more attractive shape. They are now beginning to do this extensively and consequently are giving us serious competition in those markets. If we are to retain our hold there, it is, in Rice's judgment, entirely up to the Pacific coast producer to give strong support to the marketing associations on which rests his only hope of continued prosperity. Those who are not in the associations should get in, and all those who are in should do their best to produce and deliver eggs of the best quality.

Again he said: "The entire future of the rapidly growing poultry industry of the Pacific Coast depends absolutely upon the continued success of the cooperative egg marketing associations, which in turn depends upon the support given to these organizations by the poultrymen."

Poultry producers who have been members have stood the gaff and put up the money to support cooperative marketing, but there is so much of unfairness on the part of those who refuse to cooperate that the cooperators feel that they should have a measure of support from those who have disposed of their products in a way which has helped hammer the life and cooperative spirit of those who were endeavoring to uphold the industry. There are times when cooperation proves a testing of loyalty, public spirit and even permanent self interest.

It's easier to count the extra penny today, grab it and put it in the pocket than it is to stick with other cooperators and save the industry which means golden dollars—more comfort and competence. But while it's easier it is to be hoped that poultrymen not now cooperating will count the ultimate cost of their independence. Their productions are not simply an inert substance pushed out of the way as it is sold, for it then becomes a mighty club to beat the life out of the market into which cooperative eggs are thrown.

## IT PAYS

Does it pay to cooperate? We have tried many times to show wherein there may have been disappointment in minor matters of cooperation and wherein the immediate penny had been lost, but ultimately an industry had been saved. Further, that ultimately dollars have been directly saved because of the pennies temporarily lost. But here is an incident which shows direct action. The dollar saved has been immediate and satisfactory. It is only about $50,000 but that is a snug sum. And the fellows who are "holding the sack" are the winners.

W. T. Webber, sales manager of the California Walnut Growers Association, figures that the associated growers in that organization are $25,000 ahead, and R. L. Churchill, manager of the California Lima Bean Growers Association, estimates that the growers in that association are at least $15,000 to $20,000 ahead, because cooperative buying made it possible to lay in a supply of bags before the market took a jump.

Most of the burlap used by the walnut and bean growers is made from jute grown in India. This year the crop of jute was far below normal. Early in the year there was constant talk of a high import duty on jute. Everything indicated that the price would shortly advance sharply. When this fact became apparent, the California Walnut Growers Association and the California Lima Bean Growers Association laid in their supply of burlap bags for the fall harvest.

It looks as though the growers who market their crops cooperatively are about $50,000 ahead on bag buying alone, and they can charge this big saving up to the fact that cooperation put them in position to do their purchasing on a wholesale price basis. It goes without saying that the grower who markets his beans or walnuts independently has to buy his sacks from dealers at the current market price, and the dealer's selling price this year will be many notches above the figure at which the cooperative association bought its big supply a few months ago.

The California Fruit Growers Exchange has saved millions over a period of years in which it has owned lumber mills in the North. This through the making of its own box shook at prices less than half those demanded by lumber dealers. Manager Churchill of the Bean Growers says that association members get 60 cents out of the consumer's dollar, while it is stated that last year a lot of Lima bean growers sold to speculators and received only 36 cents of the consumer's dollar.

It pays to c-o-o-p-e-r-a-t-e.

## NEW MENACE

California is celebrating this week with great joy the installation of new steamship service between California and the Hawaiian Islands. The two steamers, "The City of Los Angeles" and "The City of Honolulu," are to give regular service between Los Angeles harbor and Honolulu. These steamers are said to be the finest on the Pacific. The initial trip of the "City of Los Angeles" is now being made with every berth filled and a waiting list for the Honolulu which is to leave a couple of weeks later.

While the rejoicing because of this extension of service is general those who know of the fruit growing conditions in the Hawaiian Islands and the fruit growing conditions in California are thinking of the added menace which this increased service brings to California orchards. The Mediterranean fruit fly and other pests, which have been kept from this state for many years, is now offered opportunity by this new service which has not obtained heretofore. Vessels in the past have nearly all entered the San Francisco harbor. The port there has been thoroughly guarded by a corp of eight or ten inspectors, besides conditions surrounding the harbor are not so favorable in its opportunities to perpetuate the fruit fly as they are at Los Angeles harbor. At Los Angeles harbor there are fruit trees almost within stone's throw of the vessels as they enter the harbor. The plant quarantine service is installed at present with only two inspectors, or rather, one inspector beside the quarantine official in charge. Of course when the big vessels in the Hawaiian service make their return trips other state quarantine officials, also the Los Angeles County horticultural commission, will aid in the inspection. Director Hecke is endeavoring in every way to put the service in the best possible condition and, so far as he can command the means, has succeeded most admirably.

The service should have the fullest support of the state in order that our fruit industry may be preserved.

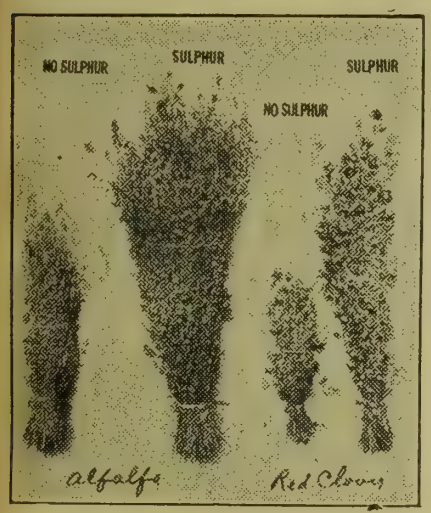
# Sulphur the Wonder Worker on Alfalfa

**Small Applications Give Enormous Increases on Many Western Soils**

Like begets like to a certain extent in breeding, but it was hardly to be expected that "yellow dust" from a sulphur mine would beget "yellow dust" in the bank. That's the way it appears to be working out for the alfalfa growers. The whys and wherefores aren't all worked out as yet, but the fact remains that increases of one thousand per cent have occurred and that those of one hundred per cent are common where sulphur has been applied to alfalfa.

Sulphur has long been accepted as one of the so called "essential" elements. Every one of them must be present in the soil in sufficient quantity if any crop is to make a normal growth. The trouble with sulphur was that every one thought there was plenty of it in practically all soils.

Almost over night chemists found out that their old methods of analysis were faulty, and that plants actually contained much larger amounts of sulphur than was previously supposed. It was just about as rude an awakening as a man with a joint bank account with his wife finding out that she had been spending one hundred dollars a



How Sulphur Increases Yield of Alfalfa and Red Clover.

week when all along he thought it was only twenty-five.

To carry the illustration farther, our rudely awakened husband starts investigating and finds that his wife has been spending it all along without his knowledge. He checks it up and finds that she can't get along on any less. He must either put more money in the bank or quit trying to support such a profligate wife.

Mr. Alfalfa Grower loves his crop like our friend of financial comparison loved his wife, and so he puts a little sulphur in his soil bank, rather than give her up.

The results of the use of sulphur in many instances sound more like fiction than sound agriculture, but the fact remains that in few instances has any sort of material been added to the soil that has resulted in so large net gains. To think of one hundred pounds of anything giving over one thousand pounds of something else makes you feel like claiming Missouri as your native state. And yet just such results have come from the use of the 'yellow dust' from Texas on alfalfa.

Sulphur as a plant food has a life history somewhat like ammonia. One has to be oxidized to a nitrate, the other to a sulphat. In both cases it is our unseen friends, the soil bacteria, that perform these specific tasks. How they do it is really another story, for it is the crop above ground that brings in the money, and in which the farmer is most interested.

What does sulphur actually do to the plant and to the soil? In the first place sulphur enters into the composition of the plant just the same as nitrogen or phosphoric acid do. If there is a lack of sulphur the whole plant is small in size, the leaves pale in color and the root system correspondingly ill developed.

In the soil it may operate directly or indirectly or as a soil conditioner, or all three combined. Where there is an actual poverty of sulphur in the soil or where the sulphur present is bound up in unavilable combinations the sulphur acts directly in supplying a definite need.

Again there may be no especial lack of available sulphur and the sulphuric acid formed in the soil through the oxidation of sulphur tends to liberate and render available other forms of plant food which cause increased growth.

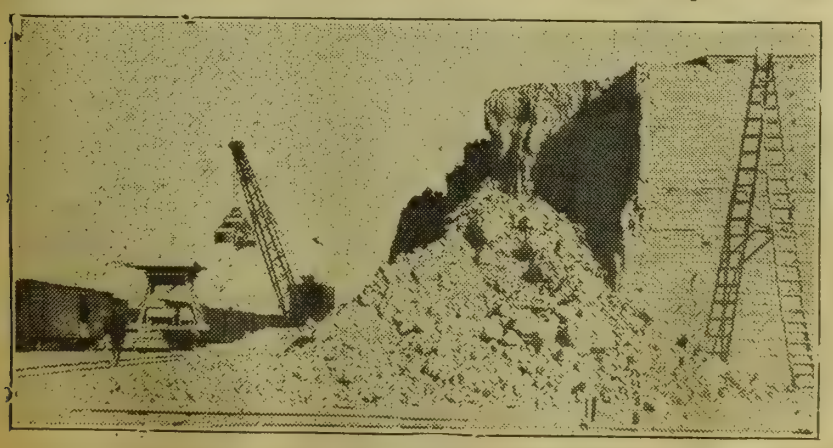
Many western soils give a pronounced physical response to the application of sulphur. Heavy adobe and gumbo soils are rendered granular and open. The soil becomes better ventilated and the activities of the soil bacteria are greatly increased. The tilth of the soil and its moisture absorbing capacities are altered so that the beneficial results of its application may be due to a combination of causes.

The source of the sulphur used in many of the tests has varied considerably. Acid phosphate, which contains its sulphur as calcium sulphate; gypsum, which likewise contains its sulphur as calcium sulphate; ammonium sulphate, iron sulphate and free sulphur have all been used. No doubt exists but that it is the sulphur in all of these materials that has given the uniformly good resuts. From the practical standpoint the use of free sulphur presents the greatest economies. Sulphur as obtained from the mines in Texas runs over ninety-nine and a half per cent pure. One hundred pounds of free sulphur is the equivalent of about six hundred pounds of gypsum, eight hundred pounds of acid phosphate or three hundred and fifty pounds of sulphate of ammonia as far as the content of sulphur is concerned. In most cases any of these materials are carried a considerable distance from the point of manufacture to the consumer, so that from the standpoint of freight charges, the pure sulphur is without competitor.

The residual effect, or the extent to which the influence is exerted over several years after the sulphur carrying materials are applied, is greatly in favor of the pure sulphur. Oft times the pure sulphur makes its most pronounced increase the second year. In this connection it may be that the use of inoculated sulphur, rather than the crude, will prove advantageous.

Sulphur applied to soils is changed over to sulphuric acid or sulphate before it becomes of benefit to the plant. Inoculated sulphur is richly impregnated with the bacteria necessary to perform this important work. Since many soils are not supplied with these organisms it would appear the part of wisdom to supply them by using inoculated sulphur. Experiments have shown that even where soils had a pronounced natural capacity for oxidizing sulphur that the inoculated sulphur was much more quickly converted.

In the east where sulphur is used extensively against potato scab the inoculated form gives much more uniform results and better control. Inoculated sulphur is essentially an agricultural product, designed for action in the soil, and carrying soil bacteria. In view of its universal superiority for agricultural uses it would appear the part of sound wisdom to use the inoculated sulphur on alfalfa.



Loading Sulphur at the Gulf, Texas, Mines of the Texas Gulf Sulphur Company, the World's Largest Producers of Sulphur. —(Adv.)

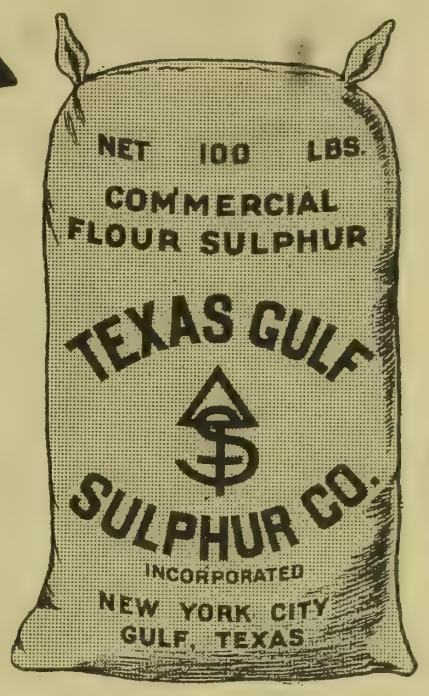
# "Best for Alfalfa"

# TEXAS GULF SULPHUR

(*Identify the genuine by this trademark*)

A better sulphur at a better price direct from the mines of the Texas Gulf Sulphur Co., the world's largest producers of sulphur. In order to fully serve the alfalfa growers in this territory we have established a warehouse in Portland, Oregon, from which we will make quick shipments of the genuine Texas Gulf Sulphur in any quantity. You will find the product, the price and the service right in every respect. No matter where you have been securing sulphur in the past you will find it greatly to your advantage to place your order with us this season.

*Contains 99½% Pure Sulphur*



*Packed in 100 lb. Burlap Bags*

## *Your Choice of Three Forms:—*

### *Crude Sulphur—*

Lump sulphur, 99½% pure, for those who prefer to do the grinding.
In bulk or 150 lb. bags

### *Flour Sulphur—*

Ground to extreme fineness, ready for immediate application to the soil. This product is so finely ground that it is in every respect equal to special brands for which high prices are commonly charged.
In 100 lb. burlap bags

### *Inoculated Sulphur—*

An exclusive Texas Gulf product. Specially ground flour sulphur inoculated with sure-acting oxidizing bacteria which make the sulphur quickly available for plant food. As commercial sulphur is apt to be inert in the soil and its full effects are usually not noted until the second season, we advise the use of Texas Gulf Inoculated Sulphur where quick action is needed, and especially for late applications. In any event, test it on an acre or two this season and compare results.
In 100 lb. burlap bags

### *Consult your County Agent*

We will gladly cooperate with him and with you in handling club orders. Naturally, you can save money by joining with your neighbors and making up a carload order.

### *Wire us at our expense—now!*

Send us a night letter, *charges collect*, tonight. Tell us your alfalfa acreage, the kind and amount of sulphur you will require, the name and address of your county agent or dealer. Address as below. We will promptly quote prices which will delight you.

*Our Sulphur Booklet and other helpful literature mailed free on request*

## TEXAS GULF SULPHUR CO.

# Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

### Grass for Uplands

I have a mountain ranch, 3700 feet elevation. We have as much as three feet of snow but it usually melts in from three to five days. The soil does not freeze deeply. The summer is cool; sometimes a shower of rain comes. I want a grass that will grow under these conditions. Can you give me information as to best grass, source of supply, amount of seed, cost, etc?—Subscriber, Reedley.

We believe Phalaris stenoptera, known as Harding grass, will best suit your land as it is a cold weather perennial. Prof. P. B. Kennedy, of the state university, recommends it highly as a grass that will keep growing when too cold for alfalfa to grow. Good reports come from many cold Upland sections. Any seed store advertising in the Cultivator can supply the seeds which will cost about $3.50 a pound, postpaid. Usually two to three pounds to the acre are sown any time during winter or spring. Bromus inermis, the Russian brome grass, and Paspalum dilatatum have both done very well under same conditions.

### Peach Scab

I am sending you a peach furrowed and pitted. Would like to know cause and remedy.—Subscriber, Reedley.

Possibly scab, see answer to similar question on page 232 September 2 issue.

### Roses and Basket Plants

When is the best time to move old roses, and should they be cut back heavily? What plants are most suitable in this climate for window boxes and hanging baskets each month or season of the year?—Subscriber, Santa Ana.

Old rose bushes to be moved should not be watered in July, August and September. Cut back heavily, to make a good stubby frame, about three or four weeks before removal, and keep soil dry. The precise time of moving is of far less importance than condition. If nearly dormant they may be moved any time from the present until one week after the first autumnal rain. Your second question does not "fit" the answer. Boxes and baskets are usually planted for permanency, not for a month or season. The latter would require a monthly list of plants and too much work for results obtainable. With such a program the plants in use in the garden at same season should be used, avoiding the large vigorous sorts. Annuals would be best and should be grown in small pots (2 inch) so as to transplant without shock. A change of plants in list would be necessary for either full shade or full sun. Any upright plants of conservative growth will do for general filling, but for trailers to droop over sides there is no better plant than Lotus peliorensis, a scarlet "parrot's bill" flower. Ivy geranium will do for large boxes or baskets. Break up stems of "Wandering Jew," punch holes in the basket with a lead pencil and push cuttings well in. They will grow and cover basket, or can be used for trailer in boxes.

### Leaf Eaters

I am enclosing leaves and a bud from my rose bushes. Some insects are eating the leaves. I have occasionally seen a medium sized pale green spider on the bushes. Please tell me what to do.—Subscriber, Pomona.

The injury is due to beetles (known as lachnosterna) which feed at night and hide during the day, therefore you do not see them. Entomologists state control measures are not satisfactory. The season of injury is very short, and the beetles are seldom present in large numbers; so that it seems of little use to combat them, but if present in considerable numbers spray with basic lead arsenate paste, 5 to 10 pounds; water, 100 gallons. Dry or powdered lead arsenate contains twice as much arsenic as the paste, therefore use only one-half as much in the above formula.

### Moving Large Lemon

I have a large lemon tree in back yard, which I wish to move. Please let me know if it is practicable and some instructions to follow, also time of year to do it. It would mean quite an experiment and I am willing to try it even should it fail. If not movable at this age, I will destroy it.—Subscriber, San Luis Obispo.

By any method, move in March. If boxing is not too expensive a four foot or five foot box should be used. Dig down and cut all side roots at once and fill back soil. Cut the bottom roots and move in March. The top should be reduced to a good framework before moving, with little foliage left. If moved with bare roots use method described in Culivator of June 24, 1922, as practiced on the Limoneira ranch at Santa Paula.

### Growing Peonies

Is it possible to grow peonies in the dry climate of California? Must they have a cool and shaded position? Our water is slightly alkaline. Will that harm? Is this the proper time of year to plant? What varieties would you plant?—Subscriber, San Marcos.

But one point need be kept in mind when handling peonies; the roots should be kept cool and moist. Treatment, position, everything should hinge on this. A deep, light, rich soil, full of organic matter is ideal, for it will best keep cool and moist. Peonies are quite tolerant of alkali. They need full sun. The best we have seen grew in sandy alkaline soil, a dozen miles from the coast, in an open house border on east side of building. Plant any time now. Varieties are of secondary importance. Whites seem to thrive best.

### Budding Peach Trees

I am budding a few hundred peach seedlings, two years old, to peaches. How soon can I unwrap buds and when should I cut off tree above the bud?—Subscriber, Highland.

Three weeks is about proper time to leave wrap before loosening or re-

The New Oakland Six

## The 1923 Oakland is Indeed The Ideal Farm Car

What other car, at anywhere near its price, even approximates the value of the New 1923 Series Oakland Six.

Visit an Oakland salesroom and examine its superior worth. Go over it point by point and your own sound judgment will convince you that here is automobile value without equal.

Note particularly its powerful, quiet, over-head valve, six cylinder engine, so good that *we guarantee its performance in writing for 15,000 miles.* See the unusually roomy body; the deep-cushioned, genuine leather seats. Examine the sturdy chassis construction—the deep frame, long buoyant springs, the size and strength of every moving part.

Consider the many unusual refinements that make country driving safer and more pleasant—the new dimming device, mounted on the steering wheel and controlled by the thumb while driving; the improved carburetor with automatic heat control; the door-opening curtains; the cowl ventilator and many other similar features.

These unusual features, coupled with the known high quality of its construction make this 1923 Oakland an ideal farm car—a car powerful enough to negotiate the roughest roads and the highest hills; sturdy enough to keep running year in and year out with a minimum of service attention; roomy enough for quick trips to market, loaded with grain or produce; economical enough in first cost and in maintenance to be practically indispensable.

The more carefully you examine this New Oakland, the more certain you will be to buy it—not upon our word, but because of its own high quality, quality almost unbelievable in a car that is sold for only $995.

moval, unless trees are growing very fast and tighten wraps too much. In this case two weeks only need elapse. Cut off trees next spring (probably in February) just as buds are beginning to swell.

# Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

### Blood in Milk

In the Cultivator, of August 26, we answered a question under the heading, "Blood in Milk," and since have received a communication from a friend giving his experience in several cases of that kind. He says: "I have cured three cows and know of two others being cured of giving bloody milk, and the remedy is so simple I think every one should know about it. Get a small package of poke root at any drug store and divide it into three doses. Give one dose in dry bran at each milking. Three or four doses are all that I ever use. More will not hurt the cow. If the cow will not eat it dry then steep it and use it as a drench. I had one cow that would not take it any other way but three doses cured her. I think the trouble is caused by a bruise of some kind." Such communications are always welcome and we thank the friend for his letter.

### Brain Trouble

About six months ago my 12 year old mare refused to work. She goes crazy when I put on the halter or harness. She is not blind but does not seem to see well. When in the field she walks slowly with her head between her legs. Has lost flesh. Can you suggest a remedy? Subscriber, Lincoln.

The symptoms would indicate pressure of the brain from some cause or other. If it is caused by a tumor there is no remedy. Congestion from some cause might be relieved by giving dram doses of bromide of potash in the drinking water once a day for a week. You might try that but if good results do not follow soon we would advise spending more time with her.

### Lump on Jaw

My milch cow has a hard lump forming under the left jawbone. It is the size of a small teacup. She is fat and eats well. Some needle grass on the pasture. Can you tell the cause and what I should do for it? Subscriber, Morgan Hill.

If the lump is free from the jawbone it may be due to the needle grass getting into the tissue, but if it is a part of the bone itself it may be what is called lump jaw (actinomycosis). If it is free from the bone open it. You will probably find it full of pus. Wash out the cavity with a solution of permanganate of potash. Use a teaspoon to the quart of warm water. If it is a part of the bone write us again, referring to this, and we will give you the treatment for lump jaw.

### Blister for Sidebone

Please print directions for blister for sidebone on draft horse. The horse is quite lame on hard road but works well and is fat. The lameness is in the front foot.—Subscriber, Butte County.

A good blister for sidebone can be made by mixing two drams of Spanish fly (Cantharides), two drams of biniodide of mercury and four ounces of lard. Warm the lard a little and mix thoroughly. When you rub on the blister, warm it in by holding a hot iron near the parts but not near enough to burn. Tie the horse so he can not rub the parts with his nose or he will get the blister on his nose. In 24 hours grease the parts with lard. When the scabs come off, which will be in about ten days, repeat the blister. Several blisters will be required to relieve the soreness in a sidebone.

# What to Expect of Paint

PAINT should serve you—prevent depreciation, save repairs, enhance values—for a long period of years.

It should be easy to apply, allowing a minimum labor cost. It should have excellent covering capacity.

Only the best paints can serve in this way. We have been making best paints for 73 years—to meet the weather conditions in the West.

Fuller's House Paints serve five or more years longer than "cheap" paints. They spread easily. One gallon will cover approximately 300 square feet, two coats, depending upon the condition of the surface.

They contain only the finest materials. We use PIONEER WHITE LEAD, for example. It is super-purified and ground so fine that it will pass through a silken screen which has 30,000 meshes to the square inch. All other materials—pure linseed oil, pure zinc and pure colors—are of the same high quality—the quality which is essential to the making of best paints.

**House Paint:** Fuller's Pure Prepared Paint, Phoenix Pure Paint, for painting houses. The purest, best protective and most durable paint manufactured—32 colors.

**Barn and Roof Paint:** A protective coating for barns, roofs, fences. Dries with a good gloss and wears. Economical in cost and dependable in quality—6 colors.

**Floor Paint:** Fuller's Rubber Cement Floor Paint—a sanitary, waterproof and durable paint for floors of kitchens, closets, etc. Attractive in color and gloss. Dries hard over night—12 colors.

**Implement Paints:** Fuller's Pacific Wagon Paint, adapted for repainting agricultural implements, farm wagons, farm machinery, wind mills. A glossy, durable finish—7 colors.

Also makers of Fullerwear, the all-purpose Varnish, Silkenwhite Enamel, Fifteen-for-Floors Varnish, Decoret, Washable Wall Finish, Auto Enamel, Fuller's Hot Water Wall Finish (kalsomine), Porch and Step Paint, Silo Paint, Milk Can Enamel, PIONEER WHITE LEAD, Tractor Paint, and Fuller's Oil Stains.

**Advice on Painting FREE**

If you want to do your own work and get the best results, ask our Specification Department for *free advice*.

We'll tell you how to treat old paint, how many coats to use, what kind of brush, etc.

Use *Fuller Service* as well as Fuller Paints and Varnishes to insure good work.

### HORTICULTURE AND ITS IMPLEMENTS ON DRESS PARADE

(Continued from Page 283)

tained special fancy work displays and painted china together with an assortment of jams and jellies. The exhibit of art work is presided over by Mrs. H. W. Adams of Sacramento. The paintings are by noted artists and the collection has a value of over $48,000. The first prize is from the Kanst Art Gallery of Los Angeles and is a $2500 picture entitled "Silver Light Laguna" by Edgar Payne. "The Blue Vase," a $1000 picture, and "The Vista," both by Sandona, received second award. A wonderful display of artistic camera work is participated in by all of the camera clubs of California. This camera work is artistic and so excellently done that it hardly seems possible the camera can render such efficient service.

The educational building contains an exhibit showing achievements of education. The shop work, done by the boys of the manual training school, is particularly creditable and includes cabinets, benches, chests, writing desks, tables, chairs, stools and many other useful articles to adorn the home. The department of household science and art gives the young housewife an opportunity to learn the art of decorating her home at a moderate cost. Basketry and metal work, dressmaking, millinery and practical needlework enable the housewife to save many dollars each year.

The poultry exhibit was one of the best we have ever seen. The main building occupies a space of over 5,000 square feet and each of the two annexes covers a space of over 1,000 square feet. While not all of the classes were filled, the birds on display were of a very high quality.

The automobile tent was the center of much interest. There were the latest models in about 15 different makes of cars. The Manufacturers Building is always one of special interest to the housewife, as it contains furniture, wall beds, cooking utensils in many metals, washing machines and electrical devices, household fittings for every room and sewing machines.

The state fair of 1922 was the best that has ever been held. It eliminated so many of the objectionable features and promoted so many advanced ideas that its educational value cannot be estimated.

### POWER ON THE FARM

By M. C. Holman

THE realization of our hopes came after we had made a careful inspection of that part of the state fair coming under the above heading.

The power on the farm exhibit was quite the largest of its kind that has ever been held in California. Three large tents were necessary to house the exhibits, and there was ground space on the outside that was given to the overflow that could not find a berth in one of the main tents.

Fourteen separate sets of tractors were shown, each set containing from three to six different models. There were 46 separate exhibits in the main tents and five of the larger exhibits had to be accommodated outside.

So that the tractors could be very easily and thoroughly inspected, many of the engines and working parts were entirely exposed and some were even propped up at an angle, with a mirror underneath, to show the working of the parts that are ordinarily concealed but which bear so important a part in the durability and ease of running of the entire machine. There was a desire to exhibit the tractors to the fullest extent, showing that the manufacturers have confidence in the machines they make and feel sure that the purchasers will derive from them the very fullest measure of service.

Like a circus, the great tent was festooned with banners, bunting and flags. Sawdust covered the ground, railings marked off the allotted spaces for the various machines, and the whole atmosphere was one of intense excitement and keen interest.

There was a sense of homelikeness when we observed the old standbys that have made California the greatest agricultural and horticultural state in the Union. We were proud to look upon them in repose. We have seen them so many times proudly turning up the richness of our native state that to see them at their much deserved rest was an unmixed pleasure.

Just at the entrance stood the great Holt exhibit and a feature never before shown was given its first tryout. It consisted of assembling and disassembling of the T 35. On a test of disassembling, or taking down, two men did the complete job in 14½ minutes, laying the parts separately upon the platform. The assembling was done in 26½ minutes. The object of this feat was to demonstrate the accessibility and simplicity of their tractor. It is built in three main units; the motor, transmission and tracks. The demonstration above referred to showed the assembling and disassembling of each part, together with its relation to the whole machine.

This year Holt has placed upon the market a new combined harvester, having all steel equipment, roller bearings, simple construction and light draft. There are two models, No. 32 of 12 foot cut and No. 30 with a 16 foot cut.

These new harvesters are light in weight, with the body of sheet metal. They are light draft, made so by the use of auto friction bearings. They are easy of operation as a result of their simplicity and should give a lifetime of good service by reason of the use of highest grade material throughout.

The big 75; Western ten ton, 60 horsepower; the 5 ton 40 horsepower and the T 35 of 20 horsepower were included in the exhibit.

The Best 30 was admirably represented by two old models that had given two years of faithful service and were still in the ring. They are

BECKWITH FIG TREES

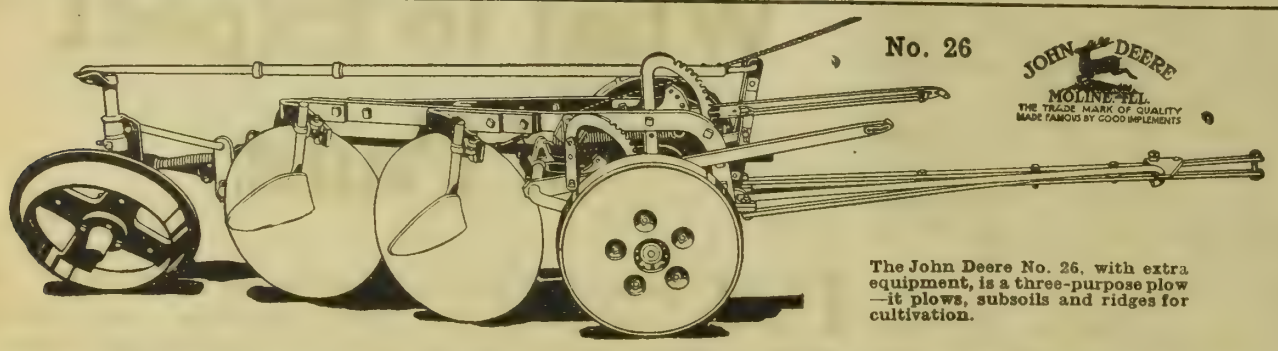
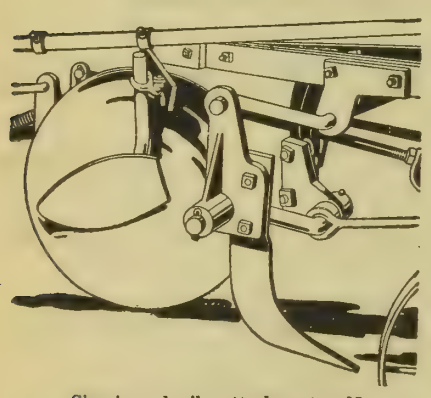
Beckwith-Hoyer Nursery Drawer 308, Reedley, Calif.



The John Deere No. 26, with extra equipment, is a three-purpose plow—it plows, subsoils and ridges for cultivation.

26 Inches Low—37 Inches Narrow



Showing subsoiler attachment on No. 26 Plow. Replaces one disc. Controlled by power lift. Permits plowing and subsoiling in one operation with small tractor. Subsoiler breaks up plow pan and forms deep bed of aerated mulch—a process that saves much irrigating water and greatly increases crop yields.

Gets Under Low Limbs, Up Close to Row

Unusually low and narrow, the John Deere No. 26 is just the plow you have been needing to meet your orchard plowing requirements.

It works under the overhanging limbs; the levers set down out of the way; no projections above or at the side to catch low limbs or scar tree trunks, and the hitch permits wide offset to right or left of tractor for work close to row.

**Stiff hitch** tends to hold plow in the furrow when offset, and its control of the rear furrow wheel makes possible short turns and close work at ends of orchard.

**Saves roots** — rear end of plow rises over roots without carrying weight of rear wheels, when set-screw collar on rear axle is left loose. You will appreciate the way this feature prevents damage to large roots.

**Does Three Orchard Jobs.** You can plow, subsoil or make ridges for irrigation with the No. 26. Note illustrations showing subsoiler and ridging attachments.

Compound power lift raises discs unusually high. Frame built over discs, providing unusual clearance. Discs and disc bearings same as on large John Deere disc plows.

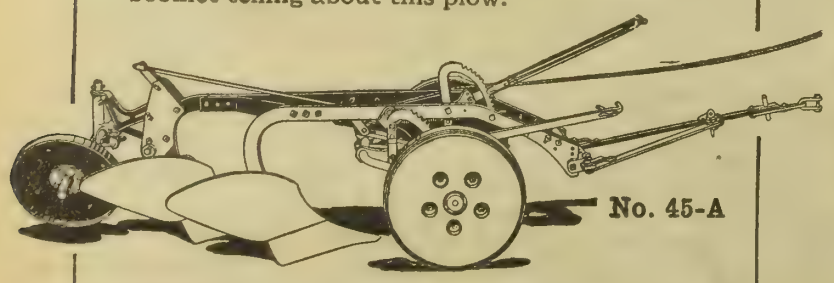
**GET FREE BOOKLET** telling all about the No. 26. Write today—ask for Booklet A-46.

John Deere Plow Co.

San Francisco, Cal.

John Deere No. 45-A

Low and narrow like the No. 26 — only twenty-six inches high when plowing six inches deep — only thirty-seven inches wide. Levers set low when plowing — gets under low limbs. Adjustable hitch permits offsetting plow for work close to row. Pulls unusually light—a real fuel-saver. Great strength — beams are guaranteed not to bend or break. Compound power lift raises bottoms unusually high. Great clearance prevents clogging when plowing deep or when turning under cover crops. Write today for free booklet telling about this plow.



Showing No. 26 with ridging attachment preparing soil for proper irrigation. Attachment costs very little and does away with necessity of buying extra implement for ridging.

JOHN DEERE

THE TRADE MARK OF QUALITY MADE FAMOUS BY GOOD IMPLEMENTS

owned and operated by the California Packing Corporation. A complete record has been kept of these tractors when in operation and their record shows the following interesting facts for the seasons of 1921 and 1922.

| | |
|---|---|
| Number of hours running | 1509 |
| Number of acres worked | 6645 |
| Gallons of distillate used | 4112 |
| Gallons of lubricating oil used | 221 |
| Cost of repairs | $21.31 |
| Cost of operation per acre | .26 6/10 |
| Cost of operation per hour | $1 22 3/10 |

The low cost of repairs is a feature worth considering and the cost of operation per acre is quite remarkable.

The new and improved Best 60 shows a pull of 49.5 horsepower at the drawbar with an average load of 7,500 pounds, when traveling at the rate of 2.47 miles per hour, while in low at two miles per hour it pulled an average of 9,280 pounds.

The powerful Best 60 handles successfully all work pertaining to scarifying, leveling, grading, ditching, hauling, belt work and other heavy duty jobs. The success of the Best 60 in road building is due to its wide adaptability, low up-keep, economy and ease of operation. The 60 can be operated under the most adverse conditions, such as soggy land, steep hills, deep mud, loose earth, hard surface, etc., with full load.

The Yuba exhibit featured a tractor completely exposed, showing all working parts. The reversing feature is strongly urged as having great merit. The tracks may be made to run in opposite directions at the same time, thus enabling the tractor to turn on a pivot. The highest grade of nickel chrome, manganese and high carbon steel are used in all wearing parts, giving durability of a high order.

The ability of the Yuba tractor to work successfully under extremes of soil and weather conditions is largely due to the character of its tracks. They are swung from the main axle at a point about one-fifth the distance from the rear and oscillate on powerful vanadium springs, and are protected against sand and dirt.

The model known as the Road Builder is 25-40 horsepower, while the smaller model is the 15-25.

A tractor that is rapidly coming into prominence is the H. P. 40 made by the Hadfield-Penfield Company of Bucyrus, Ohio, and sold in California by the Pacific Tractor and Machinery Company, of Sacramento, formerly the Henneuse Tractor Company. Their first tractor, a Henneuse 40, made at Sacramento in 1920 is still in use and in perfect running order.

The power plant of the H. P. 40 consists of a Stearns engine having a five inch bore and a six and a half inch stroke. It has a hot box manifold and is especially designed for burning kerosene. The transmission consists of an entirely separate self contained unit securely bolted to the frame and to the engine flywheel housing. The engine clutch is the dry plate type and is controlled by a double acting pedal.

The distribution of the power to the tracks is controlled by two multiple disk clutches running in oil, one for each track. Each clutch is operated by a hand lever, one being mounted at the right and the other at the left of the gear shift lever. A light forward pressure on a lever engages the corresponding clutch. Pulling a lever back releases the clutch and applies a brake to the track on that side. The front wheel turns on a ball bearing circle of large diameter. The H. P. has a rating of 45 horsepower at 850 revolutions per minute.

The same exhibit also contained their H. P. tracks, which are made for use with small wheel tractors. They enable them to operate on wet, soft roads and in deep sand as well as over rough, hilly ground.

A very prominent space was used by the Cleveland Tractor Company in showing their new model F, together with their old standard line. Simplicity of design has marked this new model. While it weighs only 1820 pounds, it is capable of hauling two 12 inch plows in any ordinary soil, turning over six to eight acres a day.

The engine is a 4 cylinder L head type with 1600 revolutions at a speed of three miles per hour. The whole machine is a snappy little job, with lots of power and plenty of stamina and economy of operation. It has an automatic lubricating system, which will be appreciated by the operator. Just occasionally fill the oil supply reservoir and you need have no further worry about proper lubrication.

The new Case 12-20 was much admired as it marks another advance in supplying dependable power farming machinery of the highest possible efficiency.

This tractor will develop at least 24 to 25 horsepower on the brake, maximum. It will handle a 22 by 36 thresher with attachments in ordinary threshing. It will operate a No. 12 or 14 silo filler, elevating to the average silo. It will develop as high as 16 horsepower on the draw bar, on good ground. It will easily handle three 14 inch plows under ordinary conditions, plowing 7 inches deep. In breaking or in heavy plowing two 14 inch bottoms are recommended. It will handle an 8-foot double disk in high gear in the average field. It will also pull a 12-foot grain drill and an equal width of harrow in high gear.

Power is transmitted from the engine crankshaft to both drive wheels with minimum loss through a train of cut steel, hardened spur gears running in oil. The gear shafts run in large Hyatt roller bearings so that the friction loss is slight. Bearings are contained in the frame casting, making it impossible for them to get out of line. The transmission cover can be readily removed, giving access to transmission. The sliding gears in transmission are of chrome steel, drop forged, cut and hardened. The high and low speed gears are drop forged with cut teeth. The shaft which carries these two gears also carries the bull pinion and runs in large Hyatt roller bearings. The bull pinion is drop forged of chrome nickel steel. This pinion meshes with the bull gear which is likewise of steel with machine cut teeth. All gears are properly treated

(Continued on Page 298)

# I CAN TELL YOU JUST WHAT YOUR FENCING SHOULD COST

HARRY BAYLIES
"The Fence Man"

"Fencing Products Known To The Nation."

Many farmers when they start to build a fence have no idea what it is going to cost them. True enough, they know what the actual material will cost, but when it comes to the question of time, labor, and length of fence service, they are all at sea. I can tell you within a few dollars what the complete job should cost, AND HOW much your fence should COST PER YEAR; which is the way to figure and the only way to buy fence material.

Ask any dealer about my steel fence materials. He will tell you they are the strongest, most durable, most economical materials you can use. They are known throughout America—RED TOP STEEL FENCE POSTS, PACIFIC STIFF-STAY FENCING, MONARCH WRAP-STAY FENCING and SQUARE DEAL GATES.

These materials carry not only the guarantee of reliable well known manufacturers, but they carry also my personal guarantee—any of my many farmer friends will tell you what THAT means. THEY KNOW THAT I LIVE UP TO EVERY CLAIM I MAKE.

Send for my free book, "Fencing Facts for Farmers," it will show you how to find out just what your fence should cost and how you can save money. It is chock full of other valuable information for the farmer. EVERY MAN WHO OWNS A FARM SHOULD HAVE THIS BOOK. Fill in the coupon for this free, interesting illustrated book.

Radio

The Greatest Radio Offer of the Year—Absolutely Complete, $49.50

This special receiving outfit will give as good results as any outfit of this improved type on the market. It is absolutely complete, there is nothing extra to buy. We include everything—you simply put up the aerial, connect the instruments, which is easy to do, and in less than half an hour you can be receiving signals, radio music, lectures, stock reports, market reports, or any other radio program sent out.

In making tests with this set in Chicago we regularly heard Detroit, Pittsburgh and other stations were often tuned in. Of course, atmospheric conditions affect the range of this or any other receiving set made.

Highest Development in Radio Receiving

This outfit will equal in results any outfit of this type regardless of price. It is especially made for us and has behind it the fifty year old guarantee of Montgomery Ward & Co.: "Satisfaction guaranteed or your money back." You take no risk whatever in ordering this set.

Long Distance Vacuum Tube Receiving Set

The complete outfit includes our special Combined Tuner and Detector; Special 2000 ohm Double Head Set; Radio Storage Battery; one Detector Tube, one "B" Battery; and complete antenna and connecting equipment including 150 feet bare copper wire and 25 feet insulated wire, porcelain tube; double throw switch; 2 antenna insulators; lightning protector; ground clamp, 2 screw eyes and 25 feet of wire for instrument connections.

Order this set at our risk. It will be packed carefully and shipped immediately from our nearest house.
Shipping weight 40 pounds.
563Z599—Complete Outfit..... $49.50

Order this outfit today and start at once enjoying in your home the most marvelous invention of the age.

Price of receiving Set without batteries, head piece, switch and aerial, shipping weight 8 pounds: 563Z598—$27.50.

Send money order or check to the one of our five houses that is nearest to you.

### IN DEFENSE OF NELLIE

Eatin' her head off, is she;
Too old to be any good;
If you was me, you'd sell her?
Mebbe you would!

You and your derned machinery;
Grease it and make it pay,
Use it 'til it begins to wear—
Throw it away!

Mebbe your way is business;
That's nuther here nor there;
I ain't a-talking business;
That's my mare!

When I bought this place, I got her;
She helped to clear this land;
And she carried me to see your mother—
D'ye understand.

And I'm never gonna sell 'er,
Nor either give her away,
And she'll get her oats, young feller,
Twice a day!—R. L. in Extension Service News.

### HINTS FROM HOUSEKEEPERS

#### Recipes and Suggestions

The enclosed recipe for Swiss cookies was asked for in recent Cultivator and this one for Brioche some months ago by "A Mother" whose boys were "Over There." I hope she will see this recipe and make the boys happy by giving them the real "Brioche a la France."

Swiss Cookies—One pound flour, one-half pint milk, 3 ounces butter, 1 egg, 2 ounces sugar, pinch of salt, 1 tablespoon baking powder. Rub butter into flour, add sugar and baking powder (rubbed through a sieve), mix into a light dough with egg and milk. Roll out and cut into small rounds, brush over with egg and bake 10 minutes in quick oven.

Brioche—One cup scalded milk, ¼ cup egg yolks, ½ cup whole eggs, ⅔ cup butter, ½ cup sugar, 2 yeast cakes, ½ teaspoon extract lemon, 4⅔ cups flour. Cool the milk, when lukewarm add yeast cakes. When they are dissolved add the remaining ingredients and beat thoroughly with the hand for ten minutes. Let rise for six hours. Put in cold place (preferably ice box) over night. In the morning turn on floured board, roll in long rectangular piece, spread with melted butter, fold from side to side to make three layers. Cut off pieces three-fourths inch wide, leave on board in warm place, cover and let rise. Take each piece separately and twist from ends in opposite direction, coil and bring ends together on top of cake. Let rise in pans and bake in moderate oven for 20 minutes. Brush over with powdered sugar moistened with water. The making of brioche is quite a ritual in France, and even the poorest homes will make them on feast days—Easter and Christmas. They should turn out like puff paste rather than coffee cake.

Boiled Salad Dressing—One-third teaspoon salt, ½ tablespoon flour, 1 teaspoon mustard, yolks of 2 eggs, 1½ tablespoons sugar, 1½ tablespoons butter, few grains cayenne, ¾ cup milk, ¼ cup vinegar. Mix dry ingredients, add yolks of eggs slightly beaten, butter, milk, and vinegar very slowly. Cook in double boiler until thick. If lumpy strain, cool and keep in jelly glasses or empty olive or mustard jars. Covered with wax paper it will keep a long time.

Keeping Butter—Cleaning Windows—A little hint on how to keep butter cool may come in handy. Soak a large size flower pot in cold water over night and in the morning tilt it over the butter dish. The easiest way to clean windows is to wipe over with powdered Bon Ami moistened with water and rub off with a rag and polish with another. No effort, no smears and windows can be cleaned any time with the sun on them or not.

Tile Sink—A tile sink is the very least of any to be serviceable, for it breaks more dishes than any other, besides getting cracked, and greasy looking.—Mrs. W. Rogers, Biggs.

#### "Drying" Figs

I am drying figs in this way and they are fine. I make thick syrup and after boiling it for a few moments I drop in figs so the syrup will cover them, then cook for 15 minutes. Set aside and cook next day 15 minutes after boiling point. Take out with fork and put in colander to drain, then lay on plates to dry and keep in sun for five or six days, then take them in and let set inside a day or so. Put in jars and put lids on them. These figs are picked a little solid and used as picked with skins on. They are fine this way. This is a recipe of my own.—Mrs. R. S. Vliex, Orange.

#### Making Old House Comfortable

Have just been reading "Subscriber, Woodlands" letter in issue of Sept. 2. I had just such a house. I saw one that had been papered by putting cheesecloth next the boards, but my walls had 2 by 4 pieces of lumber standing out into the room on the walls. I tacked burlap, stretching from one 2 by 4 to another and tacking a thin wood strip over the seams. It was a dark room and I put on an almost orange color and it was very satisfactory indeed.

For a floor, French gray paint is a fine color which does not betray dust. It is fine to have so much expert advice about painting. Please keep it up. I have put a commercial varnish stain in French Gray on much of our shabby furniture and it looks very well and is very serviceable where one has not much time for cleaning.—Subscriber, El Centro.

### HOUSEHOLD QUERIES

#### Watermelon Pickles

Please publish recipe for making watermelon pickles in the Cultivator.—Subscriber, Livermore.

Two very good recipes are given on Page 204 of the Cultivator of August 26. No doubt the inquirer overlooked them.

#### Tomato Catsup

Would you kindly publish a recipe for making tomato catsup? The Cultivator is very helpful along this line.—Subscriber, Livermore.

Directions will be found on page 85 of the Cultivator of July 22. Copy has been mailed this inquirer.

#### Canning Egg Plant

Has anyone ever tried canning egg plant? I would like to put up some if they are good.—Subscriber, Ceres.

We pass this up to our readers.

#### "Take Good Care of Baby"

I am very anxious to get a poem that I used to know. Will you kindly print it in the Cultivator for me? It is entitled "Persimmons." I do not know the author. It commences like this:

"Persimmons was a colored lad
Way down in Louisianny,
And all the teaching that he had
Was given him by his Granny."—Subscriber, Arroyo Grande.

The title to the poem requested is "Take Good Care of Baby" instead of "Persimmons."

#### "TAKE GOOD CARE OF BABY"

Persimmons was a colored lad,,
Way down in Louisiana,
And all the teaching that he had
Was given him by his granny;
But he did his duty ever,
As well as you, it may be;
With faithfulness and pride always
He minded missus' baby.

He loved the counsels of the saints,
And sometimes those of sinners—
To run off 'possum hunting and
Steal "watermilyun dinners;"
And fervently at meeting, too,
On every Sunday night,
He'd with the elders shout and pray
By the pine knots' flaring light;
And sing their rudest melodies
With voice so full and strong,
You could almost think he learned them
From the angels' triumph song.

SONG

"We be nearer to de Lord
Dan de white folks—and dey knows it,
See de glory gate unbarred,
Walk in, ,darkies, past de guard;
Bet you dollar he won't close it,
Walk in, darkies, troo de gate,
Hear de kullered angels holler,
'Go 'way white folks, you'se too late,
We'se de winning kuller; wait
'Till de trumpet blows to foller.' "

He would croon this over softly,
As he lay out in the sun,
But the song he heard most often,

## Oil Light Beats Electric or Gas

### BURNS 94% AIR

A new oil lamp that gives an amazingly brilliant, soft, white light, even better than gas or electricity, has been tested by the U. S. government and 35 leading universities and found to be superior to 10 ordinary oil lamps. It burns without odor, smoke or noise—no pumping up, is simple, clean, safe. Burns 94% air and 6% common kerosene (coal oil).

The inventor, W. V. Johnson, 31 N. Fifth St., Portland, Ore., is offering to send a lamp on 10 days' FREE trial, or even to give one FREE to the first user in each locality who will help him introduce it. Write him today for full particulars. Also ask him to explain how you can get the agency, and without experience or money make $250 to $500 per month.

## WESTERN CANADA for Big Wheat Crops

**Canada is the world's greatest producer of wheat—second only to the United States—yet only about 12% of the tillable area has been worked. Yields of 40 bushels of wheat per acre are not uncommon.**

Oats have given as high as 100 bushels per acre, while 40 to 50 bushels per acre are ordinary yields; barley and rye in like proportion. Cattle and horses thrive on the native grasses which grow abundantly and corn and sunflower culture are highly successful.

### Stock Raising, Dairying and Mixed Farming

secure for the industrious settler ample returns for his energy. Clearing the cost of one's farm with a single year's crop has an appeal, and has been done by hundreds of Western Canada farmers. Taxes only upon land (not on improvements). Perfect climate, attractive social conditions, good neighbors, churches, schools, telephones, excellent markets and shipping facilities make life happy as well as prosperous.

For illustrated literature, maps, description of farm opportunities in Manitoba, Saskatchewan, Alberta and British Columbia, reduced railway rates, etc., write to

GILBERT ROCHE.

PACKERS OF AIR LINE HONEY

Extra parts are always available without delay for standard advertised machinery. This class always found in the California Cultivator.

His granny's favorite one,
Was: "Gawge Washington
Thomas Jefferson
Persimmons Henry Clay, be
'Quick, shut de do,'
'Get up off dat flo,'
'Come here and mind de baby.' "

One night there came a fearful storm,
Almost a second flood,
The river rose, a torrent swollen,
Of yellow, beaten mud.
It bit at its embankments,
And lapped them down in foam,
Till, surging through a wide crevasse,
The waves seethed round their home.
They scaled the high veranda,
They filled the parlors clear,
Till floating chairs and tables,
Clashed 'gainst the chandelier.

'Twas then Persimmons' granny,
Stout of arm and terror proof,
By means of axe and lever,
Pried up the veranda roof,
Bound mattresses upon it,
With stoutest cords of rope,
Lifted out her fainting mistress,
Saying, "Honey, dar is hope.
"You Gawge Washington
Thomas Jefferson
Persimmons Henry Clay, be
Quick on dat raf,
Don't star' like a calf,
But take good care ob baby."

The frothing river lifted them
Out on its turbid tide,
And for awhile they floated in
Together, side by side,
Till, broken by the current strong,
The frail raft snapped in two,
And Persimmons saw his granny
Fast fading from his view.
The deck hands on a steam boat
Heard, as they passed in haste,
A child's voice singing in the dark
Upon the waters waste,
A song of faith and triumph,
Of Moses and the Lord,
And throwing out a coil of rope,
They drew him safe on board.

Full many a stranger city
Persimmons wandered through,
"A-totin' ob de baby," and
Singing songs he knew.
At length some City Fathers,
Objecting to his plan,
Arrested as a vagrant
Our valiant little man.
They carried out their purposes;
Persimmons " 'lowed he'd spoil 'em;"
And sloping from the station house,
Stole baby from the 'sylum.
On that very afternoon,
As it was growing dark
He sang beside the fountain,
In the crowded city park,
A rude camp meeting anthem
Which he had sung before,
While in his granny's fragile raft
He drifted far from shore.

SONG

"Moses smote de water, and
De sea gabe way,
De children passed ober, for
De sea gabe way.
O, Lord, I feel so glad,
It am always dark fo' day,
So, honey, don't be sad,
De sea'll gib away."

A lady dressed in mourning
Turned with a sudden start,
Gave one glance at the baby,
And caught it to her heart,
While a substantial shadow,
That was walking by her side
Seized Persimmons by the shoulder
And while she shook him, cried;
"You, Gawge Washington
Thomas Jefferson
Persimmons Henry Clay, be
Quick, 'splain yourself, chile,
Stop dat ar' fool smile,
Whar you done been wid baby?"—St. Nicholas.

### "Them Is the Cruelest"

Of all sad words that make men blue,
The saddest are these: "The rent is due."

—Milwaukee Sentinel.

"The rent is due"—sad words, we know,
But sadder are these: "We're out of dough!"

—S. F. Chronicle.

---

### OR ELSE "WHAT?"

Questionnaire issued by the University of Wisconsin includes this query: "Is Ireland a republic, a free state, a dominion, or what?" Obviously, the answer to this at the present time is "Yes"—(Boston Transcript.

## The Cap that never fits

"NO harm can come to *me* from coffee or tea," is what so many people say. Yet those same people are often quick to note the signs of coffee harm in others.

How familiar the danger signals are—upset digestion, sleepless nights and irritability—all warnings of the nervous breakdown that lurks just a little way ahead. How easy and how delightful the escape—by drinking delicious Instant Postum instead of the beverages that contain the irritant caffeine.

Instant Postum is the tempting cereal drink made from roasted wheat. It is prepared instantly in the cup by the addition of boiling water. Its snappy flavor is not unlike that of coffee.

It is safe for everybody in your household including the children, and there's nothing in Postum to keep you awake even if you drink it at midnight.

## THE AUTO-OILED AERMOTOR

### A Real Self-Oiling Windmill

*A year's supply of oil is sent with every Aermotor*

Oil an Aermotor once a year and it is always oiled. Every moving part is completely and fully oiled. A constant stream of oil flows on every bearing. The shafts run in oil. The double gears run in oil in a tightly enclosed gear case. Friction and wear are practically eliminated.

Any windmill which does not have the gears running in oil is only half oiled. A modern windmill, like a modern automobile, must have its gears enclosed and run in oil. Dry gears, exposed to dust, wear rapidly. Dry bearings and dry gears cause friction and loss of power. The Aermotor pumps in the lightest breeze because it is correctly designed and well oiled. To get everlasting windmill satisfaction, buy the Aermotor.

*Aermotor Towers are Towers of Strength*

*Write today for Circular.* AERMOTOR CO. Chicago Kansas City Des Moines Minneapolis Oakland

LIVESTOCK SALE CALENDAR

Holsteins

September 21, Dispersal, E. Maracini, Dos Palos.

September 28, Dispersal, Carl Ray, Lankershim.

October 26, C. W. Anderson, Burbank.

November 16, Dispersal, Arthur & Maxfield Holstein Co., Hanford.

There was a large attendance of Holstein breeders on Monday when their favorite breed was being judged. The meeting of the state association which was held that evening also acted as a drawing card.

It looked at first as though there might be trouble because the state fair board had not come out definitely and said that only tuberculin tested animals could be shown. Men who have tuberculin tested herds feel that they should not be called upon to use the same barns with cattle of which there is a doubt and they are right. The state department of agriculture is fighting tuberculosis in cattle tooth and toe nail and it is up to the fair board to back them up by refusing to admit animals which are not accompanied by a certificate from a recognized veterinarian guaranteeing them clean. Riverside and Pomona have come out for tuberculin tested animals in no uncertain words and the state fair—which should have been the leader—should be quick to get into line. If this is not done there will be a number of herds missing next year.

The Holstein show ring was interesting in show men as well as animals. Many old timers, some of whom have national reputations, were holding the cattle. Pete Ledgaard, who has shown all through the East for the Maxwell Farms, was in charge of Hartsook's herd with Dick Ulken, Earl Sturgis and Harry Redd to help show it. Johnny Dugan was with the Millbrae herd, and Jack Shillcock helped the Junior Republic boys. Harry Wilson, formerly with Schroeder and later with Bridgford, has charge of the Berylwood show string. With a multitude of tip top animals and these boys to show them the ring took on the appearance of a national show.

Fred Hartsook's Toggenburg milk goats won 77 per cent of the money offered for that division. His nine quart doe, El Chivars Helenka, was senior champion.

The American Jersey Cattle Club exhibit occupied a separate tent and was in charge of Mr. Astroth, who represents the club on the coast.

E. L. Westover, the western field man for the Guernsey Cattle Club, was present all week.

Alfred Elliott, who was showing the Poland China herd owned by the Tagus Ranch, bought the first prize junior yearling boar, Westerner C, from Starlock Farms. He will use him on a few fine gilts which he reserved when he sold his herd.

Mrs. Charles Virden of San Francisco, bought the great senior yearling Berkshire sow, Festline's Rival 2d, from Alex Wilson of the Italian Vineyard Company. This sow was first in her class and was reserve grand champion sow, being beaten by her dam Violets Festline, who has never been defeated. Mrs. Virden arranged with Mr. Wilson to have Festline's Rival 2d shown at Riverside, Pomona and Portland before being shipped to her.

Judges Painter and Patterson, who handled the beef cattle, were exceedingly well pleased with the animals on which they passed judgment.

The Dairy Shorthorns were judged under the new classifications adopted last year by the national association. They are entirely different from the regular classifications used by the other breeds. Thos. Harrison showed both grand champions and junior champion bull. Innisfail Betty, junior champion female, was shown by J. D. Rowe & Sons.

## STANISLAUS COUNTY CALF CLUB

Thursday, August 17, everyone had an opportunity to see the class of Jersey cattle bred and raised in Stanislaus County, the breeders and the calf club holding a great parade. The calf club members each led his own calf. Frank B. Astroth, field man of the American Jersey Cattle Club, judged the calves after the parade, the winners to go to the state fair. The parade was headed by police escort, then the boys' band, next Mayor Ulrich and John Dillon, secretary of chamber of commerce, also Mr. Astroth and County Agent A. A. Youngerman, while Frank Spurrier, assistant state leader of the extension department of agriculture of the University of California and Assistant Farm Advisor Donald Smith escorted the calf club members with their calves. Next were the breeders. The club winners were:

Junior yearling heifer—1, Elmo High; 2, George Gilman; 3, Daniel Conant.

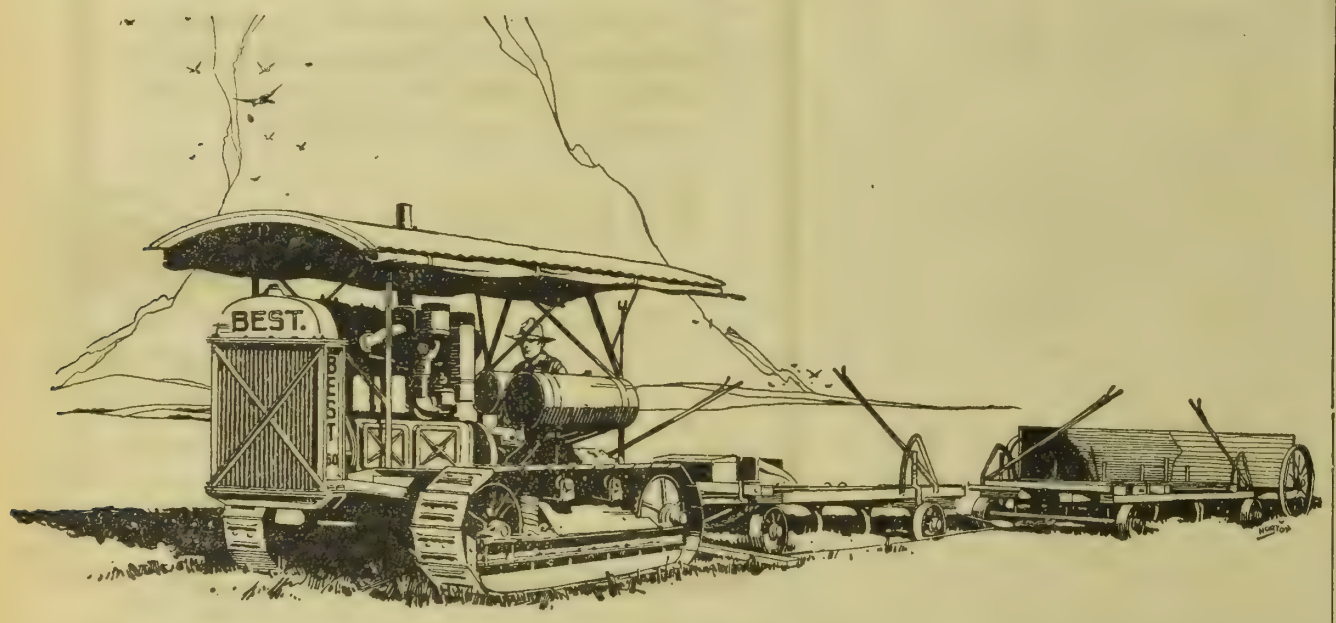
Heifer in milk—1, Marguerite Conant; 2, Jesse Henry; 3, Jewel Campbell.

Heifer and calves under one year—1, Jonk Mier; 2, Jesse Henry; 3, Bertha Mier; 4, Ruth Wilson; 5, Jack Sampley.

Grand champion, Marguerite Conant, heifer in milk Reserve champion, Elmo High with heifer over one year.

At Modesto high school auditorium at 8 p. m., with Guy H. Miller as chairman, George T. McCabe, secretary of Stanislaus County board of trade was introduced as first speaker. He spoke on the dairy industry in early times and down to date. Frank Spurrier of the University spoke to the calf club members. Then followed the stereopticon lecture by Mr. Astroth, the field man. He had slides with all the famous registered Jerseys. Their records of butterfat, pedigrees and type were explained. The advantanges of raising Jerseys in comparison with other breeds were explained, also the low cost of producing a pound of fat alongside of some other breeds were depicted on the slide.

The committee from the breeders association was composed of W. J. Hackett, Guy H. Miller, J. A. Goodall, D. F. Conant, C. L. Jarrett and C. D. Hayworth, and from the calf club Elmo High, Dan Conant, George Gillman, Jesse Henry, John Mier and Gordon Campbell. The mayor of Modesto, the chamber of commerce and the county board of trade did all they could to make it a great day, the chamber of commerce paying for the prize ribbons.—C.



What will a Tractor do?

If it's a Best Tractor it will do almost any power job and do it well—day in and day out—year after year—with a minimum of upkeep and depreciation.

Good tractors are one of the outstanding factors in increasing yields for the farmer. Plowing, cultivating and harvesting can be done so fast and so thoroughly, and with fewer hands, that the saving is the difference between profit and the even break. Then there are the numerous in-between jobs on all of which the Good tractor more than pays its way—in fact many Best owners have found a very profitable business in doing road and general contract work between seasons.

Best Tractors are not only a good investment this year; their long life and dependability keep them in service for many seasons, so that the first cost is spread out over several years, each year paying a profit.

Best Tractors are more than a combination of metals shaped and fastened together to specifications drawn to meet a price. They are the product of years of experience in building *successful tractors.* Experience that has developed a correct and balanced design—that has taught the use of special heat treated steel here—drop forgings there—anti-friction bearings at other places and so on. Just as a clean limbed horse comes into the thoroughbred class through careful breeding and rearing over a period of years—so Best Tractors have reached the top of tractor perfection.

There are two models of Best farm tractors, the "Sixty" and the "Thirty," Let us send you full information on both and the name of our nearest dealer.

BEST TRACTORS

## GREAT HONORS WON

(Continued from Page 285)

Steer under one year—1, Briggs on Donald Lad 1. 2, Bunting on Mission Don. 3, Gable on Foxy. 4, Glide on Surprise.

Carload—1, Kern Co. Land Co.

Grand champion steer—Bunting on Mission Jim.

### DAIRY CATTLE

**Jerseys**

An even 200 animals, the largest number ever at a California fair, was the contribution of the Jersey breeders to this year's state show. The quality was not in keeping with the quantity, and sometimes the judge was at a loss to find enough animals to fill his awards. It was a wonderful turn out of the breed and is to be commended. A little more feed when the animals are young, a little better fitting and training of the candidates and more attention to showing would have worked wonders in the contest. Judge Brandt is from Oregon where Jerseys are plentiful and where the breeders fit and show like veterans, and he was somewhat disappointed in the way some of the California men show. He was much pleased with many of the animals and spoke highly of them.

The classes were all large and from 12 to 27 were the rule. The tent provided for the judging was much too small and the judge was often forced to make his preliminary pick of the class and send the balance to the barn in order to have sufficient space in which to work.

Size and great individuality, combined with promised production, were the points most closely watched. The aged cow class of 23 was topped by Salome of Mossdale who was later made senior and grand champion. This 12 year old cow has had championship honors numerous times but never looked better than this time. She calved at the Stockton fair and was shown in full bloom. Harry Cook of Chino, showing at the state fair for the first time, was highly successful, and his sweet senior heifer calf was junior champion.

There was considerable rivalry between Thorp's Jolly Senator Raleigh, who has many times been champion, and Financial Corrector, the two year old owned by the Waterloo Jersey Farm for senior championship. The young bull is a hard one to beat and vanquished his aged contender. He was also made grand champion over Guy Miller's senior bull calf, the junior champion.

The awards were well distributed showing that no breeder has a corner on the best animals in the state and everyone was well satisfied.

Exhibitors: Ferdinand R. Bain, Los Angeles; C. E. Barrows, Orland; Mrs. C. E. Barrows, Orland; Barrows & Rider, Orland; California Polytechnic School, San Luis Obispo; Daniel F. Conant, Jr., Modesto; Marguerite A. Conant, Modesto; Harry H. Cook, Chino; W. D. & C. O. Day, San Luis Obispo; M. Fortini, Orland; W. G. Gurnett, Orland; W. J. Hackett, Ceres; Charley F. Krause, Orland; N. H. Locke Co., Lockeford; Guy H. Miller, Modesto; N. S. Nelson, Orland; John A. Norton, Sacramento; Harry L. Perkins, Orland; Judge Peter J. Shields, Sacramento; J. Rudolph Tanner, Morro; J. E. Thorp, Lockeford; Waterloo Jersey Farm, Lockeford; J. E. Wherrell, Riverside.

The awards follow:

Aged bull—1, Thorp on Jolly Senator Raleigh. 2, Nelson on Dairy Maid's Gay Prince. 3, Barrows & Rider on Samuel's Noble Foxhunter. 4, Hackett on Romulus Interest. 5, Thorp on Biddy King of Mossdale.

Two year old—1, Waterloo Jersey Farm on Financial Corrector. 2. Thorp on Fairy Boy of Mossdale.

Senior yearling bull—1, California Polytechnic School on St. Mawes Flying Owl. 2, Bain on Gamboge's Majesty's Falcon. 3, Thorp on Biddy's King of Mossdale Jr. 4, Wherrell on Snowdrop's Oxford Prince.

Junior yearling bull—1, Gurnett on Foxy Prince of Orland. 2, Cook on Fern Bettie's Champion. 3, Hackett on Leonard Farm Graces Majesty. 4, California Polytechnic School on Poppy's Lady Glow Boy. 5, Locke on Financial Topsy Is King.

Senior bull calf—1, Miller on Marigold Altama Owl. 2, Locke on Combination's Judge of L. 3, Locke on Rhyme's Judge of L. 4, Wherrell on Eminent Polly's You'll Do. 5, Shields on Riga's Lord Karnak.

Junior bull calf—1, Miller on King's Perfection Owl. 2, Fortini on The Nobleman of Tintagel. 3, Gurnett on Foxy Gordon of Orland. 4, California Polytechnic School on Unnamed. 5, Marguerite Conant on Betty's Laddie Boy.

Aged cow—1, Thorp on Salome of Mossdale. 2,Thorp on Goldies Nehalem Cowslip. 3, Waterloo on Valets Grace Dereed of L. 4, Bain on Wizz's Tessa May. 5, Cook on Shylock's Maid.

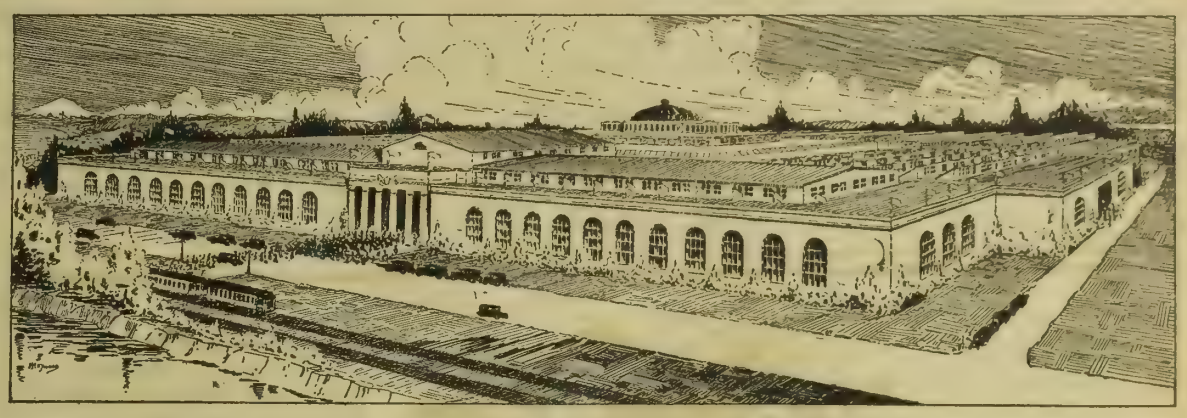
Three year old—1, Bain on Violet of Mossdale. 2, Gurnett on Foxy Lass of Orland. 3, Harry H. Cook on Imperial

# See the Champions

## of All Breeds at the

# Pacific International Live Stock Exposition

## November 4-11, 1922



The above reproduction shows the buildings of the Pacific International Live Stock Exposition, located at North Portland, Oregon. This building covers ten acres of ground under one roof and is the largest live stock building in America (perhaps the world) and houses more than 3,500 pure bred live stock in addition to more than 2,500 chickens and rabbits. Practically all breeds of dairy cattle, beef breeds, swine, sheep, goats and horses are exhibited annually, also Dairy Products, and Manufacturers' and Land Products Shows.

### Our 1921 Show

The 1921 Pacific International Exposition was reported to have been the best live stock show of all breeds in America. This not only means the best show of any one individual breed, but for all breeds. It was truly an exposition for "champions" which were shown. In addition to the 3,500 animals on exhibit and 2,500 rabbits and chickens, the Night Horse Show was an added attraction, which was equal to any in the country. The attendance in 1921 was 101,400. Many of the big breeders came out from the East to see this show. We recall one instance where two special Pullman cars were chartered to bring a group of Holstein breeders to the exposition. Everybody was most enthused over the possibilities of the Pacific International Show.

### Brief History of Pacific International

Not so many years ago a group of live stock breeders gathered at Portland, Oregon, and brought the winners of the various state fairs together for exhibition purposes in a tent. There were only a comparatively few animals that year entered for premiums, but they saw the possibilities of holding a big live stock show after all the other fairs and dairy shows had been completed. At that time they organized what is known now as the Pacific International Live Stock Exposition Company, a non-profit organization. Between $300,000 and $400,000 was subscribed by breeders, farmers and business interests of Oregon, Washington, Idaho, California, Montana and British Columbia for original plant of five acres. In order to put up additional buildings the Oregon State Legislature granted them $100,000 and in addition they then went among their friends and sold bonds. Today they have approximately $750,000 invested in buildings, and the Exposition Company is operated in much the same manner as a regular mercantile business—operated solely for the upbuilding of the live stock industry, not only on the Pacific Coast, but throughout America.

The following men, officers and directors of the Pacific International Live Stock Exposition Company give their time in directing the affairs of the Exposition and have invested considerable money and serve to the best of their ability without compensation.

E. A. Stuart, President, Seattle, Washington.

Chas. H. Carey, Vice-President, Portland, Oregon.

Wm. Pollman, Vice-President, Baker, Oregon.

Frank Brown, Vice-President, Carlton, Oregon.

Frank Robertson, Treasurer, Portland, Oregon.

The Directors are:

W. B. Ayer, Portland, Oregon. Shorthorns and Hampshire Sheep.

O. V. Battles, Yakima, Wash. Aberdeen-Angus.

Frank Brown, Carlton, Oregon. Show Ring Judge—Shorthorns.

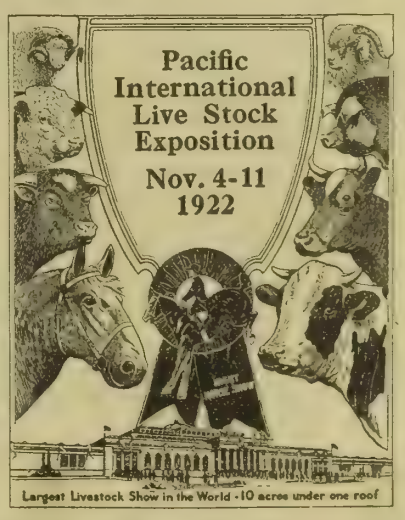
Chas. H. Carey, Portland, Oregon. Horses.

A. D. Dunn, Wapato, Wash. Shorthorns.

Ray J. Fox, Lyons, Oregon. Poland China Hogs.

C. L. Hawley, McCoy, Oregon. Lincoln Sheep and Guernseys.

Wm. M. Ladd, Portland, Oregon. Jerseys.



Roderick Macleay, Wedderburn, Oregon. Cattle and Goats.

Walter A. Moore, Hollywood, Wash. Holsteins and Poultry.

Thos. T. Miller, Hollister, Cal. Shorthorns.

Wm. Pollman, Baker, Oregon. Range Cattle and Horses.

Frank Robertson, Portland, Oregon, Shorthorns.

F. M. Rothrock, Spokane, Wash. Shorthorns.

A. C. Ruby, Portland, Oregon. Horses.

H. E. Sellwood, Portland, Oregon. Poultry.

E. A. Stuart, Seattle, Wash. Holsteins.

Henry Triessen, Sweetwater, Ida. Herefords.

Oswald West, Portland, Oregon. Night Horse Show.

### Our 1922 Show

The prospects for the 1922 Show look even brighter than the 1921 Show. There will be approximately $75,000 given out as premiums, including the Night Horse Show.

Our liberal advertising appropriation will assure a larger number in attendance this year than last.

### An Educational Vacation

Judging from the enthusiasm shown by visiting breeders last year, many of them are planning on taking their annual vacation and coming to the Pacific Coast at the time the Show is on, namely November 4th to 11th.

If you are not planning on bringing a Show string to the Pacific International, plan on visiting the Show and bring your family and tell your neighbors to do the same. Special certificate may be had by writing O. M. Plummer, entitling members of breeds and allied associations to one and one-half railroad fare for round trip.

### Premium List Ready

Breeders thinking of exhibiting at the Pacific International are requested to write for premium list which has just been received from the printers. This gives full information as to the closing dates, classification, etc.

**ADVANCE INFORMATION**

**Any Further Information Regarding the Pacific International can be had by Writing**

**O. M. PLUMMER, General Manager and Secretary, 211 Northwestern Bank Building, Portland, Oregon**

Bertha. 4, Cook on Shylock's Marquisa Interest. 5, California Polytechnic School on Miss Sargent's Queen.

Two year old under three—1, Waterloo on Goldie's Dame Onota. 2, Thorp on Girlie of Mossdale. 3, Marguerite Conant on Fox's Sunshine Betty. 4, Hackett on Oxford's Zalema Gold. 5, Krause on Pearl of Willowood 3rd.

Senior yearling heifer—1, Bain on Gamboge Majesty Red Feath. 2, Hackett on Eliza's Oxford Girl. 3, Waterloo on D. L's Aljibe. 4, Wherrell on Fawn Lass Dottie Bell. 5, Thorp on Wardress of Mossdale.

Junior yearling heifer—1, Cook on Fern's Interested Violet. 2, Thorp on Kings Miss of Mossdale. 3, Hackett on Kings Zalema Rosa. 4, Miller on Signet of Venadera. 5, Peterson on Pilots Induction of Waikiki.

Senior heifer calf—1, Cook on San Aloi's Rexie. 2, Waterloo on Financial Corrector's Fozola. 3, Wherrell on Gold Links Mabel. 4, Waterloo on Financial Corrector's Viola. 5, Hackett on Bess Baen Belle.

Junior heifer calf—1, Locke on D. L. K.'s sunshine of L. 2, Hackett on L. F. Lady's Flapper. 3, Bain on No. 258, Unnamed. 4, Waterloo on No. 267, Unnamed. 5, Cook on San Aloi's Lady's Supreme.

Senior and grand champion bull—Waterloo Jersey Farm on Financial Corrector.

Junior champion bull—Miller on Marigold Altama Owl.

Senior and grand champion cow—Thorp on Salome of Mossdale.

Junior champion cow—Cook on San Aloi's Rexie.

Aged herd—1, Waterloo. 2, Thorp. 3, Cook.

Young herd—1, Cook. 2, Miller. 3, Wherrell.

Calf herd—1, Wherrell. 2, Thorp. 3, California Polytechnic School.

Get of sire—1, Locke on get of Imp. King's Valet. 2, Miller on get of Jap's Perfection Owl. 3, Waterloo on get of Financial Corrector. 4, Cook on get of Sans Alois Brightness.

Produce of dam—1, Gurnett on produce of King's Lass of S. B. 2, Cook on produce of Shylock's Financial Lady. 3, Thorp on produce of Salome of Mossdale. 4, Wherrell on produce of Fern Oxford's Snowdrop.

Five cows in milk—1, Cook. 2, Thorp. 3, Locke.

### Holsteins

The black and white cows were not so numerous as in some former years, but the quality was superb. Of the 106 head shown, nearly three-fourths were from Southern California, where the best in Holsteins are being assembled. Fred Hartsook with 37, Berylwood with 27, and George Junior Republic with 18 made up the bulk of the show. The Millbrae herd from the peninsula south of San Francisco was the principal contender from the northern part of the state.

Among the 18 aged cows led out there were more high record cows than were ever shown in one ring anywhere in the world. The entire show was an example of the doctrine that great individuality and high production do go together. The grand champion cow, Ava Model Hengeveld 2d, has a yearly record of 1129 pounds butter and the grand champion bull, Prince Aaggie of Berylwood, is the highest record bull for an average of his seven nearest dams, in service in the world.

The second prize aged cow was later first in the county cow testing association show where conformation and production are combined to score and all breeds compete. In this class Fred Hartsook's cows ranked 1-2-3-4.

The third prize aged cow, Fay Tritomia Hengerveld Walker, owned by Berylwood Stock Farm, is the state champion four year old for 305 days.

The class for five cows in milk was a sensation and for the first time in history one man won first and second. Hartsook showed ten wonderful cows, most of them high record, but his entries were closely pushed by the Berylwood and Junior Republic entries, which were 3 and 4, respectively.

Hartsook's get of Tritomia Pietertje Ormsby, sired by last year's champion bull of the National Dairy Show, was head and shoulders above all others in that class. This get won last year in a number of shows for the Maxwell Farms.

The produce of Snowflake Juliana Fobes of Rock won for the Junior Republic over the Hartsook entry of produce of K. S. P. Lily McKinley. This was a wonderful class and Berylwood was close behind with the produce of Miss Bracelet Fobes Korndyke and of Fay Tritomia Hengerveld Walker.

In the aged bulls the Hartsook entry won over the Millbrae bull, who was grand champion many years ago, and Dichter Spofford Korndyke Lad 5 owned by the Junior Republic, who championed last year's show, but he was unable to defeat the great young Berylwood bull for the grand championship honors.

Junior championship in the females went to the Junior Republic on Fobes Dichter Juliana, a wonderfully sweet senior yearling heifer.

The grand champion cow was also first in the advanced register class where record and conformation both count.

Exhibitors: Earl Ahmaun, Bakersfield; Samuel Baecke, Galt; Berylwood Stock Farm, Hueneme; Ralph Bisnett, Turlock; Frank Breseiani, Petaluma; California Junior Republic, Chino; California Polytechnic School, San Luis Obispo; Varian Costa, Galt; V. F. Dolcini, Davis; Fred Hartsook, Lankershim; J. A. McCormack, Oxnard; Millbrae Dairy, Millbrae; F. Pfeiler, Oxnard; R. C. Rasmussen, Petaluma; Baird Snodgrass, Hueneme; Ellis Snow, Bakersfield; Marjorie Walters, Santa Paula; Harold A. Wood, Modesto.

The awards follow:

Aged bull—1, Hartsook on Major Korndyke Pontiac Fobes. 2, Millbrae on King Pontiac Musa Netherland. 3, Junior Republic on Dichter Spofford Korndyke Lad 5th.

Two years old and under three—1, Breseiani on Sir Ormsby Korndyke Fern. 2, Rasmussen on Sir Highland Skylark. 3, Dolcini on Sir June Acres Aaggie Mead.

Senior yearling bull—1, Berylwood on Prince Aaggie of Berylwood. 2, Junior Republic on Republic Spofford Ida Lyons.

Junior yearling bull—1, Hartsook on Tritomia Pansie Ormsby. 2, Berylwood on Prince Alcartra Walker Segis.

Senior bull calf—1, Hartsook on Meadhart Aaggie Mead Ophelia. 2, Hartsook on King Artis Segis Pontiac. 3, Millbrae on Millbrae Therese Korndyke. 4, Junior Republic on Republic Dichter Julian. 5, Berylwood on Count Alcartra Veeman.

Junior bull calf—1, Millbrae on Millbrae Pontiac Olive Korndyke. 2, Hartsook on Meadhart Aaggie Mead 7th. 3, Berlywood on Prince Fobes Korndyke. 4, Hartsook on Meadhart Aaggie Mead. 5, Hartsook on Meadhart Aaggie Mead 6th.

Aged cow—1, Hartsook on Ava Model Hengerveld 2nd. 2, Hartsook on Lady Cornucopia Mercedes. 3, Berylwood on Fay Tritoma Hengerveld Walker. 4, Hartsook on Bessie Snowball DeKol.

Three years and under four—1, Hartsook on Jessie Fobes Snowball. 2, Hartsook on Sarcastic Dulcina Jewell. 3, Junior Republic on Lady Dichter Juliana. 4, Berylwood on Arcula Alcartra Mead. 5, Junior Republic on Coliana Snowflake Korndyke.

Two years and under three—1, Millbrae on Millbrae Pontiac Sarcastic Maid. 2, Hartsook on Lily McKinley Ormsby. 3, Berylwood on Holland Pietertje Fobes. 4, Hartsook on Wadnah Ormsby Skylark. 5, Junior Republic on Handsome Tuebie Spofford.

Senior yearling heifer—1, Junior Republic on Fobes Dichter Juliana. 2, Hartsook on Ragapple Tritomia Ormsby Segis. 3, Berylwood on DeKol Sunshine Creamelle. 4, Hartsook on Cornucopia Paul Segis Fayne. 5, Berylwood on DeKol Creamelle Sunshine.

Junior yearling heifer—1, Hartsook on Caroline Wayne Fayne. 2, Berylwood on Lassie Mercedes of Ions Home. 3, Baird Snodgrass on Pearl Aaggie Hengerveld Segis. 4, Hartsook on Lilly Tritomia Pietertje Ormsby. 5, Hartsook on Flush Ormsby Tritomia.

Senior heifer calf—Hartsook on Meadhart Mary. 2, Millbrae on Millbrae Antoinette Pontiac. 3, Junior Republic on Queen Dichter Pontiac. 4, Hartsook on Nancy Calmo Korn 2nd. 5, Berylwood on Lady Anonis Segis.

Junior heifer calf—1, Hartsook on Meadhart Jocaba Pontiac. 2, Millbrae on Millbrae Babronia Pontiac. 3, Berylwood on Piebe of Berylwood. 4, Hartsook on Meadhart Eva Boba. 5, Millbrae on Millbrae Pontiac Francine 2nd.

Cow having official yearly record—Hartsook on Ava Model Hengerveld 2nd.

Senior champion bull—Hartsook on Major Korndyke Pontiac Fobes.

Junior and grand champion bull—Berylwood on Prince Aaggie of Berylwood.

Senior and grand champion cow—Hartsook on Ava Model Hengerveld 2nd.

Junior champion cow—Junior Republic on Fobes Ditcher Juliana.

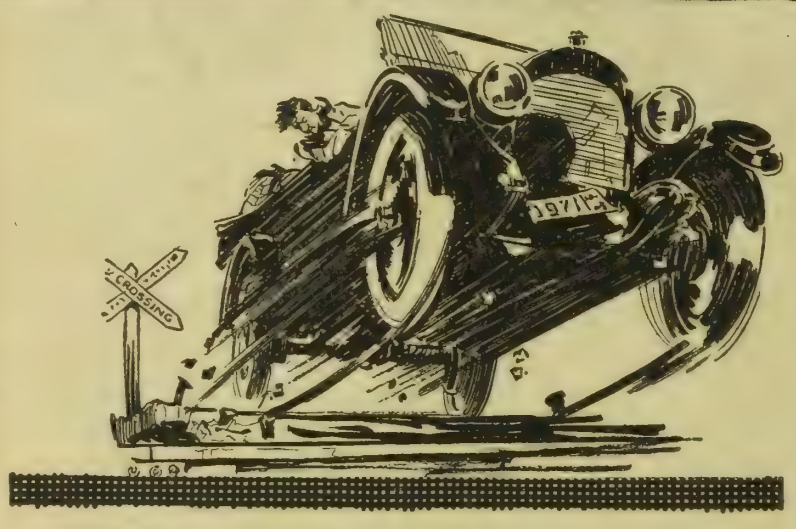
Aged herd—1, Hartsook. 2, Millbrae 3, Junior Republic.

Breeders young herd—1, Hartsook. 2, Junior Republic.

Calf herd—1, Millbrae. 2, Hartsook.

Get of sire—1, Hartsook get of Tritomia Pietertje Ormsby. 2, Millbrae get of King Pontiac Musa Netherland. 3, Hartsook get of Sir Aaggie DeKol Mead. 4, Ventura County Calf Club get of Pearl King Segis Pontiac.

Produce of dam—1, Junior Republic produce of Snowflake Julian Fobes of Rock. 2,, Hartsook produce of KSP Lily McKinley. 3, Berylwood produce of Miss Bracelet Fobes Korndyke. 4, Berylwood produce of Fay Tritomia Hengerveld Wal-



# The Designer Expected This!

No one knows better than the car designer how destructive are the forces of *shock, vibration, heat, cold, moisture, dust, oil, sudden starts* and *jarring, crashing stops.* No one realizes more keenly the superlative importance of correct design as well as quality in all parts of a motor car.

So, when 200 builders of cars and trucks choose Willard Threaded Rubber Batteries as standard, original equipment, it means an overwhelming endorsement of Willard design as well as Willard quality.

*Ever since you began driving a car* you've been piling up in your mind evidence of Willard quality, Willard stamina, Willard ability to keep you out of battery trouble! You *know* that a Willard, with Threaded Rubber Insulation, will cost you less "in the long run"—and mighty little, if any more, at the start!

Now the point is: Have you nailed down your determination with spikes of steel? Do you *know* that, when the time comes, you're going to buy a Willard Battery on your own judgment—and not be led aside by somebody who isn't going to have to *live* with the battery as *you* will? In other words, CAN YOU MAKE YOUR DECISION STICK? *That's* the question.

WILLARD STORAGE BATTERY COMPANY, CLEVELAND, OHIO
*Made in Canada by the* Willard Storage Battery Co. of Canada, Limited, Toronto, Ontario

**200 Makers of Cars and Trucks Use Willard Threaded Rubber Batteries as Standard Original Equipment**

ker.

Five cows in milk—1, Hartsook. 2, Hartsook. 3, Berylwood. 4, Junior Republic.

**Guernseys**

The Guernsey show at the state fair seldom equals in numbers the shows of the southern part of the state. This year only two herds plus a single individual appeared but the quality was a decided improvement over many previous years. The Italian Vineyard Company of Guasti, showing for the first time, bumped up against by far the best herd A. B. Humphrey of Escalon has ever shown, and gave him real competition. Four of the blues and junior champion cow went to the Southern California herd.

Humphrey's get of sire by Nobleman of Maple Hill was about the finest one that has been shown in years. This bull who was again grand champion has proven to be a great sire.

The senior and grand champion female, Mayhew's Bonnie Lass, is one of the grandest two year olds ever shown anywhere. She had a strenuous time defeating the Italian Vineyard Company's entry, a daughter of the great cow, Caroline of Chilmark, in her class but after this award was made there was no question as to which animal would be grand champion. A little better heart girth was the only advantage she had over the Caroline heifer.

The Italian Vineyard Company has been in Guernseys only a year and was shut out of some classes on that account but it proved that it had many animals of the highest type and quality.

Every animal but the aged bull shown by Humphrey was bred by him and the herd can certainly be an object lesson to men who are or want to become breeders. The advancement has been apparent through the past few years and the owner can certainly feel a great pride in what he has accomplished.

Exhibitors: Italian Vineyard, Guasti; Arnold Cattani, Bakersfield; A. B. Humphrey, Escalon.

The awards follow:

Aged bull—1, Humphrey on Nobleman of Maple Hill. 2, Italian Vineyard on Cherubs Sunny Jim of Revada.

Two year old and under three—1, Italian Vineyard on Carl E. King of Hollow Hill Farm.

Senior yearling bull—1, Humphrey on Escalon Princess White Face. 2, Humphrey on Escalon Favorite.

Senior bull calf—1, Humphrey on Escalon Riccardo. 2, Humphrey on Escalon Golden Noble. 3, Italian Vineyard on Twilight Topper. 4, Italian Vineyard on Ruben L. King of Hollow Hill Farm.

Junior bull calf—1, Humphrey on Escalon Senator.

Aged cow—1, Humphrey on Phillys of Mayhews. 2, Italian Vineyards on Imp. Fan of Bickleigh. 3, Italian Vineyards on Revada's Princess Pat.

Three year and under four—1, Italian Vineyards on Rosie E. King. 2, Cattani on Glenrose Hope. 3, Humphrey on Escalon Daisy.

Two year and under three—1, Humphrey on Mayhews Bennia Lass. 2, Italian Vineyards on Caroline E. Langdon of Hollow Hill Farm. 3, Italian Vineyards on Jewel Langdon of Hollow Hill Farm. 4, Italian Vineyards on Lillia of Navarino.

Cow, senior yearling heifer—1, Italian Vineyards on Karmaletia of Calimono. 2, Humphrey on Escalon Nancy. 3, Humphrey on Escalon Pearl. 4, Italian Vineyards on Azucena Langdon of Hollow Hill Farm.

Junior yearling heifer—1, Humphrey on Escalon Joan. 2, Humphrey on Escalon Naomi. 3, Italian Vineyards on Cherubs Daisy of Castleview.

Senior heifer calf—1, Italian Vineyards on Guasti's Violet. 2, Humphrey on Escalon Pollyanna. 3, Humphrey on Escalon Lottie.

Junior heifer calf—1, Humphrey on Escalon Valentine. 2, Humphrey on Escalon Beauty.

Senior champion bull two years old or over—1, Humphrey on Nobleman of Maple Hill.

Junior champion bull under two years—1, Humphrey on Escalon Riccardo.

Senior champion cow two years old or over—1, Humphrey on Mayhew's Bonnie Lass.

Junior champion cow or heifer under two years—1, Italian Vineyards on Guasti's Violet.

Grand champion bull—1, Humphrey on Nobleman of Maple Hill.

Grand champion cow or heifer—1, Humphrey on Mayhew's Bonnie Lass.

Graded herd—1, Humphrey. 2, Italian Vineyard.

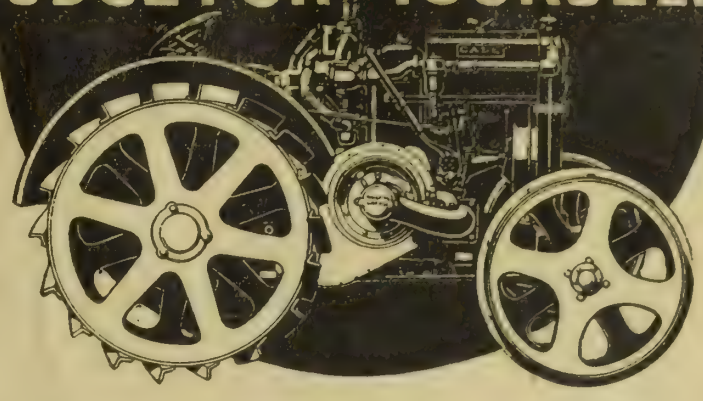
Breeders young herd—1, Humphrey.

Calf herd—1, Humphrey on Escalon Lottie.

Get of sire—1, Humphrey get of Nobleman of Maple Hill. 2, Humphrey get of Nobleman of Maple Hill. 3, Italian Vineyards get of King of Hollow Hill Farm. 4, Italian Vineyards get of Effie's King of Hollow Hill Farm.

Produce of dam—1, Humphrey produce of Grape Wild Jewel. 2, Italian Vineyards produce of Caroline of Chilmark. 3, Humphrey produce of Imp. Daisy H of

**JUDGE FOR YOURSELF**



THE qualities that insure you a profit from the use of a tractor are: General usefulness, economy and durability. Case Farm Tractors meet all these requirements fully. Judge for yourself.

**Usefulness:** A size for every farm, each size equally well adapted to field or belt work. Ample clearance. Safe to operate on side hills. Practical traction speeds. Power in reserve to meet emergencies. Easy to turn, to steer and to handle in small fields, orchards and around buildings.

**Economy:** Four cylinder, vertical, heavy duty engine operates on low grade fuel. A fuel system so efficient that Case tractors have won first place in practically every important test in which they have been entered. Full power of engine delivered at belt, and an unusually large percentage at the drawbar because of the Case spur gear transmission.

**Durability:** Rigid frame holds all gears, shafts and bearings in permanent alignment, preventing unnecessary wear and strains. All bearings, gears and working parts fully enclosed, protected from dust and dirt, and positively lubricated. All working parts easily accessible and replaceable in case of accident or for adjustment. Removable cylinder barrels. Patented Case air washer. Gears of special steel. High grade roller and ball bearings.

Our new booklet, "Better Farming with Better Tractors," tells in fullest detail why and how Case tractors are profitable machines for farmers to use. Write for it.

# Do You Want Duty-Free POTASH?

If so, write at once to the Representative from your Congressional District, and also to both of the United States Senators from your State, and urge them to ask the members of the Conference Committee, which is now considering the Tariff Bill, to agree to the Senate amendment which leaves Potash on the Free List, where it always has been.

Briefly, what has happened is this:—

The Tariff Bill passed by the House imposed a duty of $50 per ton on fertilizer Potash. The Senate restored fertilizer Potash to the Free list, and voted down a proposal to pay a bounty of $50 per ton on Potash produced in the United States. The question now before the Conference Committee is simply whether fertilizer Potash shall remain on the Free List or shall pay a duty of $50 per ton. This duty would double the price of Potash to the farmer.

The House of Representatives did not vote on fertilizer Potash as a separate item, although many members wished to do so. There will now be a chance for such a vote, when the Conference Committee makes its report.

**The proposed duty would make farmers pay over sixty million dollars ($60,000,000.00) more for the same amount of Potash that they have been using in the past.**

The promoters of the speculative Potash enterprises in this country maintain a very active organization in Washington, and will spare no effort to induce Congress to impose this enormous burden on the farmers of the country.

The Washington representatives of the Farm Organizations oppose this duty and will welcome your help.

Write to your Congressman and Senators today, and let them know how *you* feel about it.

## HOCHHEIMER & CO.
WILLOWS, CALIF.

ORDER AT ONCE — Write for Descriptive Literature — THEY WON'T LAST LONG

Your appreciation of the California Cultivator can be shown best by writing to and buying from Cultivator advertisers.

the Courtil Honchin. 4, Italian Vineyards produce of Twilight of Glenfield Springs.

**Ayrshires**

The Ayrshire show was made up of but two herds, one from the Le Baron Estate at Valley Ford, and the other from the H. G. Ranch in Santa Barbara County.

These herds had met at Stockton the week before, much to the advantage of the H. G. herd. Judge John L. Smith at the state fair saw them differently and the Le Baron herd won most of the blues and all of the championships.

A grand two year old bull, Middlesex Royal Champion, was made grand champion without much opposition from his junior champion herd mate, Narabel Constable.

Grand championship on the aged cow, Princess Maggie was placed without her presence as she decided to calve just at the time she should have been taken into the ring. However, she was an outstanding individual and was awarded the palm anyway. Narabel Cherry, the senior yearling heifer was junior.

## POWER ON THE FARM

(Continued from Page 291)

to make them wear resisting and as nearly permanent as possible.

The Schmeiser Manufacturing Company displayed their track wheel attachment for small tractors. The track is 12 feet long and 10 inches wide, giving a ground bearing surface of 300 square inches. The drive sprocket is 40 inches in diameter, made of chrome steel and bolted to the hub. If desired a complete fender covering the entire length of the tracks may be had.

Some of the Good Things scheduled for this week's Cultivator but necessarily held over are a portion of accounts and awards at the state fair. Wood's account of the Central California Citrus Institute at Lindsay, Braunton's account of Walnut Institute at Santa Barbara and other interesting material.

One of the most attractive showings was made by the H V. Carter Company which embraced the large Allis-Chalmers tractor and the small garden Beeman. So many uses are to be found for a small tractor that one could profitably be placed on every farm in California. They are needed in the truck garden and the home garden, the orchard, the field and every place where a single horse drawn implement is used. They require so little fuel that their cost of operation is almost a negligible factor.

In the Allis-Chalmers tractor we find an 18-30 tractor that has many features to recommend it to the careful buyer. The power plant consists of a four cylinder vertical, valve-in-head type engine designed for kerosene. The motor is equipped with a Kingston double bowl carburetor fed by gravity. Power is transmitted through an expanding clutch which is simple and easy of adjustment. The drive wheels are fifty inches in diameter with a twelve inch face.

Aside from the tractors the power on the farm tent contained exhibits of power sprayers, plows, harrows, seeders, rakes, sub-soilers, mowers, and in fact, almost every conceivable implement that is ordinarily used in conjunction with a tractor.

The exhibit of the John Deere Plow Company contained many new and valuable improvements. The new Hoover potato digger with its adjustable rear rack agitation not only cleans the potatoes but throws the vines to one side. A new grape and vine hoe may be so adjusted as to place the dirt toward the vines or away from them according to the needs.

The Deere Model W reversible disk harrow may be used as a ridger by a slight movement of one of the levers. The small eight walking plow has a swivel beam which permits close work near vines and trees.

Knapp Ploy Company of San Jose featured their light draft subsoil plow which is used in conjunction with a tractor. This is a very fine single standard plow for both power lift and auxiliary hand screw lift for adjusting depths and for use when the plow is not in motion. The axle is above the beam which prevents clogging under the beam. The frame is a very rigid construction, as is necessary for heavy sub-soil work. The land shoe is extra heavy and is strongly riveted to the standard, making it possible to shear off the rivets.

This sub-soil implement should find popular favor.

Greater crowds gathered around the exhibits than at any previous fairs, indicating that a keener interest is being taken in power as applied to successful agriculture.

# Poultry Queries

(Conducted by Jean A. Koethen)

### Depluming Mite

I enclose samples of tail feathers eaten off by something. What is the remedy?—Subscriber, Santa Cruz.

The feathers are being eaten off by the depluming mite, a parasite which lives among the masses of epidermal scales near the stumps of the eaten-off feathers. Any one of the following ointments may be rubbed on to kill these pests: Oil of caraway, 1 part oil to 5 parts vaseline; Balsam of Peru; zinc ointment and vaseline, equal parts; a sulphur ointment made by mixing flowers of sulphur, 1 dram, carbonate of potash, 20 grains and lard or vaseline, 1 ounce.

### Probably Cholera

I have lost three chicken hens and a turkey hen with diarrhoea. They sit around and combs turn black. Have saved one by giving Epsom salts. They have free range, milk, kale and grain.—A Satisfied Reader.

This looks like cholera, which is more often than not due to unsanitary conditions. A thorough clean-up is the best cure. Dr. Salmon recommends treating the sick birds with 2 to 4 teaspoons of carbolic solution twice a day. The solution, which is ½ per cent, is made by 1 part of the 5 per cent solution to 9 parts water. They should also have sour milk. If the birds do not quickly respond to treatment, kill all that are sick, and give the well ones 2 doses daily of the carbolic acid solution for two or three days. Houses and yards should be thoroughly cleaned and disinfected.

### Feeding Pullets

Why do so many of my pullets go to roost with a partly filled crop. The condition is generally accompanied by a withered looking comb and width of only one finger between pelvic bones. Can the Hogan test be successfully applied to these seven months old pullets? If so, would you cull them at once? In the evening I feed 40 per cent soaked barley, 60 per cent grain. They scorn the grain and wait for the barley. Would you approve of feeding soaked grain at night and hard grain in the morning.—Subscriber, Ontario.

Your pullets are not getting the proper ration, and it looks as if they were molting as well, a thing which is to be expected in February pullets, though not usually so early as August. It is absolutely essential that every pullet go to roost with a full crop, and to this end some poultrymen give a moist mash the last thing before the pullets go to roost, following the regular meal of scratch grain at 4 o'clock. Suppose you try this ration: Sprouted barley in the morning; green feed about the middle of the forenoon; dry commercial mash before them all day; all the hard grain they will eat and a little more at 4 o'clock. Moist mash just as they start to roost. Make the grain feed a mixture of wheat, barley and cracked corn, with the corn about 50 per cent. Give a little more than they will clean up so that there may be some left for morning. There is nothing to be gained in soaking grain. Use either whole or rolled barley, and be sure that the corn is sweet and yellow. Do not try to cull till you have tried this full ration. Early pullets often molt in the fall in spite of the best of care, and are worth keeping for all that. If there are any that have not begun to lay by the time they are eight months old—have not laid at all, I mean—you can safely let them go.

## EGG LAYING CONTEST—AUGUST REPORT

Santa Cruz: The third California Farm Bureau Egg Laying Contest is now entering the last month lap and preparations are under way for the opening of the fourth contest, October 1.

Alex Stewart, Santa Cruz, 2476 2/3; Hanson's Poultry Farm, Corvallis, 2342 2/3; J. J. Shore, Santa Cruz, 2200; L. A. Thornewill, Santa Cruz, 2135; D. B. Walls, Petaluma, 2078; C. H. Russell, Santa Cruz, 2073; Sunrise Poultry Farm, Santa Cruz, 2051 1/3; W. J. Neef, Santa Cruz, 2047; Hollywood Farm, Hollywood, Washington, 2041 1/3; Corbett, Santa Cruz, 2037.

## SONOMA EGG LAYING CONTEST

Report, November 1, 1921 to August 15, 1922. All entries are White Leghorns.

### Highest Hens

H. R. Thomas, 238; G. E. Mahoney, 221; Thomas, 214; C. H. Purvine, 214; Des Praetzel, 209; F. J. Kohnke, 207; E. O. Hussey, 203; Brown Bros., 201; Peck's Poultry Farm, 199; J. W. Kock, 199; W. B. Hussey, 198; Thomas, 196; D. E. Cox, 196; J. J. King, 194; T. B. Purvine, 193; J. F. Kohnke, 192; A. M. LaFranchi, 188; J. J. King, 187; Garich & Sarich, 187; Hussey, 187; D. Ingwerson, 187; A. M. LaFranchi, 187.

## STORRS EGG LAYING CONTEST

Storrs, Connecticut, August 29, 1922—Report for week ending August 28, 1922:

With now nine weeks to go there is a very respectable chance for the Leghorns to finally defeat the Wyandottes that have been leading the contest at Storrs for the past several months. A year ago at this time Hollywood Farm's Leghorns from Holywood, Washington, were 83 eggs behind the leaders, but finished the year with only 16 eggs less than the winners. In the present contest Hollywood's birds are now only 39 eggs back of first place and gaining steadily. Either the Wyandottes or the Leghorns look equally good bets.

The four leading pens in each of the principal breeds are as follows:

### Plymouth Rocks

Harry G. Culver (Barred), 1823; W. H. B. Kent (Barred), 1777; Ontario Agricultural College (Barred), 1663; Purdue University (Barred), 1645.

### White Wyandottes

Frank P. Matteson, 1877; Woodbridge Orchards, 1820; Walter Bradbury, 1728; Clemens J. Diemand, 1581.

### Rhode Island Reds

The Orchards, 1660; John Z. Labelle, 1629; Charles D. Peirce, 1607; F. S. Chapin, 1525.

### White Leghorns

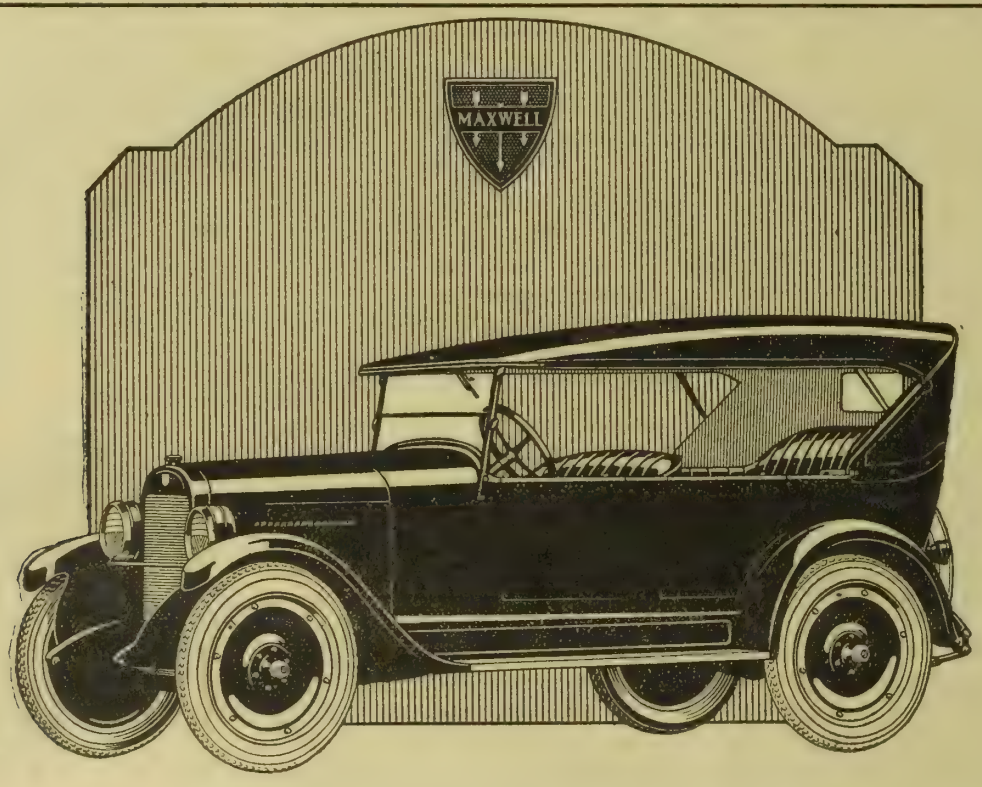
Hollywood Farm, 1838; Goshen Poultry Club, 1707; J. Frank Dubois, 1700; Rapps Leghorn Farm, 1679.

## MARKET PROSPECTS ON LIMAS

MANAGER R. L. Churchill, of California Lima Bean Growers Association, has just returned from a 30 days trip during which he visited the principal cities of the South, East and Middle West. Mr. Churchill brings a message of hope and cheer to California Lima and Baby Lima bean growers.

General business conditions are decidedly promising. Merchants, bankers and financial experts are almost unanimously looking for a brisk trade and free movement of all staple commodities this fall. Basic manufacturing industries are becoming active, and for the first time in two years many retail merchants are booking orders for tneir future requirements.

Stocks of all varieties of beans, both at points of production and at distributing markets, are almost entirely cleaned up. This is very different from the situation the past two or three years when the beginning of new crop harvest found large quantities of old crop holdover remaining on hand unabsorbed. One year ago the largest markets of the country, which are on the Atlantic seaboard, were so heavily stocked with old crop Limas that but few of the new crop were purchased by them until after the first of the year. Now, these big markets are bare and anxiously waiting for new crop supplies. The foregoing applies to both domestic and foreign imported beans, excepting a few thousand bags of Roumanian beans, recently imported because of real scarcity



A kind of value not to be duplicated, in the kind of a car the farm needs. Long mileage on gas and oil and tires. Genuine comfort on the road. Ease of handling, even in rough going. Beauty that makes people turn to watch it go by.

Cord tires, non-skid front and rear; disc steel wheels, demountable at rim and at hub; drum type lamps; Alemite lubrication; motor-driven electric horn; unusually long springs; deep, wide, roomy seats; real leather upholstery in open cars, broadcloth in closed cars; open car side-curtains open with doors; clutch and brake action, steering and gear shifting, remarkably easy; new type water-tight windshield. Touring Car, $885; Roadster, $885; Sedan, $1335; Coupe, $1235. Prices F. O. B. Detroit, revenue tax to be added

MAXWELL MOTOR CORPORATION, DETROIT, MICHIGAN
MAXWELL MOTOR CO., OF CANADA, LTD., WINDSOR, ONT.

*The Good*
MAXWELL

of and extremely high price of small white beans in this country, but these cost importers mostly between $5.50 and $5.85 delivered duty paid, New York, and will not compete with new crop Michigan pea bean or California Large and Small Whites which are being quoted and sold at somewhat lower than the above prices.

An unusually large quantity of new crop Limas and Baby Limas have already been sold as "futures" for September and October shipment, (undoubtedly more than 250,000 bags), which it is expected will prove more than one-fifth of the entire production. It seems reasonable to assume that at least an equal additional amount will be purchased by the jobbers during this same period, and it would keep all the warehouses very busy to clean and ship 500,000 bags in September and October. Aside from the association, the bulk of the sales made to date have necessarily been "shorts" and the volume of buying from growers that will be required to fill these sales should, commencing with the latter part of September and extending throughout October, be sufficient to create good local demand at fair prices, even though the supply is considerably larger than last year. Most of the sales already made as "futures" have been on basis of $6.50 to $6.75 for September shipment and from $6.00 to $6.50 for month of October shipment. Lower quotations are being made by certain shippers, presumably with the idea of getting the margin between the buying price (from growers) and the shipping price (to jobbers) as large and as profitable as possible.

The shipping prices just named will permit a retail price to the housewives of around 10 cents to 11 cents per pound, according to location of market and type of store which is as low as usually prevails when f. o. b. California shipping price is 5 cents, and growers price considerably less. A retail price of from 10 cents to 11 cents per pound, would be 33 1-3 per cent reduction from the 15 cents to 16 cents per pound, retail price which has been generally current in recent months, and Limas and Baby Limas move into consumption very freely, according to past observation and experience, at around 10 cents per pound to the consumer.

Michigan pea beans (Small Whites) and Colorado Pintos have been selling (old crop) at very high prices this spring and summer, but fortunately for all concerned prices on new crop have been declining very rapidly recently. The opinion of the largest and best posted dealers in those states seems to be that their beans will mostly move at from $5.25 to $5.50 for September shipment and around $5.00 for October and November shipment. As California Limas ordinarily obtain at least $1.50 per cwt, higher price f. o. b. cars, this again indicates that shipping price of $6.25 on California Limas would continue to be reasonable and in line, even if Michigan and Colorado prices should get down to $4.75.

The United States government's official forecast (as of August 1) for 1922 bean crop, in the principal bean producing states, which are California, Michigan, New York, Colorado, New Mexico, Idaho and Arizona, shows an estimated total production of 12,800,000 bushels as compared with a total of 9,100,000 bushels total in 1921, or a prospective increase of about about 33 1-3 per cent. This is not a large increase to absorb when we commence with a bare market; particularly when this same government report states that the average consumption for the past four years has been 12,630,772 bushels annually. It will be noted that when cleaning loss and seed requirements are deducted from this year's estimated production, the remainder is considerably less than the average annual consumption.

From all these facts and conditions, it would appear that growers of Limas and Baby Limas, should obtain more than 6 cents for September shipment and not far from 6 cents for October-November shipment. They can thereby stabilize the market upon a fair and proper basis. Such a condition will be so much more sensible and satisfactory than a declining and chaotic market which would cause grief and loss to growers, shippers and distributors, with no probable resulting market benefit to consumers.

## Haul the Modern Way—with International Motor Trucks

THOUSANDS of farmers in America have invested in motor trucks because they have found that the use of horses for hauling is an extravagant waste. Time is too valuable to spend behind slow-plodding horses, and the owners of farm trucks have taken the surest way to increase their productive time. They have advanced a long way toward farming efficiency.

On the basis of the established reputation of International Motor Trucks for dependable, low-cost service in city and country hauling, we urge you to consider the present line of Internationals. Sizes range from 2000-lb. Speed Truck to the 10,000-lb. truck for heavy duty work. Bodies can be furnished for hauling fruit, milk, stock, grain, feeds, vegetables, etc. Figure out the cost of your present hauling system. It is likely you can save many dollars with International equipment.

Peaches: Market steady. Locals and Northern, freestone and cling, all varieties, 3@4 lb.

Pears: Demand good, market steady. Northern: Bartletts, mostly 4@5; locals, 4@4½.

Plums: Demand and movement slow, market steady. Per lb.: Locals 2@4; Northerns: Various varieties 3@4 lb.

Watermelons: Local Klondike, best, 85@1.00; poorer, low as 50.

### GRAIN

California Farm Bureau Marketing Exchange reports:

Barley: Indications are that not over 20 per cent of the total California barley crop has been marketed so far this season. Usually, a considerable quantity in excess of this amount has changed hands. Very little exporting has been done so far. Southern California, however, has cleaned up fully 50 per cent of the barley crop, including the Imperial Valley, and will have to draw from distant points and will, consequently, have a generally higher range of values than San Francisco during this season. Present values are around $1.22½ to $1.25 for No. 1 feed and as high as $1.27½ for good clean barley, f. o. b. Los Angeles.

Wheat: Wheat values have somewhat stiffened owing to the fact that California farmers are letting lose very slowly and are not selling any faster than the demand will take it. This is likely to result in California farmers taking some lower prices for later shipments owing to the lower prevailing Eastern prices which, when their movement of wheat becomes free will bring wheat into California terminals at less than present California values. Present markets are about $1.85 for No. 1 hard white wheat and $1.80 to $1.82½ for soft white and Sonora, subject to federal grades and discounts.

# Citrus Markets

Los Angeles, September 13, 1922.

Valencias are closing the season with exceptionally satisfactory prices. Auctions are taking everything offered in prices ranging from 4.70 to 10.00. Other markets are ranging from 8.00 to 9.00. Shipments are running between 300 and 400 cars per week.

Exceptionally warm weather has created a demand for every lemon which could be secured. F. o. b. quotations are running around 7.00 to 7.50 on better grades. There will perhaps be between 60 and 70 cars shipped within the next three weeks.

### Citrus Shipments

Shipments of citrus fruits to date since November 1, 1921. Southern California: Oranges, 21,906 cars; lemons, 9,193; total, 31,099. To same date last season: Oranges 36,966; lemons, 10,482; total, 47,448. From Central California to date this season: Oranges, 5,099; lemons, 106; total, 5,205. To same date last season: Oranges, 6,603 cars; lemons, 185; total, 6,788. From Northern California to date this season: Oranges, 372; lemons, 8; total, 380. To same date last season: Oranges, 305; lemons, 5; total, 310.

# Snappy Notes on Livestock

Any error herein is unintentional and subject to correction the following week. This summary is assembled from the best sources obtainable, and both producers and packers can assist by reporting actual sales or buys, giving names, dates and facts, and we will, if requested, withhold names. All we want is fact and a fair deal and correct information for the producers. Address A. L. Spellmeyer, care California Cultivator, 317 Central Avenue, Los Angeles. The Cultivator reaches over 40,000 producing farmers and livestock men.

The report that Los Angeles packers had contracted 1000 Northern Arizona grass fat steers for deliveries starting October 15 at $6.50 per cwt., f. o. b. Northern Arizona has been confirmed.

This price is equivalent to $7.50 for light grass beef delivered Los Angeles,

and has been denied locally, with the statement that the price of $6.50 was paid weighed Los Angeles. To make certain I have the matter confirmed by an officer of the Arizona cattle association of that county, naming in writing the firm buying, the party selling, the number of steers, price and weighing point together with the amount of forfeit advanced. Inyo County men, Utah and Nevada men who have grass steers to sell can well take notice of this price, which is for this grade of cattle the highest price paid for over a year in this market.

A bunch of guaranteed fat Mexican steers 900 pounds offered at 6 cents Los Angeles, was turned down by four local packers. A bunch of 200 guaranteed fat cows was not accepted by several packers at $4.50 range.

Several small lots of fat steers were reported for sale in Inyo County at $5.50 but they will be snapped.

A president of a county cattle group writes me his best personal regards, stating range is fine, and he sold his yearlings at 5 cents Arizona, and a sprinkling of twos and threes which he states will be fat, and is glad the buyer is going to make money. He adds he is certain cattle are now on the up, and a further comment "To H—— with the Los Angeles market, for I sell mine at home."

The pot is boiling on this stockyards question. Relative to the uneven quotations, such as paying $7.50 for light Northern Arizona steers, when delivery expense is figured and offering 5 to 6 f. o. b. Inyo County or 7 cents scant on a delivered basis for better cattle, another man asks, "Will not stockyards cure this very difference and insure better average prices to all producers?" This bulletin attempts to represent, as is, without bias. With or without yards Los Angeles killing needs are 1200 cattle daily. The hot weather slackened up beef a half cent as people eat ham sandwiches instead of rib roasts.

Several Arizona ranchers are figuring to sell their fat cows this fall and replace with equally good thin stock from Texas or New Mexico, as Arizona has an exceptional year.

Carcass prices are stronger and hides are better. There is some purchasing of feeders but California is tailing the other states and will have to finish up in Utah, Nevada and the North to get the right kind it wants. The prices there are going to be higher than 5 cents which California feeder buyers have hesitated to pay f. o. b. range in Arizona. Unless more cattle than I can see show up a 6 cent feeder price is looming and that means 7 cent delivered feeders and 9 cent beef, and that again means if Middle West markets permit.

Northern Arizona is about cleaned up as to steers, and Southern Arizona, from Tucson to the New Mexico line, offers but a comparatively few thousand twos and threes steers left. Drouthy districts of New Mexico and Texas do offer a supply. Utah and Nevada have a strong hand and are waiting and keeping it well covered. The lowest priced feeders and cheapest beef in the West for quality, are in California, especially in the Southern higher mountain, fall delivery districts, and that don't supply over 10,000 with most of them needing yearlings they are not yet buying. A bunch of 2500 good boned Arizona steers lagged all week at $35 and they were long twos and extra good cattle. Specific lots of low priced Arizona, New Mexico and Texas cattle were offered to California buyers last week, and while they stood in their tracks, Colorado and other buying states grabbed all they could borrow or beg money to buy. The open offers of $6.50 delivered Los Angeles for lots of fat grass 1000 pound and up steers, is a joke in view of the $6.50 Arizona beef price paid on an October 15 contract.—A. L. Spellmeyer.

## POWER ON THE FARM

Those who visited the Power on the Farm tent at the state fair could not help but be impressed with the evidence of the rapid growth of the deep tillage idea and the progress that has been made in the construction and improvement of implements.

Competent men explained the operation of the various implements shown and advised farmers of their advantages in solving some of the hard problems of farming.

A number of new types of implements were shown and at new prices.

A few years ago the idea of tillage of the sub-soil was comparatively new, but a gratifying advancement was evidenced this year by the number of farmers who told stories which testify to the advantages of deep tillage in producing increased crops of better quality for them.

A farmer has said, "If I can farm the farm under my farm I double my crops." In a sense this is true. If we want the earth's treasures we must dig them out. The "digging" may be comparatively easy with the right tool. Attendants at fairs this year are seeing these tools.

More power on the farm means more "power" financially.

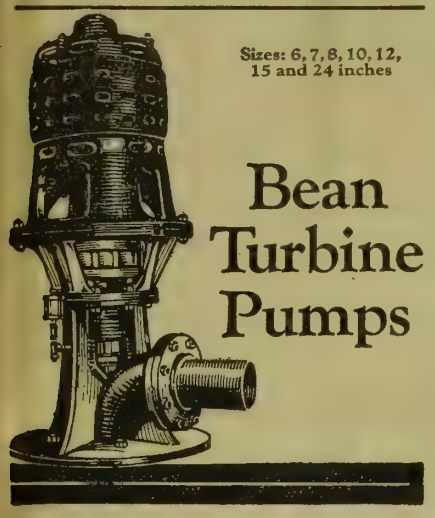
## GREATER EFFICIENCY

In the big Power on the Farm tent at the state fair one of the most interesting exhibits was that of the H. C. Shaw Company of Stockton.

California made implements, designed to meet the needs of farmers in this state, were the dominating feature. Several new tools recently perfected by the Brenneis Manufacturing Company of Oxnard, were prominently displayed. Chief among these was the new single standard vineyard subsoiler and the four gang extention disk harrow. In designing the vineyard subsoiler the manufacturer has given particular attention to the strength of materials and the positive lift will raise the 18 inch blade. The implement is narrow and compact and should prove very effective in deep cultivation.

The Brenneis extended orchard disk harrow is only 20 inches high with all working parts in direct line with the axels and pull. The frame will carry 500 pounds of extra weight. It is equipped with 18 inch cutout disks controlled by a positive automatic shift which sets the disks at any angle. There are no levers or cranks and the disks are covered with shields to protect low growing branches of trees. The harrow is so built that it will work close up to the trees while the tractor operates in the center between rows and side draft has been eliminated.

The Shaw Company also displayed a complete line of orchard cultivators equipped with positive automatic power lift.



Sizes: 6, 7, 8, 10, 12, 15 and 24 inches

Bean Turbine Pumps

These pumps assure maximum delivery of water at highest efficiencies, against varying heads. They are made in very small sizes to fit your domestic well and deliver from 100 to 180 gallons per minute. Made also to deliver up to 3500 gallons per minute.

Careful, high grade engineering skill and workmanship is employed throughout.

SUPER-TEST
Asbestos - Fibre Liquid Cement
SAVES OLD ROOFS
MAKES THEM GOOD AS NEW

SUPER-TEST CEMENT

is backed by factory service guaranteed for ten years.

IT WILL RENEW YOUR OLD ROOF AND SAVE THE COST OF A NEW ONE

It fills and seals all holes, cracks and crevices

WEATHERPROOF — WATERPROOF — FIRE RETARDING — SUNPROOF — RUSTPROOF PRESERVATIVE PROTECTIVE.

Easy to Apply. Economical. It Defies the Deteriorating Elements.

Especially adapted to Pacific Coast Climatic Conditions

WILL NOT RUN, CRACK OR PEEL

Made in California

How much Rain do your Shingles absorb?

Shingles that become easily rain-soaked are poor roof protection. Damp, unhealthful farm houses and buildings are the result. And besides, the rain-soaked shingles warp and crack when the sun comes out.

Shingle roofs, to give you the excellent protective service of which they are capable, should receive preservative treatment. ORONITE SHINGLE OIL not only helps keep out moisture, but penetrates the wood fibre sufficiently to retard evaporation of natural oils — a source of life and strength to shingles. A tight, well-laid roof will give full protection when treated with ORONITE SHINGLE OIL.

If you want to mix it with colors, our nearest agent will supply you with formulas. ORONITE SHINGLE OIL is easily applied to roofs or side shingled walls.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If among the more than 40,000 Cultivator's weekly circulation any fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

## EDITORIALETTES

It is asserted that the fig crop of California is one which is not produced in excess of the demand. Like the almond, if it can be given a reasonable degree of protection from some of the cheapest labor in the world, the California grown fig has a fighting chance. This has induced quite general planting during the past few years. The more common varieties planted are those which make the finest dried product. Figs in the form of jams and preserves are more in demand than formerly and we doubt not this will open the way for still greater increase in the industry. The illustrations on the cover and Mr. Condit's article will afford a fund of information for those interested in this phase of the industry.

* * *

In this connection we are reminded that on practically every diner East of the Rockies, on a trip covering nearly 8,000 miles, there were served "figs in syrup." This was a delicious conserve of exactly four little figs served in a very rich syrup in small glass jar. In every case the label indicated the figs were packed in Texas. The four figs including a small jar of cream were served at 35 cents. Several times we called for California figs and once we received the information that "fresh California figs" would be served but that there were none served in syrup. Texas has the advantage of cheaper lands, nearness to market, and possibly other advantages, still we cannot refrain from asking, "Why not California figs in syrup?"

* * *

Washington reports world production of wheat this year, excluding Russia and Mexico, is estimated by the United States department of agriculture at 3,019,526,000 bushels, based on actual estimates from reporting countries and estimates based on condition reports. Production in 1921 was 3,059,596,000 bushels, and for the prewar 1909-13 average 2,890,353,000 bushels. United States, Canada, Japan and British India show great increase while all of Europe shows serious decrease. Russia will not export but it is thought she will be able to feed herself.

* * *

The cotton crop is reported as greatly damaged from drouth, boll weevil, rust and army worms. The production will be much less than the earlier estimates in all of the Southeast. Bumper crop west of the Rio Grande.

* * *

The other day a man in Los Angeles celebrated the hundredth anniversary of his birth. The most pleasing part of the event was the fact that it was not only a celebration because a human being had simply existed for 100 years, but more because of the strength of forceful character and continued activities. The centenarian is Cornelius Cole, born September 17, 1822, and still engaged in the practice of law. Mr. Cole represented California in the United States senate when Abraham Lincoln was president. He was a pioneer, a '49er, a thoroughgoing believer in and a lover of California. The Cultivator has heartiest wishes for the continuation of Senator Cole's useful life. May there be many—very many happy returns of the day.

## FIRES

Fire is sweeping the mountain sides all up and down the state. Every one was started because some human was careless—or worse.

BE CAREFUL WITH FIRE!

## HOT WEATHER

Los Angeles, Riverside, San Bernardino and Orange Counties took their hot weather in a condensed dose last Sunday. Walnuts were burned slightly, perhaps a ten per cent reduction of the crop.

Temperatures ranged from 95 to 110 degrees.

## SAFETY FIRST

For three weeks the world had its eyes fixed on a little community up in the foothills of the Sierra Nevada and prayed that the lives of the 47 entombed miners might be spared. The miners were not spared. Our praying and the action which should go with devout prayers began all too late. For 22 days almost super-human effort was made by the former companions of the entombed miners. Their lives had been smothered out by the deadly gases within a few hours after the fires began. They had endeavored to barricade and keep out the poisonous gas. Now we are asking, "Who is to blame?" Investigators of state and nation will endeavor to answer for us. So far it appears that mine owner, inspectors representing the state of California and others had taken precautions which it was thought were sufficient to prevent any disaster. Yet 47 brave fellows have lost their lives. The discouraging feature of it is that it is simply another case which reminds us of similar occurrences, excepting usually of lesser magnitude. In the one city of Los Angeles alone the deaths caused by traffic accidents during the past twelve months have averaged nearly one every day. "One or two daily" may be hardly sufficient to cause the world to stand horrified and demand that the awful waste of human life be stopped. But when this waste aggregates three or four hundred people within a year, or when a disaster like that at Jackson shocks us into consideration of the awfulness of it, we all begin to ask,

"Who is to blame?"

Quite often the victim. More often not. But in a sense are we not all to blame? Are we not putting too low an estimate on the value of a life? We erect cross arms at every grade crossing on which is painted the command "Stop, Look, Listen." None of us think of stopping, and very few even look or listen. Many are the cases where two or three or possibly a dozen lives have been ended because of lack of one minute's thoughtfulness. We look back only about a twelve month and recall the death of a whole buss load of school children in the northern end of the Sacramento Valley and say, "That was due to the thoughtlessness of a school boy driver." But again we must express the belief that it was as much due to the mental attitude of ninety-nine hundredths of the rest of us humans as much as it was to the one boy.

Let us all have a thought while there is opportunity that it may be of service. Provide beforehand for way of escape from the deadly fire gas and encourage more thoughtful attitude when approaching railway crossings or other places where modern methods endanger human life.

## FORESTRY IN OHIO

Some time ago we were amongst the farmers of Ohio. We asked all kinds of questions. They answered and at times suggested "Why don't you go over to the Wooster Experiment Station? It's only 25 or 30 miles." We went to Wooster. So here are some observations as to forestry practices on the station grounds.

### Forestry

Of greatest interest to me was the forestry work of the station.

In Ohio the department of forestry was established by an act of the legislature in 1906 and given charge of the forest interests of the state. Its duties as prescribed by law are "to inquire thoroughly into the character and extent of the forests of Ohio; to investigate the causes of their waste and decay; to conduct investigations in the several sections of the state in order to determine the species of valuable trees best suited to grow on the various kinds of soil of the state; to ascertain the cost and best methods of propagating, planting, cultivating and managing woodlots and plantations on the various kinds of soil; to determine by investigation the average annual rate of growth of the various species of trees and the relative values of the various kinds of timber for commercial and domestic purposes; to conduct experiments in the treatment of the various kinds of wood for the purpose of increasing durability; to determine by experiment and investigation the kinds of trees and shrubs best suited to the various situations for windbreads and shelter, for beautifying grounds, and the best methods of planting and managing the same; and to determine the needs for the preservation, improvement and development of the forests of the several sections of the state."

The experiment station early recognized the importance of definite knowledge as to the culture and growth of forest trees and had already planted on the grounds, in addition to ornamental groves and windbreaks, experimental plots of catalpa, ash, osage orange, locust, pine, larch, spruce and the various native timber trees.

Part of the rugged woodland on the eastern side of the farm has been cleared and converted into forest nurseries with an annual capacity of 150,000 trees. In addition to supplying the state forests stock is furnished to state, municipal and private institutions, county experiment farms and private landowners for cooperative planting. This affords an opportunity to study the behavior of various species under the different soil types and climatic conditions.

A part of this new ground has been divided into quarter acre plots for separate and mixed plantings of all the best native and foreign species, to test the possibilities of reforesting wholly waste areas. This aboretum now contains more than 50,000 trees of approximately 75 different species.

The mature and weed trees only have been removed from the rest of the woodland, leaving the native growth of young ash, oak and walnut, which growth has been supplemented by planting the best species of evergreen and deciduous forest trees, to determine the practicability of improving woodlots by thinning, replanting and protection. Here, too, is a test of many species under different conditions.

The department immediately after its organization began a survey of the forest conditions of the state to determine the extent and character of its woodlots. This survey has led to cooperation with landowners in applying known forestry methods for the improvement and perpetuation of wooded areas, and it has furnished data upon which a definite forest policy is being formulated.

The department is directing the planting and management of woodland areas of many state, municipal and private institutions and of farmers. The people of Ohio under the leadership of their foresters are face to face with the big problem of improving and maintaining more than 3,500,000 acres of native woodlots and the reforestation of thousands of acres of waste land. A part of the work of the station is to school the people to a realization of the possibilities and vital importance of the forestry work. Every properly planted and protected woodlot, whether the park of a city, the campus of a college or a part of a farm, becomes an example of the possibility of turning similar areas into revenue producing forest tracts which will rival in time the virgin forests felled by the pioneers.

The state and its citizens individually realize the importance of their forests; they see the need for an ample future timber supply, the need for protection to water courses, the wastefulness of idle land and eroding hillsides, and the possibilities of the forest areas as ultimate sources of income.

In 1915 the assembly, recognizing the need of the state's taking the lead in this work, appropriated $10,000 for the purchase of cheap land for state forests. Two tracts, one of 221 acres (the Waterloo forest) in Athens County and another of 1,500 acres (the Dean forest) in Lawrence County, were bought. These have been surhave been made and their development has begun. These forests and the cooperative forests in all parts of the state furnish much needed practical information as to species, natural and artificial reforestation, care of the woodlot and the marketing of its products.

The bulletins published are valuable, the more impressive lessons however are those of the field.

# The Brunswick Fig

By Ira J. Condit, Horticulturist
California Peach and Fig Growers

Illustrations of the Brunswick and Brown Turkey figs may be seen on the cover. The upper group in the illustration shows the Brunswick. Regarding this fig Mr. Condit writes: "The Brunswick fig shown here is identical with the Magnolia fig of Texas. It is a good preserving variety but it does not equal the Kadota in this respect."

"The Brown Turkey figs shown in the lower illustration are very common around Los Angeles at this time of the year."

UNTIL the introduction of the White Adriatic fig, the Brunswick, according to Dr. Eisen, was the most common light or brown fig in California. The trees are small straggling and hardy with deep cut, narrow lobed leaves, especially on the suckers. First crop figs are very large, dingy green or brown, watery, poor in quality, but early and one of the first to appear in the market. The second crop figs are much smaller, more abundant, spherical or somewhat elongated, brown in color, with a hollow center and pink flesh. On account of the uniform medium size, the Brunswick figs have been commonly marketed for preserving. The Vernon Coon's orchard at Elk Grove is the only commercial planting, so far as I know, in the state. Individual trees, however, are common in orchards and gardens.

The Brunswick fig is identical with the Magnolia, the famous preserving fig of Texas. Van Velzer in his book on the fig states that one of the pet names of the Brunswick is the Magnolia. He further states that "those who still contend that the Magnolia is a new variety, distinct from the Brunswick, can discover their error by studying the leaves, bark, wood and fruit, which characteristics and habits distinguish it from all others."

J. L. Nickel writes: "I will add that the Magnolia fig, which I received from two different nurserymen in Texas, also proved to be identical with the Brunswick as received from London and Niles." In reply, therefore, to the common question, "Has the Magnolia fig of Texas been tried out in California?" we can say that the same variety, the Brunswick, has been grown here for at least 70 years, and the results are not encouraging from a commercial standpoint. For preserving purposes, I believe, the Kadota fig is far superior to the Brunswick, as the fruit is lighter in color, more attractive in appearance, both fresh and in glass, and both crops are more abundant.

### Caprification

Caprification changes the character of the Brunswick fruit as reported by Tribble Brothers of Elk Grove in 1912. "The color of the skin was changed from a light brown to a dark purple with nearly black ribs. The size was much enlarged, the quality not much improved, and some of the figs soured on the tree. The dried figs had the nutty flavor, as did the Mission. It was noted that the one or two very light brown uncaprified figs contrasted strongly in the cluster of dark purple figs."

On account of its short, stubby habit of growth and early maturity, the Brunswick tree is hardy and well adapted to the colder sections of California where ordinary fig varieties do not thrive. For most counties in the state, there are several varieties of figs which are more satisfactory both for home orchards and for commercial crops, than the Brunswick.

W. T. Kirkman, Sr. of Pasadena writes as follows regarding the Brunswick: "The Brunswick fig is not uncommon in these parts and is always highly commended by those who know it as the sweetest and more nearly seedless of all figs. One of our cannery men wishes me to locate all of these I can for him. I will say, however, that this fig has its shortcomings here. It seems the more you pet it the worse it behaves. Some of the best cared for trees cast off most all their fruit when half grown, while those without care of any kind ripen a fair crop of smaller figs. I think ordinary field cultivation without irrigation would bring it to its best performance."

### Good Shipping Variety

The nomenclature of the Brown Turkey and the Brunswick figs is considerably confused by growers, nurserymen, and the commission men throughout the state. It is hoped that the illustrations on the cover will help growers to differentiate these varieties more positively. While the true name of a variety does not make much difference to some growers, it does make a vast difference when one variety is ordered for commercial planting and the grower discovers after three or four years that he has an inferior variety to the one he ordered.

### The Brown Turkey

The true Brown Turkey fig is best known in California in the vicinity of Los Angeles, where there are some commercial orchards (notably that of John Schelnik, Montebello) and numerous individual trees. The large dark brown figs are very common on the Los Angeles markets in September and October, and one of the commission men has developed a considerable business in shipping the figs in pony refrigerators to New York and other Eastern cities. I, myself, saw these fresh figs selling as high as $3 per dozen in New York in November, 1919.

The Brown Turkey tree is a much more thrifty grower than the Brunswick, the leaves are larger and not so deep or narrow lobed, and the figs of the main crop are larger and darker in color. The fruit is large and heavy and usually hangs to one side, so that the mature fig is very oblique in shape.

E. R. Thurber, of Vacaville, has a few large trees, probably the Brown Turkey, which mature their first crop shortly after that of the Mission trees. The fresh fruit, therefore, brings attractive prices on account of the scarcity of other figs at that time. The figs of the second crop are inferior for drying as compared to the Mission; they sour more readily and are more subject to the attacks of birds on account of their season. For the production of fresh figs in the southern coast districts the Brown Turkey seems to be an excellent variety. For the interior valleys it should not be planted except in collection of varieties.

# Subsoiling and Deep Irrigation

In a recent issue of the California Cultivator was an answer to a question asked by a Visalia subscriber as to deep irrigation of lands which are "of a cement nature and adobe together with a red sediment mixture. In other words, I want to put my irrigation down in the soil, not on top as previously, and I have peaches, oranges and some vines. I was under the impression that I might use a subsoiler every time I did a job of irrigation, especially the way the land would irrigate, not crosswise, and the crosswise subsoiling would be done every fall. Could I run a subsoiler, single standard, through this space every three to four weeks, and follow in the path with the water, and still not add too much water to the soil or to the trees or vines? Would this deep irrgation and tillage be harmful by cutting feeder roots?"

Mr. Neff answered the question on page 130 of the August 5 issue in effect that a single standard subsoil plow should be used, not necessarily at each irrigation. One subsoil furrow in the center of each tree space and across the furrows carrying the water will be better than to run the water in the subsoil furrow. The single standard subsoiler can be run in both directions once, in the center of each tree space, but in beginning it will be better to go in one direction only the first year. Some of the feeder roots will be cut in any event, but if the subsoiling is practiced the roots of each tree or vine will be confined to its particular square and have the use of as much soil as it would have with longer roots and other trees encroaching on the space around that particular tree, with advantage of more water and better distribution of water. The furrows carrying the water should be made as deep as can be conveniently done.

R. P. Lehr of the Killefer Manufacturing Company and who has made wide observation of soil culture in California with fullest investigation as to needs of orchardist in the matter of tillage implements finds that Mr. Neff's recommendations do not tally with those which Mr. Lehr thinks should be given.

We regret that Mr. Neff is not now in California but he will return from trip to Illinois within a few weeks and, we hope, he will more fully enter into the discussion.

Mr. Lehr writes:

"I am sure that it was the writer's intent to give the inquirer good advice, but in the light of the long experience of the founders of this company, you have instructed him in a way that may reduce his crop eventually and cost him money in the end.

"The best practice in late years has repeatedly demonstrated that far better results are obtained by running water in subsoil furrows, or so-called 'subsoil ditches.' Subsoiling across the flow of water, or 'following the contour lines' is only best in hilly country when water is run down the terraces. Water run in the bottom of a subsoil furrow has many obvious advantages. It leaves the surface mulch dry and no surface moisture is lost to the elements as compared with small trickling surface streams.

"It is a sad but true fact that most 'irrigation pan' has been caused by just such practice as you have recommended; running the water in small streams not more than three feet apart. This practice has been a fine thing for our business, but not for the grower. It has been the cause of our selling a great proportion of our heavy cultivators to break up irrigation pan and hard pan.

"The surface soil, containing its bacteria and humus, is the laboratory for the preparation of plant foods. It is assisted by the sun's warmth and other agencies such as oxygen, nitrogen, carbonic gases, etc., including moisture, and you would be surprised to know what benefits are being obtained by deep subsurface irrigation and deep cultivation over the old method of shallow irrigation and after cultivation to a depth of four to six inches, such as you recommend in the article in question."

Mr. Wood comments:

We quite agree with Mr. Lehr with reference to deep cultivation provided same is practiced from the time the orchard is first started but in the case at point in our issue of August 5 we believe Mr. Neff offers the best solution to the problem, since our subscriber states that his trees are from four to nine years of age and to follow Mr. Lehr's plan of very deep subsoiling after the roots have been allowed to establish themselves near the surface, would, we fear, give the trees a shock.

Grapes and peaches have a tendency to root fairly deep but oranges will send out their feeder roots just under the surface of the ground if allowed to do so and in Florida and some other sections where summer rains make it unnecessary to practice irrigation it is claimed that better results are obtained by very shallow cultivation, in fact some do no cultivation whatever. It is not policy, however, to handle citrus orchards here in this manner but we believe that better results will be obtained by cultivating to a depth of six to eight inches rather than deeper as citrus trees depend more or less on the warmth of the surface soils, especially in the early spring.

# Agricultural News Notes of the Pacific Coast

## Northern California

Contra County has recently shipped 75 cars of grapes and 80 cars of tomatoes.

Alturas, Modoc County, has a new pencil factory, the wood used being native juniper.

Bartlett pears from Placerville, El Dorado County, brought $4.70 a box in New York City.

The Clarksburg district of Yolo County is harvesting more than 5,000 acres of beans.

Grass Valley, Nevada County, reports a heavy crop of pears and plums, but the prices are too light.

Conservative estimates place the shipments of fruits from Placer County this season at 5,000 carloads.

The largest grape crop deal to date is the sale of 65 acres of Zinfandels at Lodi, for $400 an acre, on the vines.

The Coffman orchard at Lodi has an exhibit of peaches which average an individual circumference of 12 inches.

Eureka, Humboldt County, reports a heavy crop of vetch seed, which will not all be harvested before September 20.

Durham, Butte County, shipped 100,000 bags of wheat during the first week in September; also 15 carloads of grain hay.

The big tent for the Glenn County fair at Orland is claimed to be the largest ever made or used on the Pacific Coast.

More than 100 carloads of wheat and barley have been sold this year through the Butte County farm bureau exchange.

Word comes from Marysville that from 500 acres of Bartlett pears, five orchardists have sold more than $300,000 worth of fruit.

The four year old long pruned peach orchard of A. J. Macfarlane at Oroville, Butte County, yielded six tons an acre of Tuscan clings.

The manager of the Glenn-Colusa irrigation district reports water was shut off from 3,000 acres on September 1 and the rice is being harvested.

The residents of Sisson, Siskiyou County, are very indignant because the postmaster general wants to change the name to Mount Shasta.

England is cabling to California for raisins because the European raisin market is demoralized through the Turks beating the Greeks in war.

Traffic Manager Faye, of the Western Pacific, announces a reduction of 40 cents per hundred pounds on eggs shipped to points east of Chicago, effective October 16.

Representatives of the units of the Federation of American Farmers from San Joaquin, Butte, Colusa and Glenn Counties will meet soon to arrange for a state meeting of the federation.

A Live Oak, Sutter County, rancher has a "sport" seedless grape that is as large as a Muscat, and of a flavor different from Thompson seedless, which the vine was supposed to be.

Judge J. H. Logan, of Hayward, who "discovered" the original loganberry growing in his garden, has received an invitation from the governor of Oregon to be a special guest at the state fair on "Logan Day," September 29.

## Central California

The Tulare high school is to institute an agricultural course.

The cooperative cannery at Modesto expects to continue work till October 1.

In 17 days one packing plant at Kingsburg, Fresno County, shipped 57 cars of fruit.

Near Delano, Fresno County, 250 tons of Elberta peaches were picked from 24 acres.

The Oakdale Almond Exchange featured an almond exhibit at Oakdale's district fair, September 12.

Sweet potato growers of Merced and Stanislaus Counties met, September 7, and fixed price at $1.70 per hundred pounds.

The Tulare County prune harvest is now in full swing, with a very heavy crop, the June drop this year proving very light.

The grain harvest in the Tulare basin is over and more than 1,225,000 sacks have been harvested from the lake district.

An experienced lettuce grower from the Imperial Valley has settled near Clavicle, Fresno County, and will grow lettuce there.

Several packing houses in Fresno and adjoining counties opened about September 15 to pack late Malagas and Emperors.

Fruit box factories in the San Joaquin Valley are running 12 hours a day to help overcome the shook shortage in some sections.

Pork producers are going to celebrate a "hog day" at Kearney Park, Fresno, October 20, and $1,000 in prizes will be awarded.

Word has been received at Fresno that owing to the Turko-Grecian war, Smyrna figs are not picked, some destroyed, and the demand for California figs will be strong.

Fresno chamber of commerce received a cable from Turkey: "Raisins sent as gift to starving children unloaded. Greatly needed."

One section of land in the Tulare basin, 608 acres, produced 31.23 sacks of wheat to the acre. Another section yielded 31.12 sacks.

Many Merced vineyardists stopped picking grapes because of low prices in the East, to resume only when advancing prices will justify expenditures.

Turlock grape shippers report slight shortage of cars, also of box shook. Thompsons are bringing around $25 a ton; Malagas and Zinfandels, $50 to $65; Alicante Bouschet, around $100.

The accumulation of California grapes in eastern markets on Saturday, Sunday and Labor Day brought a big slump in prices but Fresno reports that car shortage alone will bring prices back.

At the end of a seven year "scrap" the Miller and Lux estate and the Madera irrigation district have come to an agreement and 80,000 acres of land in Madera County will be irrigated and put on the market.

Agreement has been reached by the Madera irrigation district, West Side storage district and Miller and Lux interests, after years of litigation, which will permit formation of the San Joaquin River water storage district.

## Southern California

Three inches of rain fell at Niland, Imperial County, September 2.

During August 52 carloads of fruits and vegetables were shipped from Imperial County.

Victor Valley, San Bernardino County, will ship 120 carloads of fat cattle this season.

The Orange County bean harvest started September 8 and the crop is estimated at 500,000 bags.

The grape crop of the Fontana district in San Bernardino County, is estimated at 4,000 carloads.

Cotton seed in the Imperial Valley is bringing $20 a ton, an advance of six dollars over the 1921 price.

Imperial County is prosecuting all land owners who allow Johnson grass to mature seeds on their property.

Rialto, San Bernardino County, shipped 12 cars of grapes the first week in September, the first of the season.

Residents of West Covina are up in arms against the establishment of a sewer farm in their midst by the city of Covina.

Livestock market news service has been started at Los Angeles by combined federal and state departments of agriculture.

The Deciduous Fruit Distributors, San Bernardino, offers $50 for the best name for fancy apples shipped from that district.

The Rotarian Club of Orange County is contemplating the purchase of the famous Modjeska ranch for a club retreat.

The Santa Barbara walnut growers have fixed picker's remuneration at $22.50 a ton, ranch weight, and $27.50 per ton warehouse rate.

The Monte Vista Citrus Association at Riverside is erecting a modern citrus fruit packing house. Cost of building and machinery, $75,000.

Several centers of the Ventura County farm bureau are starting Lima bean seed selection to produce more uniform and increased production.

J. B. Vaile, for two years president Los Angeles County farm bureau, has bought a date orchard near Coachella and will move there from San Dimas.

Brant Rancho Guernsey milk won at the state fair first and gold medals in guaranteed milk and cream classes and for highest scoring exhibit of milk and cream.

Under orders from the state railroad commission the Southern Pacific reduced freight rates between Los Angeles and Imperial Valley points, beginning September 20.

Adohr Stock Farms won at the state fair first on certified milk. City Dairy of Pomona and the Italian Vineyard Company won the raw and pasteurized market milk classes.

The state railroad commission ordered the Ventura County railway to reduce rates on carload shipments of beets, from all points to Oxnard, to the rate allowed in 1920.

An inventor has been demonstrating a machine for printing names on oranges, in Orange County, and the machine has been favorably reported on by a Villa Park committee.

A dairy census of Imperial County shows two-thirds of the dairymen are Americans, 47 per cent are owners of the land, and 43 per cent of the bulls used are registered purebreds.

## The Coast and General

The Oregon Milk Producers is considering reopening its plant at Portland.

Flagstaff, Arizona, expects a good yield of potatoes, due to long continued warm weather.

Yakima, Washington, is making plans for an ambitious potato and corn show in November or December.

Idaho sheepmen say they are selling tens of thousands of dollars worth of lambs every week in Chicago and Omaha.

Reports from Flagstaff are to the effect that stock are in good condition and that the range should be in excellent shape by winter.

Agricultural conditions in the Yuma, Arizona, districts are very generally good, though heavy September rains in some places caused crop damage.

Paving of the Salem to Dalles, Oregon, highway in Polk County, Washington, has been completed. It is one of the busiest stretches of highway in the state.

The Yuma County farm bureau has fixed price of $1 per 100 pounds for picking short staple cotton for first picking. Salt River Valley growers fixed same price.

Potato growers of Umatilla County, Oregon, are planning a Potato Day, to be held in Weston some time in October when seed potatoes of certified crops will be displayed and experts and buyers will be invited to attend.

New Mexico this year has the largest acreage of Pinto beans in its history—estimated to be 25 per cent greater than the 1921 acreage. The Mountainaire district leads with 45,000 acres. There are 20,000 acres around Willard.

Torrential rains in the Chocolate Mountains washed out main irrigation canal, cutting off water from the San Pasquale and Yuma valleys of Arizona, but as the rain was general in that district, little damage to crops is expected to result.

Members of the Walla Walla, Washington, farm bureau have announced that they will open a public market this fall. The market has been incorporated under the name of the Producers' Public Market. It is capitalized for $30,000.

Heavy showers have fallen in the north central portion of Arizona and moderate showers over remaining parts of major grazing areas. Range and stock are reported good in the Grand Canyon, Williams, Pinedale and Douglas sections and water supply adequate.

Agreements have been made between the apple growers and the port of Seattle whereby 1,000,000 boxes of this year's apple crop will move to American and foreign markets by steamers. Of the 1921 crop 375,000 boxes were shipped by boat and in 1919 only 2000 boxes were handled over Seattle docks.

Unlike the seasons of 1917, '18 and '19, the passing of summer this year was unaccompanied by damaging winds and rain in Arizona. And, though heavily loaded with green bolls, as a whole the cotton is not tangled and lodged; nor has mildew taken much of the bottom crop. The top branches are set heavily.

# Central California Citrus Institute

By W. R. Wood

THE house was packed to the doors. There were citrus growers from all parts of the San Joaquin Valley. Many have been engaged in citrus culture since the first commercial orchards in the valley were planted. Others have less experience. All were eager to learn what they could concerning the problems confronting the growers.

It was the first Central California Citrus Institute which opened at Lindsay on Wednesday, September 6. C. M. Conner, farm advisor of Tulare County, called the meeting to order and briefly stated its purpose. He told those present that, if in their opinion, this first institute was a success, he would endeavor to make it an annual event.

A glance at the program showing the different speakers and the subjects to be covered by them convinced me that those present were going to hear something worth while. My only wonder was that there were not even more present.

W. B. Kiggins, vice president of the Lindsay Chamber of Commerce, extended welcome. He expressed the hope that this meeting might be of such benefit to those engaged in citrus culture that they would be held annually. The citizens of Lindsay would be glad to have their city selected as the meeting place for future institutes.

R. S. Woglum, entomologist for the California Citrus Fruit Exchange but formerly with the United State department of agriculture, in the study of pest control and fumigation, read a very interesting paper on "The Need of Better Pest Control." To those of us who were acquainted with Mr. Woglum's work, his paper was of particular interest because his long and close study places him in a position to give facts and figures that can be relied upon. He reviewed the pest situation in Central California from the time of the first commercial plantings, when it was thought that, due to the summer heat and low humidity in the valley, no citrus scale could live. He referred to the rapidity with which the citricola (gray) scale had spread over the entire valley, also the spread of the citrus thrips (Euthrips citri). The damage suffered by the industry in the San Joaquin Valley has been enormous. In addition to the loss in quantity, size and quality is very materially lowered.

Prior to the infestation of these two pests it was not uncommon for an entire orange crop to go 90 to 95 per cent fancy, whereas badly infested groves now only produce from 10 to 15 per cent fancy fruit. He stated that the loss due to the work of thrips alone exceeded $200,000 per annum. The effect of citricola scale is hardly less noticeable, as an illustration he gave the production and grades from one orchard. When practically clean it produced 1393 boxes of fruit which graded 70 per cent fancy, 26 per cent choice and 4 per cent culls. The next year the crop was somewhat heavier being 1793 boxes but due to the effect of the scale it only graded 26 per cent fancy, 50 choice and 24 culls. The third year the scale had so reduced the vitality of the trees that they only produced 193 boxes of fruit.

As a control measure for thrips he recommended spraying with a 2 per cent lime-sulphur solution. The addition of nicotine sulphate spray or miscible oil has proven to be helpful in the control of this pest, three applications being necessary if satisfactory results are to be obtained.

For the control of citricola scale he considered fumigation best but by the proper application of sprays it could be held in check, however, two sprayings per year would be necessary to accomplish anything like satisfactory results.

The success of either spraying or fumigation depends upon having the work done at the right time and in an efficient and proper manner. Mr. Woglum urged the adoption of an effective and uniform pest control policy and tried to impress upon those present the necessity of following out such a policy in order to accomplish uniform results.

Frank Brann, horticultural commissioner of Tulare County, read a paper on "Practical Results in Control of Citricola Scale in Central California." Mr. Brann's paper covered the subject so thoroughly that it is given almost entire below.

A. J. Flebut, entomologist for the federal department of agriculture, spoke on "Control of Citrus Thrips." He has been at work for some time trying to find some satisfactory dust spray for the control of thrips and told of his experiments and the results accomplished. Some sort of dust spray is necessary or desirable, he said, on account of the rapidity with which the thrips multiply and spread when once they begin to appear in the spring. Due to rains or irrigation it is often not possible to get into the orchards with the heavy spray rig at the proper time. With the dust spray the equipment is much lighter and easier to handle. A much larger acreage can also be covered than is possible with the liquid spray.

To date, however, they had not been able to get results from the dust spray that would justify recommending its use. The experiments are to be continued, and Mr. Flebut told the growers that they still had hopes of securing effective dust treatment.

Dr. P. A. Boncquet is still at work on his hobby, "Control of June Drop," and read a paper entitled "Progress Report on June Drop." After several years of investigation he has come to the conclusion that the June drop is caused by a fungus, by name, "Fusarium Aurantii" and that by controling this fungus the growers troubled with June drop will be at an end. He stated, however, that the fungus did not cause any serious loss of fruit unless the trees were in a weakened condition and that by proper care and fertilization the trees could be put in shape to resist this fungus. Frost damage, particularly late spring frosts, he stated were conducive to the attack of fungus and in his opinion summer cover crops put the trees in a poor condition to resist frost.

The doctor may be right about this but time will tell as I noticed many orchards with summer cover crops. The

(Continued on Page 310)

# Walnut Growers Picnic

By Ernest Braunton

THE second annual field day of the California Walnut Growers Association was held in Tucker's Grove, Goleta, about seven miles north of Santa Barbara on September 2. The program was carried out nearly as first announced, but regret was expressed by many that C. C. Teague, the president, could not be present. About 825 were present, exclusive of 100 Boy Scouts detailed to wait upon the visitors. An audience of good size listened to the speakers and the only uneasiness it manifested was when the breezes wafted its way the appetizing odor from the barbecue pits.

The address of welcome was made by E. W. Stow, Goleta, who said that Santa Barbara County was the first American home of the Persian walnut. In 1858 Russell Eaton, in Carpinteria Valley, grew the first seedlings, hardshells of course. In the late '70's Joseph Sexton developed the Santa Barbara soft shell, the forerunner of all the present good varieties.

### The Assigned Speakers

Robert W. Hodgson, farm advisor of Los Angeles County, told of the extension work of the state university.

The 1922 season's outlook was presented by W. T. Webber, sales manager for the association: "The citrus, raisin, and prune people ship more dollar's worth of output than the walnut growers, but owing to our perfect organization we are as well known as any of them, for our operations are on a finely organized base. The present crop is the 'largest ever.' The past few days of very hot weather will cause some damage, especially in Los Angeles County. Coastal regions will suffer less. Dark colored meats and stick tights may result, yet still it will be our largest crop."

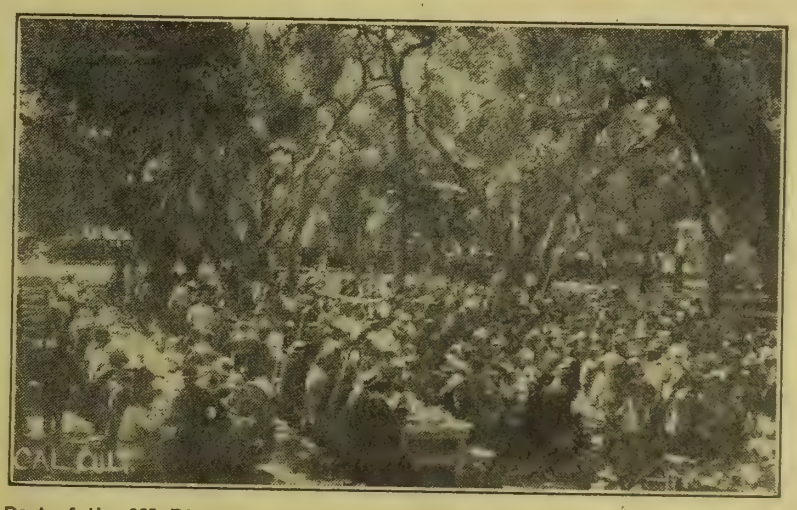
Mr. Thorpe has been visiting in the world's largest walnut districts. He reports that France, the largest producing country, has double the crop of last year, and the same is true of Italy. The Balkan states and Turkey produce many nuts. A few years ago Turkey surpassed California's production but we didn't know it as the crop is marketed as French nuts. Foreign competition will be keen and we need protective legislation. That now pending asks for four cents a pound on unshelled and 12 cents on the meats. Foreign competition is growing each year; foreigners grow for less and the present rates of exchange favor them. The railroad strike, even if settled today, will probably affect the shipping of walnuts. We have secured ample steamer space, if needed, for our full crop, but if a general strike comes the longshoremen will not load the steamers and the steamers cannot transport our crop.

"The 1921 crop was 20,000 tons; the 1922 crop will be 30,000 tons. The sales outlook is puzzling and problematic on account of strike conditions, but prices will be lower than last year. All California products are lower this year as dealers protested first prices and they tumbled. Protests will pull the price of walnuts down five cents, whereas a one cent lower price at the start would have avoided protests, so we shall proceed with caution. Growers should remember that five per cent poor nuts will bring prices down 20 per cent, so be careful of the pack. Appearance, as in all products, is the first consideration. It pays to thin closely planted orchards. Taking out every other tree has resulted in the orchard's biggest crop the second year after the change".

Geo. E. Farrand of the California legislative committee was presented as substitute for C. C. Teague who could not be present.

As his talk was largely along legal lines, and not crop production or marketing, we are not quoting him at length, but he closed with an eloquent plea for an equal chance for all men in every walk of American life, and so impressed the audience that a request was made that his speech be printed in full and mailed to all members of the association.

H. C. Sharp, inspection department of the association, said the 1921 crop was the poorest for many years, especially in quality and size, and the sales had fallen off materially. In January, 1920, there were 100,000 bags unsold. By March all were sold, and eaten. During the same months this year (1921 crop) but 30,000 bags were consumed. Do not let walnuts remain too long on trees, pick when ready and cure properly. No change in treatment has come in late years except less water is being used to hull nuts. The water stains the meats and shells and makes curing more difficult. The present most pressing need is better methods of curing. Artificial drying plants are increasing in number.



Part of the 825 Diners at the Recent Walnut Growers Field Meet at Goleta
After cracking walnuts figuratively, speakers and listeners lunched literally.

### Field Demonstrations

After the "big feed" Prof. R. E. Smith of the state college of agriculture told of the latest development in dust spraying for control of insect pests. A machine near by gave a practical illustration of orchard spraying.

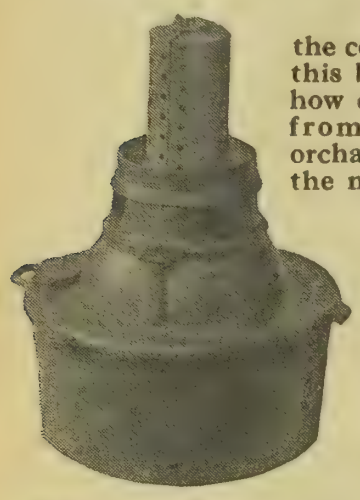
E. S. Kellogg, horticultural commissioner of Santa Barbara County, showed in the orchard the results of using different stocks and the behavior of the leading varieties on those stocks.

Prof. J. W. Nelson of the state college of agriculture held his usual large crowd of interested growers by his simple but forceful explanation of soil problems. He said all orchards need irrigation. About July 10 unirrigated trees cry for water and roots travel far, too far, to reach it. A trench dug in a near by alfalfa field showed walnut roots were plenty, though nearest tree was more than 100 feet away. Every orchard not now irrigated is needing it badly right now. Irrigation would greatly increase the state's output which now averages but 600 pounds an acre. Irrigation could increase this by at least 200 pounds, and at 20 cents a pound this would mean $40 an acre greater income. The great needs are water and organic matter. The tree top continues to function 100 per cent. but in the unirrigated orchard but 30 to 40 per cent. of the roots can function from now to shedding of leaves. So trees are forced to reduce their demands and thereby suffer heavily. Some use too much water. One ranch in Inyo County was shown to be using 15 acre-feet this year. Professor Nelson advocates both summer and winter cover crops, as a single crop but holds soil in present condition.

# THIS ORCHARD HEATER

## Makes No Smudge

No Soot Forms in the Burner Pot or Stack.



Study the construction of this burner. Note how different it is from any other orchard heater on the market.

## The KELL-OIL Heater

### HAS WON THE CONFIDENCE OF GROWERS IN ONE MONTH IN SOUTHERN CALIFORNIA

Down in the Citrus groves of Florida the Kell-Oil Heater is well known and is the only heater in general use there.

It has been in use there for several years, and its high quality and complete efficiency are recognized.

But only recently has the Kell-Oil Heater been introduced in Southern California. Notwithstanding this fact it has been received with enthusiasm by growers here, and wherever shown it has demonstrated conclusively, under the closest observation, its superiority to any other heater now in use.

Many growers concede that had their groves been equipped with Kell-Oil Heaters last winter the saving to them would have more than paid for the equipment in the one season.

We have conducted exhaustive experiments with various heaters in comparison with the Kell-Oil Heater and, this also has been done by others who are experts in the citrus business and we know that because of its widely different principle of construction and the seven inch stack used that it delivers 40% more heat and radiation and delivers the heat closer to the ground with less fuel consumption than any other heater yet placed in competition with it.

The economy of Kell-Oil Heaters goes farther than the mere saving of fuel. It requires less heaters to the acre to produce the necessary amount of heat to raise the temperature above the danger mark and thereby reduces the cost of operation and labor. Kell-Oil Heaters are built in three sizes and have capacity to burn from eight to twenty hours. They are so constructed that they may be refilled while burning. These heaters are the least expensive heaters to own because they are made of cast "Strokel" iron and will last a life time. No loss of equipment to figure because of damage by rust or careless handling—no painting to do—they are easy to clean and the stack being of heavy galvanized material will last for years.

WHEN YOU FIGURE

The saving in labor
The 40% greater heat and radiation
The Economy, Safety and Efficiency
The low upkeep
The Long life and the burner construction

There is only one answer to the problem of Frost Protection for your grove.

### BUY KELL-OIL HEATERS

and save your crop year after year without the need of replacements. Order your equipment now, many growers have already placed their orders. Our allotment for this year will be limited but deliveries will be made in time for this year's use if you order early.

Ask for demonstration, or write for illustrated literature.

**Don't allow yourself to be rushed into a contract to buy orchard heaters until you have seen the Kell-Oil Heater.**

## CENTRAL CALIFORNIA CITRUS INSTITUTE

(Continued from Page 309)

growers will be able to see next spring how it affects their crops.

It has been the writer's observation that orchards in the most healthy condition not only hold their fruit better but suffer less from frost. If cover crops benefit the trees they should help them to resist the frost damage, excepting of course, in cases where the soil was allowed to dry out in the summer and the later irrigations induced a late growth on the trees. Anyway we hope the doctor succeeds in finding a control method for putting an end to June drop. We can assure him that the growers from North to South will raise as a unit and call him "Blessed."

At the afternoon session Gordon Surr, field assistant in orchard management, citrus experiment station, Riverside, spoke on "Fertilization Problems of Citrus." He gave the results of the different experiments being carried on. These clearly show that manure and cover crops together with nitrogenous fertilizers applied in the spring were giving the best results. Complete fertilizers had shown some good results but in his opinion it was largely due to the amount of nitrogen they contained. He recommended application of manure in the fall or early winter as being most beneficial, and also insisted that results obtained from manures and fertilizers depend largely upon proper cultivation and care of the grove. When asked regarding the use of lime, he stated that they had been unable to see any results from its use excepting in the physical condition of the soil. He thought that in some instances the lime had a tendency to lock up the iron in the soil and make it unavailable to the tree.

R. S. Vaile, assistant professor in orchard management at the citrus experiment station, evidently saw that the heat of the afternoon together with the hearty lunch of which most of us had partaken, was making the audience somewhat drowsy so he prefaced his talk on "Irrigation Practices on Citrus Soils" with a number of jokes. They had the desired effect, judging from the number of questions asked at the conclusion of his paper.

He gave the result of investigations made in regard to amount of water necessary to keep citrus trees in good condition and stated that in his opinion many growers especially those having heavy adobe soil were using too much water for the good of the trees. Soil of this nature, he thought, should not have more than from four to six acre inches per irrigation and that 48 hours was a sufficient time for the water to be on the ground in order to penetrate to the desired depth. An irrigation of this kind every four weeks with proper cultivation between times, is sufficient to keep citrus trees in the best of condition. On the brown or red loam two acre inches per irrigation is all that is necessary in order to wet the soil to the desired depth. It should be applied every three or four weeks and where cover crops are being grown, every 15 days. Investigations have shown that water put into the soil below the root area was lost to the trees as this moisture does not rise. On gravel soil he advised the use of three to five acre inches of water applied every 30 days. Best results from irrigation may be had only when followed by proper cultivation.

Grant Phillips, manager of the Venice Cove Ranch, spoke on "Fertilization and Cultural Practices" as carried out by him on his ranch. This orchard was in poor condition when Mr. Phillips took over its management. Many of the trees were producing less than a box of fruit. By spraying twice each year he raised the quality of the fruit from 60 to 90 per cent fancy and by making heavy applications of manure followed with nitrogenous fertilizers he increased his crop from 8214 boxes in 1918, or an average of 1.9 boxes per tree, to 17,435 boxes in 1921 or an average of four and two-thirds boxes per tree. He recommended the application of manure in deep furrows so that it would become available much more quickly, also result in less loss from drying out as is the case when spread on the surface.

The afternoon meeting closed with a talk on "Cover Crops" by W. R. Schoonover, extension specialist in citriculture. He emphasized the necessity of supplying organic matter and stated that cover crops gave the only means of supplying the proper kind and amount. He advised growing cover crops when trees are first set. Have the soil well enriched when the trees come into bearing. He advised the growing of two cover crops per year where the water supply is sufficient. Due to the fact that as the soil fertility decreases the water requirements increase, he thought that no more water would be required to properly irrigate an orchard and cover crop, where the soil had been kept well supplied with organic matter, than if the soil had been allowed to become impoverished from a lack of organic matter. He cautioned growers against the practice of allowing wild oats or other cereals to grow as they not only seriously injure the trees while growing but do not supply the proper kind of organic matter for citrus tree suport. Cereal straw retards instead of aids the work of the soil bacteria. Nitrogenous cover crops increase the activity of this bacteria. Winter cover crops should be turned under not later than March 15 in order to get best results. If left later than this they deprive the trees of necessary plant food and also become less valuable for turning under.

The evening session was turned over to Dr. H. J. Webber who spoke at some length on the influence of stock on growth of trees. He explained the experiments being carried on by the experiment station and illustrated his talk by showing stereopticon views of both seedling and budded trees, all grown under ideal conditions, but clearly showing the difference between good and poor root systems. He stated that they were now making investigations and carrying out experiments with a view to finding citrus root stocks that are not only resistant to root diseases but that will impart additional vigor to the bud and thus produce trees more uniform and vigorous than on sour orange root. He urged those intending to plant new groves to buy nothing but the best and most vigorous trees obtainable.

At the conclusion of the meeting the chairman asked for an expression from those present as to whether they wished these institutes made an annual event and it seemed to be the unanimous verdict that such was the wish.

Everyone went away feeling that he had spent a profitable day and those with whom I talked were loud in their praise of the work being done at the experiment station and by the field men of the department in their efforts to assist the citrus growers in combating pests and diseases and other difficulties confronting citrus culture.

## PLACER COUNTY FRUIT GROWERS

Even better than the convention of a year ago will be the second annual fruit growers convention, which has been set for October 4 and 5 at Auburn. The program is nearing completion. There will be two sessions a day.

Problems which were discussed in convention last fall have been worked out during the past year and will be reported on. These problems are peach twig borer, long pruning, cost of production of a box of fruit in Placer County and others.

Other topics: Soil Management, Irrigation, Cover Crops, Plant Food, Pollination of Plums, Observation on Eastern Markets, Training of the Young Pear Tree, Tree Troubles in Placer County, report of committees appointed at the last convention, Crop Reports, fruit exhibit for state fairs.

## VALLEY WINS IN POWER FIGHT

After more than a year of contention an agreement has been reached between Los Angeles and commercial organizations of the San Joaquin Valley whereby applications for power sites on the Kings River will be held in abeyance for an indefinite period. Two years ago Los Angeles filed on a number of sites on Kings and Kern Rivers to develop power for the city

of Los Angeles. Applications were resisted on the ground that a prior use could be made by the irrigation interests of the San Joaquin Valley. Following two hearings before a joint commission of the federal power commission of the state water board, representatives of the city of Los Angeles agreed to have their applications go over to an indefinite date with the understanding that if they interfered with the irrigation plans of the valley the same would be withdrawn.

### CONTROL OF NEMATODES

Prof. J. R. Watson of the Florida experiment station announces that he has found a means of controlling nematodes.

His remedy is a simple one: Grow the land to bunch velvet beans during summer, keeping the soil constantly stirred; you will thus eliminate the worms and improve your land at the same time.

There are at least three fundamental principles involved in the control of the nematode, according to Professor Watson. First, the worm hatches from eggs. To hatch these eggs requires warmth, air and moisture. Fail to provide any one of these three things and there will be no hatching, although the eggs will continue to live. Second, the worms do not live upon the roots of all plants. The velvet bean is one of the plants that is immune to the nematode. Third, soil kept exposed to the hot sun is "burned-up" or depleted of its soil life.

These principles give rise to the following directions for what seems a most practical and economical method of controlling the nematode:

Upon infested land grow crops that are immune to the nematode. Bunch velvet beans are preferred for this.

Keep that soil constantly stirred. This permits air to reach the eggs and the worms. The eggs hatch out and, denied the food they demand, the worms starve.

### HARVESTING SORGHUMS

Four methods of harvesting Yolo will be demonstrated at the University Farm, on Saturday, September 30, at 10:00 a. m.

The principal handicap in the production of grain sorghums and kafirs has been the expense of harvesting by hand methods. This was formerly necessary in California where the crop grew in such an irregular manner that machines could not be satisfactorily used to harvest the crop.

Yolo, an improved type of Egyptian corn, is the result of a six year experiment in the development of a crop which will grow to uniform height with erect heads. It can be very easily and efficiently harvested with a number of machines. Among the machines to be used at the demonstration at the university farm are one row headers built by John Deere Plow Company, Ventura Manufacturing and Implement Company and the Reschke Machine Works. McCormick push headers will also be used in this demonstration and perhaps a combined harvester.

About 40,000 acres of Yolo have been planted in various parts of California this year. Reports to date indicate that it is yielding well and can be easily harvested by machinery.

Data may be obtained at the university farm demonstration on the power required to operate the various machines, together with some estimates on comparative costs.

### PRUNES DYING—GUMMING

More information is required by prune growers. Trees are dying. Why? C. B. Francis of Gridley writes: "I have lost about 40 prune trees from this disease and others are dying. Early this spring I noticed the trees breaking out with this gum. I then called over our farm advisor and we made an examination and found they were dying just above the graft, working up and around the tree. First one limb would die then another until the tree was all gone. He said it might be caused from the weather but I think that had nothing to do with it. There are hundreds of prunes dying in the same way all over this country, and no one has found the reason or how to stop them."

In addition to Dr. Snowden's reference to "Gumming of Deciduous Trees," comment was given in the Cultivator on pages 261 and 263.

### CROP DEPENDS ON IRRIGATION METHODS

The method of applying water may be the deciding factor between the success and failure in 90 per cent. of the California citrus orchards, according to recent investigations carried on by the University of California. A detailed report of this investigation can be found in Bulletin 341.

"The results indicate that irrigation furrows, which exceed 250 or 300 feet, are undesirable. Furrows of greater length tend to make the soil at the upper end too wet and the soil becomes "water-logged," thereby causing irregular growth in the orchard and smaller average crops. A portion of the soluble plant food will be leached and carried below the reach of the roots."

The great difference in the physical condition and the moisture content of soils makes it advisable to use great care in the cultivation. Soils should not be stirred while wet, but should be allowed to remain undisturbed until sufficiently dry to permit thorough and deep cultivation.

### BOOSTING OLIVES

The California Olive Association proposes starting an advertising campaign among the retail grocers of the United States, also a series of educational exhibits and free demonstrations of ripe olives in some of the large eastern cities for the purpose of acquainting the consuming public with the ripe olive.

The Cultivator heartily commends any and all legitimate efforts put forth to again place the California ripe olive in its proper place as a delicious and nutritious food. Now that it has been definitely determined that there is absolutely no danger of botulism poisoning when ripe olives are properly put up, let us all put our shoulder to the wheel and keep boosting until the consuming public is made acquainted with the fact that there is less danger from eating canned olives than from almost any other canned product and that California ripe olives are a healthful and appetizing food for both old and young.

And while this educational campaign is going on the growers and packers must do their part to see that nothing but the best is put up and that when a purchaser buys a can of California ripe olives he knows that he is getting something that he can depend upon as being all that it is represented to be.

By adhering strictly to this standard the olive industry will again come into its own and the demand for California ripe olives will steadily increase until the demand will exceed the supply.

---

Fresno shippers estimated that the recent slump in eastern prices cost California grape shippers at least $700,000.

---

Humid weather during the first week in September caused a heavy drop of cotton bolls.

---

"Every forest fire affects every citizen," says District Forester Redington. "The tourist travel into the mountains of California during the past summer totaled in round figures a million and a half. Tourists will not seek the mountains if they are to be greeted with charred tree trunks.

"Thousands of cattle are annually pastured within the national forests, and if their feed is destroyed the cost of producing meat advances.

"Lumbering is annually becoming a more important industry in California, but if fires destroy or damage the trees unemployment will ultimately follow in the wake of this destruction.

"California depends largely on irrigation for its great crops. Streams originate in the forests which serve to hold back water to run off gradually during the summer. If the forests are burned the water makes a rapid run-off, causing erosion of our mountains and a lack of water when it is most needed."

---

More than 50 vegetable growers and shippers of Southern California met at Oxnard last week to discuss vegetable crops for districts other than Imperial and Coachella Valleys. Charles Donlon gave them a barbecue feast.

# TEXAS GULF SULPHUR

## Best for Agricultural Use

CRUDE SULPHUR — FLOUR SULPHUR — INOCULATED SULPHUR

**Direct Shipments From Portland, Oregon**

As the world's largest producers of sulphur we can serve you best. Texas Gulf Brand contains 99½% pure sulphur and is supplied in three different forms, as above.

We will give your dealer or county agent full cooperation.

Write us in detail regarding your sulphur requirements or wire us a night letter, charges collect, stating alfalfa acreage, kind and amount of sulphur you will use, name and address of dealer or county agent. We will promptly supply information and quotations.

**Sulphur Book and Other Helpful Literature—FREE**

**TEXAS GULF SULPHUR CO.**

41 E. 42nd St. New York City

# Of special interest to home builders

*New book of home plans now ready*

*House No. 361—a very popular design—a Tumwater home*

Remember, if you can drive a nail, you can build your own home from modern plans and readily prepared material which we furnish. Get the Tumwater Home Builders' Book; by sending in the coupon you start on the road to the possession of a beautiful, well constructed home.

Send 25c in coin or stamps for our "Wonder Book" dealing with the all-absorbing subject of building your own home. This book contains designs of homes you would be proud to own; also floor plans, etc. In this book is represented the combined knowledge and experience of six famous specialists in architecture, lumbering and actual building construction. The homes illustrated are more than just homes on paper—they're actual photographs of ideal and practical places that the Tumwater Lumber Mills have built for hundreds of pleased customers. Although this book is offered for the very low price of 25c, it may be the means of saving you hundreds of dollars. Send for it today.

**Real homes—and the builders of them**

*From the Olympia Daily Recorder*:

The work the six Anderson Brothers of Tumwater are doing in the manufacture of modern day homes, has significance for Olympians who look expectantly to the future. These men have something which avoids waste of natural products, which opens the way for other natural development, and which will spread the name of Olympia and the adjacent town of Tumwater far afield as the home of industry whose products hold promise of being sold everywhere.

SILO-FILLING—AND GOODYEAR BELTS

*The most satisfactory* belt he has ever used, says Harold H. Holtzman, of Wheaton, Illinois, is the Goodyear Klingtite Belt. First he threshed with it, then used it in silo-filling, corn-shelling, hay-pressing, feed-grinding and wood-cutting.

*"It is a powerful belt,"* Mr. Holtzman reports, "delivering steadily and sturdily the full power required for the cutting and for forcing the ensilage up the stackpipe. It holds the pulleys in a slipless grip, yet runs freely, so that there is never any worry about overheating the engine bearings. It performs the same in any weather." Goodyear Klingtite Belts need no breaking in. Their special construction so distributes the load that ply separation is unknown to them. They outwear ordinary belts, and earn their reputation as the best help on the farm.

*Efficient, economical* Goodyear Klingtite Belts come in endless type for all heavy duty and in suitable lengths for water-pumping, cream-separating, churning, electric lighting plant, washing machine and other light drives. For further information, write to Goodyear, Akron, Ohio, or Los Angeles, California.

# New Canning Peach

The Southern California Canners Bureau is recommending a liberal tryout of a new peach said to possess exceptional canning qualities. Prof. G. P. Weldon and Frank A. Dixon, who is director of experimental horticulture for the Canners League of California, S. W. Cunningham, secretary of the bureau, and others recently made a critical examination of fresh and canned samples of principal varieties. Regarding this examination Secretary Cunningham writes:

"A comparative cutting of these peaches showed in both the fresh cutting and canned samples that the Paloro peach is head and shoulders above any other for canning purposes. It seems to have every desirable quality from the canner's point of view. All the information that we have regarding this peach is to the effect that it makes a strong, sturdy tree and is vigorous under various conditions. The plantings that have been made in the North, and which are coming into bearing, have consistently produced good crops, and when properly cared for and thinned as high as 90 per cent of the fruit has gone into the choice and fancy grades of canned fruit. These are the desirable grades for both growers' and canners' best interests.

"Other peaches examined at this meeting, which seemed to be very promising, were the Peak and Simms. These are desirable from a canner's point of view not only because they appear to be quite good producers, but because they ripen at a period when there are no other canning clingstone peaches now available and it is the earnest desire of the canners not only in Southern California, but in the state as a whole, to secure the planting of good canning varieties of yellow clingstone peaches that will ripen between the present Tuscans and Phillips. The Peak appears to be better than the Simms both as to tonnage production and canning qualities.

"In addition to the varieties mentioned above we have several other new and apparently promising seedling peaches under observation but which have not progressed far enough yet to warrant drawing any conclusions as to their usefulness.

"It is our intention as an organization to urge upon growers who are putting in new plantings that they give serious consideration to varieties ripening in the above mentioned period, in order that canners may eventually get away from the necessity of using, between the Tuscan and Phillips, freestone peaches which are not so desirable for canning and do not find as ready a market in cans as do the yellow clingstones.

"We call this matter to your attention at this time because we know that nursery stock is now being budded and it may be that as a result of this organization, representing most of the canners of Southern California, urging the planting of mid-summer varieties of clingstones, there will be more demand for such trees than there has been in the past."

# Cover Crop Fertilization

The United States department of agriculture announces the publication of a new bulletin on "green manuring" by C. V. Piper and A. J. Pieters. Farmers interested in this method of soil fertilization should not fail to send for a copy. The bulletin contains more than 40 pages of valuable information on the different plants found useful for this purpose and the ways of handling them; also tables of results that show their value in increasing returns. A copy may be obtained free by addressing the department of agriculture, Washington, D. C. Ask for "Farmers Bulletin 1250."

These crops that are grown primarily as roughage for feeding the soil produce both chemical and physical effects that are of benefit to plants that succeed them. When a green manure crop is turned under, the various fertilizing elements that have gone into the making of the crop are returned to the soil, and a quantity of organic matter not before in the soil is added, and, in addition to improving the physical condition, serves as food for beneficent bacteria. One of the most important functions of organic matter in the soil is to keep up the nitrogen supply. The bulletin gives three ways in which this is done: Growth of nodule bacteria on roots of leguminous plants; the making of nitrates by soil bacteria from organic nitrogen in the soil, and growth of bacteria and molds that feed on plant waste in the soil and take nitrogen directly from the air. These processes may be stimulated by adopting the proper practices and suitable crops.

Legumes are of course the most satisfactory cover crops under most conditions, and all legumes do not have the same strain of nodule bacteria. For instance, that of clover is different from that of alfalfa, and that of the cowpea is distinct from that of the soy bean. These selective associations of plants and bacteria make inoculation of the soil necessary where the crop has not been previously grown either by scattering soil from a field where the crop to be sown has been grown recently or by using an artificial culture. A strain of bacteria will often inoculate different closely related legumes. Alfalfa, burclover, and sweet clover nodules are produced by the same strain; a different strain inoculates most of the vetches, as well as the field and garden peas; still another strain is apparently used in common by red, white, alsike and crimson clovers.

The question often arises, whether a crop should be turned under for green manure, fed on the farm, or sold as hay. The authors sum up the argument as follows: Where a forage crop can be grazed or advantageously fed and the manure returned to the land, this will be found most profitable. Where insufficient livestock is kept or where the soil is poor and in need or organic matter, a green crop may often be worth more if turned under. It is known that the turning under of a green manure crop may affect the yield of subsequent crops even to the third year, and this fact should have weight when the question of selling a legume hay crop or turning it under is considered.

## TUOLUMNE COUNTY APPLE GROWERS

The apple growers of Tuolumne County are now fully organized in the Tuolumne County Apple Growers Association. Already there is 50 per cent of the apples produced in the county represented in the membership. The apples were packed in six different packing houses. One of the affiliating associations is known as the Bret Harte Apple Packers Association. This is located near Ralph's Station.

Horticultural Commissioner H. H. Sherrard writes: "In addition to following the California apple standardization act the association will adopt some regulations of the Northwest pack and make it plus. Approximately 75 per cent of the California apples is produced in the Watsonville district at a low altitude and are principally Bellflower and Newtown and 15 per cent of the apples is produced in Sebastopol and are practically all Gravensteins, leaving 10 per cent produced in the remaining sections of the state, which are mostly the foothill sections and are practically identical with Northwest conditions. The Tuolumne County growers feel that their chief competitors are the Northwest apple producers in the states of Washington and Oregon, hence, the adoption of high standard packing regulations. Very careful inspection is going to be made of the Tuolumne County apples in order that buyers and consumers will be assured of high quality apples, which are generally recognized to be produced in the foothills.

Some good offers have already been made for the Tuolumne apples and

many more buyers have stated that they will bid for them. The Macomber Cider and Vinegar plant at Sonora has planned to use all the cull apples.

### AMERICAN POMOLOGICAL

The 39th convention of the American Pomological Society will be held at Council Bluffs, Iowa, November 15-17. Following is tentative program:

. Addresses by Dr. L. H. Bailey; Secretary of Agriculture Wallace; J. R. Howard, president American Farm Bureau Federation; Paul C. Stark, Missouri; E. S. Briggs, American Fruit and Vegetable Shippers Association, Illinois. Fruit Stock Investigation, L. B. Scott, Washington, D. C. Fundamentals of Pruning, Dr. E. J. Kraus, Wisconsin. Correlation of Orchard Practices with Growth and Production, Dr. R. H. Roberts, Wisconsin. Blight Resistance in Pears, H. P. Stuckey, Georgia. Apple Breeding for the Mississippi Valley, Prof. S. A. Beach, Iowa; Dr. C. S. Crandall, Illinois. Sour Cherry Industry, M. B. Goff, Wisconsin, Prof. R. E. Marshall, Michigan. Plum Industry, East, Dr. U. P. Hedrick, New York. Middle West, B. W. Douglas, Indiana. Northern Prairie Region, Prof. N. E. Hansen, South Dakota. The Pacific Coast, A. N. Hendrickson, California. Use of Spreaders, Dr. W. A. Ruth, Illinois. Dusting and Spraying as Complementary Practices, Prof. W. S. Brock, Illinois. Drift and Development of Spraying Practices in America, Prof. Leroy Childs, Oregon. Home Storage of Fruits, E. C. Cotton, Ohio. The Proper Handling of Fruit in Storage, J. R. Magness, Pennsylvania. Survey of Fruit Conditions, Pacific Northwest, M. L. Dean; Middle West, Prof. Laurenz Greene, Indiana; Annapolis Valley, Canada. W. S. Blair, Nova Scotia. Horticultural Trip Through the Land of Evangeline, Prof. J. C. Blair, Illinois. Advertising as a Factor in the Development of American Horticulture, C. I. Lewis, Illinois. Apple Industry of the Country, H. P. Gould, Washington. European Pomology, Dr. U. P. Hedrick, New York; Dr. W. L. Howard, California. Reports of Committees of Nomenclature, Wilder Medals, Fruit Shows, Slogans, New Fruits, Foreign Fruits, etc.

### POTASH PROTECTS FROM FROST

A recent article on "Pineapple Problems in Florida," contained the following: "Up till 1915 the industry brought in about one million dollars annually to St. Lucie County, but after that time many of the fields have become unprofitable owing to lack of potash fertilizer, an essential element in the cultivation of pineapples which invariably renders them more resistant to cold. By applying ammoniates without potash, the plant appeared to become tender and very susceptible to injury from frost. The grower was reduced to the use of blood and bone tankage, etc., owing to the exorbitant price of potash, and the severe frosts of 1917 led the grower to despair of success."

If potash renders pineapples resistant to frost injury to such a marked degree, what measure of protection will it afford citrus, walnut and other trees? Dr. Van Slyke, chemist of the New York agricultural experiment station, states in his book "Fertilizers and Crops," that "in general, crops which do not receive their full supply of potassium are more liable to disease, and in this condition the resisting power is weakened still more if the plant receives large amounts of available nitrogen." If resistance is weakened by lack of potash and excess of nitrogen, what of the reverse supply, little nitrogen and much potash? Will the "resisting power" be thereby greatly strengthened? It has always been claimed that potash aids maturity of seeds, fruits and woods. If nitrogenous fertilizers are applied early in the summer and potash later, when the nitrogen is exhausted, will all plants thereby become more resistant to frost, as is undoubtedly the case with pineapples?

The owner of a new cherry orchard at Yakima, Washington, has contracted with Libby, McNeill and Libby for the entire crop for 15 years at $120 a ton.

Fall & Winter 1922-23

## Don't You Miss this Money Saving Opportunity

# This Catalogue is Yours FREE

### Buy from this Book

This Golden Jubilee Catalogue is saving millions of dollars for the American people.

Is it saving Money for *You* and for your family? Are you taking *full advantage* of your opportunity?

Buy from this Book. Fill all your needs from this Book. Consult it daily to find the right price, the *lowest price* for dependable, reliable goods of standard quality.

If you have not a copy of this Catalogue—Fill in the coupon above and receive your copy FREE.

To write today for your free copy of this big Golden Jubilee Catalogue will mean a saving of many dollars to YOU this Fall.

It answers every question about price, establishes for you the right price to pay for everything you buy.

Fifty years' experience in manufacturing—in right buying—has gone into this book. Fifty years' experience in low price making is here at your service.

Write for this Catalogue. Know the right price to pay for everything you buy. Take advantage of the many big bargains it offers—the many, many things offered at less than market prices.

TO THE WOMAN: This free Catalogue offers you the newest styles, selected by our own Fashion Experts. And all the usual extra "style profit" has been eliminated from our prices.

It offers you everything for the home at a big saving: Rugs, Carpets, Curtains, Furniture, Home Furnishings of all kinds of standard quality at money saving prices.

TO THE MAN: Think of an all wool—virgin wool suit for less than $15.00. This is an example of our Golden Jubilee Bargains. Everything a man needs, to wear or to use, is offered at prices that mean many dollars saved.

FOR THE FARM: For fifty years the American Farmer and Montgomery Ward & Co. have helped each other. This book outdoes all our past achievement in making low prices for you.

Fencing, roofing, tools, paint, hardware — everything the farmer needs is offered at a saving.

# Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

### Form of Lease

Please send blank form of lease for farm on which livestock is one of principal products.—Subscriber, San Francisco.

The Cultivator is not equipped to print and does not handle blank forms of any kind. The most complete fund of information we know of as to leases or contracts is to be had in "The Farm Lease Contract" by L. C. Gray and Howard A. Turner, which may be had by writing Division of Publications, Department of Agriculture, Washington, D. C. The subject is perhaps even more fully discussed in "Farm Management," a text book for student, investigator, and investor by Prof. R. L. Adams, University of California. This book is published by McGraw-Hill Book Company, Inc., 370 Seventh Avenue, New York. Presume this book may be had in all California libraries or purchased of all book dealers.

### Nitrate of Soda for Nematodes

Some time ago I read an article written by Mr. Snowden on nematode extermination by applying nitrate of soda. I have an acre spot on my ranch infested with nematodes that I would like to clean up if possible. This is in a five year old nut grove in a corner where a sand streak runs through. If deep, clean cultivation and allowing one foot of surface soil to thoroughly dry out will help to kill the infestation I could do that in conncetion with any treatment you might suggest.—Subscriber, Covina.

We have from Dr. Snowden the following answer:

"I do not know as yet that nitrate of soda will eradicate nematodes as it is still in the experimental stage. However, since nitrate has in every instance made a very marked increase in the yield, I advise the inquirer to apply nitrate over the entire ground at the rate of 400 pounds to the acre. We do not know as yet whether fall or spring applications would be most effective. All our tests have been made in the early spring."

In addition to the above we may add:

We are just in receipt of Circular No. 77 sent out by the Georgia experiment station covering investigations being carried on for the control of root-knot nematode.

The result of these investigations and experiments seem to prove that soil treatment is not practical on account of the expense involved and further that it is necessary to use such strong chemicals to destroy the nematodes, that it prevents plant growth until the effect of the chemical has passed from the soil.

Steam sterilization is an effective means of eradication but the cost is prohibitive.

The starvation process means keeping the soil free from all susceptible host plants for a number of years.

A modification of the starvation method is recommended. This is the growing of non-host plants on the infested area and keeping the soil free from all other vegetation. Onions, peanuts, all varieties of climbing and bunch velvet beans and some varieties of cowpeas and soy beans have been found to be the most resistant to the nematode, also the cereals and grasses have shown no serious infestation.

Tests made with the different varieties of fruit trees give promise of finding certain root stocks that the nematode does not attack. Pits from an old seedling peach tree in Florida were planted in infested soil and proved to be entirely resistant after three years experiments.

The Marianna plum stock also proved to be resistant.

We hope that the continuation of these experiments will develop further resistant root stocks so that fruit growers in the United States will be spared the very heavy loss to which they are subject due to the work of this minute pest.

### Spotted Livers—Enlarged Livers

What would cause the livers of rabbits to be covered with white spots and in some cases be two or three times their natural size? Otherwise they seem to be healthy. Are fed mostly rolled barley and alfalfa hay with a little green feed when available, also plenty of fresh water. Pens are kept clean.—Subscriber, Tustin.

This trouble is caused by a parasite attaching itself to the liver. Would advise that stock so affected be not used for breeding. The feeding of carrots or dandelions is good in preventing the trouble. The stock can be eaten but spoils the sale to most people as they do not understand it and are afraid to eat it.—W. D. W.

### Ear Canker

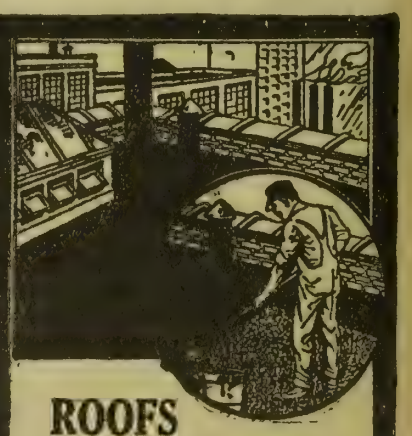
I have been bothered some this summer with sore ears in rabbits. Would appreciate a remedy.—Subscriber, Chico.

Take a small empty vaseline jar, fill with olive oil and add 1 teaspoon flowers of sulphur. Put a few drops in affected ear. Two applications generally are sufficient. Shake jar well before using.—W. D. W.

### Hutches—Care of Mother Rabbits

Please let me know the proper way to make hutches for mother rabbits, also the proper care of them. Have some mother rabbits that have had ten and more baby rabbits and seem not to care for them, and before a week they nearly all die.—Subscriber, Watsonville.

Hutches may be made in single tier or double tier with slat or solid floors. Each has its advocate, but generally speaking a hutch should not be deeper than a man's arm so stock can be easily secured when one desires to handle. This is about 24 inches deep, 3 to 4 feet long and 18 to 24 inches high, has double roof or is put under shade so hot sun can not heat roof.



**ROOFS CANNOT LEAK**

**if you apply a coating of**

**Stormtight**
FOR USE ON ANY ROOF IN ANY WEATHER

Apply Stormtight *over* your old roof and save the cost of tearing up the old roofing.

Stormtight is famous for long service without repairs or repainting. Heat or cold do not affect it.

Doors, nest boxes and utensils are arranged so one can work handily in caring for them. As to doe not caring for young it may be because she has not been properly fed before birth of young so as to be able to produce sufficient nurse for them. Your questions are of such general natural that it is impossible to answer fully in the space at our command in this department. There are books published covering the entire range of the rabbit industry and these are worthy of careful reading on the part of the beginner.—W. D. W.

### Eradicating Johnson Grass

Kindly let me know the best way to eradicate Johnson grass from land that is badly infested.—Subscriber, Glendale.

The most effective way of eradicating Johnson grass is to practice clean culture, either by keeping the ground clean of all vegetation or growing such crops as require considerable cultivation. If the land is badly infested it would be best to keep it clean and well cultivated one or two seasons. Cultivate often enough so that none of the grass ever gets more than two or three inches above the ground. This can best be done by plowing in the spring and as soon as the ground is well pulverized, go over it with a cultivator equipped with weed knives every two or three weeks or as often as the grass begins to show above the surface. If your land is such that it can be plowed when dry, good results will follow summer plowing provided rains or irrigation water do not interfere to prevent the drying out process. Continued pasturing with sheep or cattle will kill it out in time but the land must be overstocked so that the grass will be kept eaten down as close as possible. There are numerous chemicals that can be employed to eradicate Johnson grass, but most of them are either too expensive or too severe on the soil. In the Cultivator of June 4, 1921, page 738, a chemical eradicator for home manufacture is offered. There are also some of these being manufactured and offered for sale that are said to be effective.

## Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

### Loco Poisoning

I have four cows affected by eating cascara or coffee berries. They first begin to step a little high in the hind legs or act a little stiff then as they begin to get more berries they begin to stagger and get weak in the back. They usually run from three to six weeks before entirely losing the use of their hind legs. They seem to give way in the kidneys. I have tried epsom salts which was prescribed by a veterinarian but lost the cow. These have been affected about three weeks. What can I do for them?—Subscriber, Santa Ysabel.

The symptoms you describe are those caused from eating loco weed. Presume they have been getting them also. First they must be kept where they can not get the weeds because, it is said, that once the habit of eating them is acquired they seem to like them and will hunt them. Feed liberally on nourishing feed. Fresh cut alfalfa is about the best.

To cure the staggering gait we advise giving these powders. Four ounces of powdered gentian, two ounces of powdered nux vomica and enough corn meal to make a pound. Mix and divide into 32 powders and give each cow one powder morning and evening.

If the bowels are constipated give each cow a pint of raw linseed oil once a day or that amount of melted lard.

One of the principal things to do is to keep the bowels free. If you will write to the Agricultural Experiment Station, Berkeley, California, and ask for Bulletin No. 249 on "Stock Poisoning Plants" they will probably send you a copy which may be of help to you.

### Pigs Scouring

What makes small pigs scour when three days or a week old? The sows are not over fat and I do not feed them until 48 hours after farrowing. I generally feed ground barley and alfalfa meal lightly at first. How can I prevent it and how can I cure it if it should get started?—Subscriber, Live Oak.

It may be due to something the sows are eating or to a germ that is on the teats. I you could wash the udders with a good antiseptic just before the pigs come it might prevent the trouble. After the pigs come wash the udders once a day with a solution of permanganate of potash, using a teaspoon in a quart of water.

### Dropsy and Caked Udder

I have a cow that came fresh just a few days ago. The next day I noticed a swelling under the belly between the navel and the udder. The swelling kept getting larger until it extended to the front legs. The calf had the scours the second day but seems all right now. I have been feeding the cow dry alfalfa and a few water melon rinds for the past few months and she has been in the corral half the time. The udder is and has been caked since calving. What caused the caked bag and the swelling and what is the remedy?—Subscriber, El Monte.

The trouble seems to be a case of influenza coming at the time of calving. The influenza is past now but has left a quantity of refuse in the system that must be eliminated. Get one ounce of aloin, half an ounce of powdered nux vomica, four ounces of turpentine and enough raw linseed oil to make one quart. Mix all thoroughly and divide into two doses. Give the two doses 24 hours apart and the next day give a dose of salts. Take one pound of epsom salts and half a pound of common salt and dissolve in two quarts of hot water, when cool give it all at one dose. Feed her laxative food. Green alfalfa or corn fodder if you can get it. Rub the udder with the hands and milk it out clean at every milking.

# Herbicide Kills Weeds Cheaply, Effectively

**Satisfaction Guaranteed**

Destroys, absolutely, all pest weeds, noxious grasses, vines, shrubs, including Johnson, Bermuda, Morning Glory, Crab, Nut, Bronco, Water Grasses, Malva, Thistle, and all other noxious plants.

Herbicide is a triumph of modern science. It is a combination of chemicals, which, when sprayed on the foliage, permeates the entire sap system of the plant, and kills it root, branch, seeds and all. Inasmuch as the seeds, also, are killed, your next season's crop of weeds will be lighter and eventually you will banish them entirely.

Herbicide is extremely economical and easy to use. Does not require a professional sprayer. Far cheaper and more effective than hand labor with a hoe. To save freight we ship in concentrated form—one gallon makes ten gallons of spray. This is one of the reasons why Herbicide is a more economical spray to use.

Herbicide is tried, tested, proven. It cannot fail to remove noxious weeds in the cheapest and most effective manner known. Now is the time to kill them. Enrich your land by removing worthless weeds which sap the soil.

# A Chocolate Sauce that covers everything

Here is a little kitchen idea that many housewives are discovering for themselves: Instead of stopping in the middle of meal-making to prepare some chocolate sauce, why not have a jar or two [home-made] within arm's reach on the pantry shelf? The recipe at the right will take only ten minutes to make. And—you'll have a supply of chocolate sauce that will save you *hours!*

You know how a generous "spilling" of chocolate sauce will glorify a commonplace cup custard. And even a simple cornstarch pudding [or some cooked rice] topped off with this delicious sauce makes a fine, healthful dessert.

Since 1852 D. GHIRARDELLI CO. San Francisco

**How to make it:** Mix 1 cup sugar with 1 cup Ghirardelli's Ground Chocolate. Add ½ cup boiling water, ⅛ teaspoon salt, and cook 10 minutes or until thick. When cold add 1 teaspoon vanilla. Store in tightly covered jar. This makes 1 pint of chocolate sauce. Send for our recipe booklet.

### THE CHRONIC BORROWER

There are some people who borrow
Your coffee and sugar and rice;
In winter they borrow your fuel,
In summer they borrow your ice.
They borrow your bread and butter,
Your tinware and tools by the pack;
They borrow, borrow and borrow,
But never bring anything back.

There are some people who borrow;
They wear out your patience and smiles,
And often to ask for a favor
They travel a great many miles.
They ask your advice and ideas,
Till often your brain you must rack;
They borrow, borrow and borrow,
But never bring anything back.

There are some people who borrow
From brothers, from beast and from soil;
They count not the value of favors
Tho' lavished with tears and with toil.
They garner from friends and strangers
But justice and gratitude lack;
They borrow, borrow and borrow,
But never bring anything back.—Zula Lloyd-Leach.

### WHERE EVERYONE HAS A STAR

FARMING and agriculture have been carried on so long in Jugo-Slavia, the newly formed kingdom of the Serbs, Croats, and Slovenes, that what is practically a farming religion has developed, fostered by the people themselves and by their innate love of beauty.

Nearly 90 per cent of the inhabitants live on farms and most of them own their own farms. Millions of tons of wheat, barley, oats, maize and potatoes are harvested each year. It is the first country in the world in plum raising and the first in Europe in corn production. In 1919 Serbia alone produced 15,000 tons of tobacco and in 1920 the output of sugar was 35,000 tons.

In the whole territory, comprising an area as large as New York, New Jersey and Pennsylvania, there are few large cities and the farms and little villages are scattered far and wide. The people live so close to the soil that they have learned to love it as so many Americans love the city in which they live—intimately and practically. They have invested trees and rocks with personalities of their own. Beautiful maidens called "vile" inhabit the groves and water falls and superintend the planting of the seed and the reaping of the harvest. Occasionally the "vile" are partial to a particular family and then they are fortunate indeed for a "vile" is a far more effectual guard than life insurance. She watches the baby in the cradle and sees that the cows and sheep do not eat the wrong kind of grass or stray beyond the fold.

In addition to the "vile" are the "vale" who live in the clouds and regulate the wind and rain. The "vale" are generally too busy with celestial matters to take much trouble over the affairs of men. Fairies are nearly always on hand at the birth of a baby and if well treated they may grant the baby wishes for a happy future. It is safer to leave a little plate and cup for the fairy just after a baby is born lest she should be hungry and care to taste of mortal fare. When the baby is seven days old the fairy flies away never to return again. No one but the baby himself knows what fate she has left hanging over his cradle and of course he soon forgets.

Death holds no terrors for people who live so close to nature that they observe her wonderful phenomena in the daily activities of the crops and harvests. The Jugo-Slavian peasants believe quite literally that the sky is the floor of heaven and beyond this, once one has passed that bright blue barrier, are seven countries through which the soul must travel before it comes up before God.

On Easter day, so runs the old Slavonic legend, St. Peter is a little drowsy because he has drunk too freely of the Easter wine and he leaves open the gates between this world and the next. Thus anyone who dies on Easter day or any of the seven days afterwards need not linger in any of the seven regions—his soul goes straight through to Paradise.

Indeed the sky, perhaps because it touches the earth so closely in those peaceful Slavic regions, is almost as familiar to the peasant as the earth from which he gains his bread. He knows all the great silver roadways of the stars and has a name for every planet. Most of the stars have legends of their own and at night, in front of little straw thatched huts, the peasant father may be seen sitting peacefully smoking and telling his small son or daughter how God has sown the stars through the heavens so the angels may find their way at night!

Each tiny Jugo-Slavian has a star of his very own which, when he dies, is extinguished like a light. Indeed every one in the world has a star, according to the Slavic belief, that burns until he dies and when you see a falling star it is a soul on its way to paradise. During the great war the villagers tell how the heavens were full of falling stars, particularly on the evening of battle.

### HINTS FROM HOUSEKEEPERS

#### Hygienic Dessert Recipes

I have enjoyed so many of the good recipes on your page, and I have wondered if some of your readers would not be equally glad to have my hygienic dessert recipes. We use these largely in place of pie and cake, believing them as good and more healthful.

Bran and Peach Pudding. Lay on four slices whole wheat or bran bread one cup of dried stewed peaches (figs may be used instead) and pour over this 1½ pints milk, two eggs, ½ cup honey, one tablespoon of hot water, flavoring, and bake. The whites of the eggs may be saved for meringue.

Honey and Apple Custard. Peel and quarter four apples, bake with ½ cup honey, one cup water, a little lemon or orange peel until tender, then pour over them a plain boiled custard.

Honey Health Pudding. Bake 1 cup sterilized bran, 1 cup bread crumbs, 4 cups milk, ½ cup honey, ½ cup raisins (or shredded coconut, two eggs, and flavoring. Whites of eggs may be used for meringue.

Baked Fruits Dessert. Bake together 4 sliced apples, 1 cup raisins, 1 cup prunes, or figs, a little lemon peel, with ½ cup of honey and 2 cups boiling water poured over all.—Mrs. Della Mead, Huntington Park.

#### Another Cow Camp Song

Herewith you will find an old cow camp song composed, I am told, by Cow Boy Reader, address anywhere West of the Mississippi River. I am very much pleased with the songs you have printed.—Walter H. Langburg, Paradise.

### MONTANA

Take me back to old Montana
Where there is plenty room and air,
Where there are cottonwood and briar trees,
Bitter root and prickly pear.
Where there ain't no pomp nor glitter,
And a shilling's called a bit,
Where at night the magpies twitter,
Where the Indian fights were fit.

Take me where there is sage brush plenty,
Where ther's rattlesnakes and ticks,
Where a stack of wheats cost twenty
And they sell gilded bricks.
Take me where there hain't no subways
Nor forty story shacks
Where they shy at antomobiles
High plug hats and three-rail tracks.

And where the old Missouri River
And the muddy Yellowstone
Make green patches through the badlands
Where old Sittin' Bull was known.
Take me where there's diamond hitches,
Rope brands and ca'tridge belts
Where the boys wear chaps for britches,
Flannel shirts and Stetson felts.

Where the old sun tanned prospector
Dreams of wealth and pans his dirt,
Where the night hears sleepy punchers
Singing to steers and plying their quirts.
Take me back to old Montana
The land of copper, alfalfa and gold.
Take me back to old Montana
And let me die there when I'm old.

### HOUSEHOLD QUERIES

#### "Lasca"—" 'Os'ler Joe"

I would like very much to see in the Cultivator the poems "Lasca" and "'Os'ler Joe." Some have said " 'Os'ler Joe" was vulgar but I can't seem to find any vulgarity in it. I think it very pretty and have heard it recited several times in good company. I am a new subscriber and have enjoyed every

issue of your paper.—Subscriber, Glenn County.

"'Os'ler Joe" will be given in a later issue of the Cultivator. We reprint the poem "Lasca" as follows:

### LASCA

**By Frank Desprez**

I want free life, and I want fresh air;
And I sigh for the canter after the cattle,
The crack of the whips like shots in a battle,
The melley of horns and hoofs and heads
That wars and wrangles and scatters and spreads;
The green beneath and the blue above,
And dash and danger, and life and love.
And Lasca!

Lasca used to ride
On a mouse gray mustang close to my side,
With blue serape and bright belled spur;
I laughed with joy as I looked at her!
Little knew she of books or of creeds;
An Ave Maria sufficed her needs;
Little she cared save to be by my side,
To ride with me, and ever to ride,
From San Saba's shore to Lavaca's tide.

She was as wild as the breezes that blow;
From her little head to her little feet,
She was swayed in her suppleness to and fro
By each gust of passion; a sapling pine,
That grows on the edge of a Kansas bluff,
And war with the wind when the weather is rough,
Is like this Lasca, this love of mine.

She would hunger that I might eat,
Would take the bitter and leave me the sweet;
But once when I made her jealous for fun,
At something I'd whispered, or looked, or done,
One Sunday in San Antonio
To a glorious girl on the Alamo,
She drew from her garter a dear little dagger,
And—sting of a wasp!—it made me stagger!
An inch to the left, or an inch to the right,
And I shouldn't be maundering here tonight;
But she sobbed, and sobbing, so swiftly bound
Her torn reboso about the wound,
That I quite forgave her. Scratches don't count
In Texas, down by the Rio Grande.

Her eye was brown,—a deep, deep brown;
Her hair was darker than her eye;
And something in her smile and frown,
Curled crimson lip, and instep high,
Showed that there ran in each blue vein,
Mixed with the milder Aztec strain,
The vigorous vintage of Old Spain.
She was alive in every limb
With feeling to the finger tips;
And when the sun is like a fire,
And sky one shining, soft sapphire
One does not drink in little sips.

The air was heavy, the night was hot,
I sat by her side, and forgot—forgot;
Forgot the herd that were taking their rest,
Forgot that the air was close opprest,
That the Texas norther comes sudden and soon,
In the dead of night or the blaze of noon;
That, once let the herd at its breath take fright,
Nothing on earth can stop the flight;
And woe to the rider and woe to the steed,
Who falls in front of their mad stampede!

Was that thunder? I grasped the cord
Of my swift mustang without a word.
I sprang to the saddle, and she clung behind.
Away! on a hot chase down the wind!
But never was fox hunt half so hard,
And never was steed so little spared.
For we rode for our lives. You shall hear how we fared,
In Texas, down by the Rio Grande.

The mustang flew and we urged him on;
There was one chance left, and you have but one,—
Halt, jump to ground, and shoot your horse,
Crouch under his carcass, and take your chance;
And if the steers in their frantic course
Don't batter you both to pieces at once,
You may thank your star; if not, goodby
To the quickening kiss and the long drawn sigh,
And the open air and the open sky,
In Texas, down by the Rio Grande.

The cattle gained on us, and, just as I felt
For my old six-shooter behind in my belt,
Down came the mustang, and down came we.
Clinging together, and—what was the rest?
A body that spread itself on my breast,
Two arms that shielded my dizzy head,
Two lips that hard on my lips were prest;
Then came thunder in my ears,
As over us surged the sea of steers,
Blows that beat blood into my eyes,
And when I could rise—
Lasca was dead!

I gouged out a grave a few feet deep,
And there in Earth's arms I laid her to sleep;
And there she is lying, and no one knows;
And the summer shines, and the winter snows;
For many a day the flowers have spread
A pall of petals over her head;
And the little gray hawk hangs aloft in the air,
And the sly coyote trots here and there,
And the black snake glides and glitters and slides
Into a rift in a cottonwood tree;
And the buzzard sails on,
And comes and is gone,
Stately and still like a ship at sea.
And I wonder why I do not care
For the things that are, like the things that were.
Does half my heart lie buried there,
In Texas, down by the Rio Grande?

---

### "Curfew Must Not Ring Tonight"

Could you please publish the poem, "Curfew Must Not Ring Tonight," by Rose H. Thorpe?—Subscriber, Oroville.

### CURFEW MUST NOT RING TONIGHT

**By Rose H. Thorpe**

Slowly England's sun was setting o'er the hill-tops far away,
Filling all the land with beauty at the close of one sad day.
And the last rays kissed the forehead of a man and maiden fair,
He with footsteps slow and weary, she with sunny, floating hair;
He with bowed head, sad and thoughtful, she with lips all cold and white,
Struggling to keep back the murmur—"Curfew must not ring tonight."

"Sexton," Bessie's white lips faltered, pointing to the prison old,
With its turrets tall and gloomy, with its walls dark, damp, and cold,
"I've a lover in that prison, doomed this very night to die,
At the ringing of the curfew, and no earthly help is nigh;
Cromwell will not come till sunset," and her lips grew strangely white
As she breathed the husky whisper: "Curfew must not ring tonight."

"Bessie," calmly spoke the sexton, every word pierced her young heart
Like the piercing of an arrow, like a deadly, poisoned dart,
"Long, long years I've rung the curfew from that gloomy shadowed tower;
Every evening, just at sunset, it has told the twilight hour;
I have done my duty ever, tried to do it just and right,
Now I'm old I still must do it—Curfew must be rung tonight."

Wild her eyes and pale her features, stern and white her thoughtful brow,
And within her secret bosom Bessie made a solemn vow.
She had listened while the judges read without a tear or sigh,
"At the ringing of the curfew, Basil Underwood must die."
And her breath came fast and faster, and her eyes grew large and bright—
In an undertone she murmured—"Curfew must not ring tonight."

She with quick steps bounded forward, sprung within the old church door,
Left the old man threading slowly paths so oft he'd trod before;
Not one moment paused the maiden, but with eye and cheek aglow,
Mounted up the gloomy tower, where the bell swung to and fro;
And she climbed the dusty ladder on which fell no ray of light,
Up and up—her white lips saying,—"Curfew must not ring tonight."

She has reached the topmost ladder,, o'er her hangs the great, dark bell;
Awful is the gloom beneath her, like a pathway down to hell.
Lo, the ponderous tongue is swinging, 'tis the hour of curfew now,
And the sight has chilled her bosom, stopped her breath, and paled her brow.
Shall she let it ring? No, never! Flash her eyes with sudden light,
And she springs and grasps it firmly,—"Curfew shall not ring tonight."

Out she swung, far out, the city seemed a speck of light below,
'Twixt heaven and earth her form suspended, as the bell swung to and fro,—
And the sexton at the bell-rope, old and deaf, heard not the bell,
But he thought it still was ringing fair young Basil's funeral knell.
Still the maiden clung most firmly, and with trembling lips and white,
Said, to hush her heart's wild beating,—Curfew shall not ring tonight."

It was o'er, the bell ceased swaying, and the maiden stepped once more
Firmly on the dark old ladder, where for hundred years before
Human foot had not been planted. The brave deed that she had done
Should be told long ages after, as the rays of setting sun
Should illume the sky with beauty; aged sires with heads of white,
Long should tell the little children, Curfew did not ring that night.

O'er the distant hills came Cromwell; Bessie sees him, and her brow,
Full of hope and full of gladness, has no anxious traces now.
At his feet she tells her story, shows her hands all bruised and torn;
And her face so sweet and pleading, yet with sorrow pale and worn,
Touched his heart with sudden pity, lit his eye with misty light;
"Go, your lover lives," said Cromwell; "Curfew shall not ring tonight!"

Wide they flung the massive portal; led the prisoner forth to die,
All his bright young life before him. 'Neath the darkening English sky
Bessie comes with flying footsteps, eyes aglow with love-light sweet;
Kneeling on the turf beside him, lays his pardon at his feet.
In his brave, strong arms he clasped her, kissed the face upturned and white,
Whispered, "Darling, you have saved me,—Curfew will not ring tonight."

---

An old French proverb calls spinach "the broom of the stomach."

## Protect Your Precious Teeth

In stormy weather your family is protected by rubber clothes and boots to prevent colds and other diseases.

In good weather or bad, the enamel of your teeth (the protective outer covering) needs to be cared for against the constant attack of decay. Mothers and school teachers should see that the teeth are brushed at least twice a day with a safe dental cream, to remove food particles in which the harmful decay germs breed.

The U. S. Public Health Service says that a dental cream should not contain grit. Harsh grit in a dentifrice may damage the precious protective enamel. You can be sure of a *safe* and sensible, non-gritty, drugless dental cream, suitable for *all* the family, when you buy Colgate's Ribbon Dental Cream.

## COLGATE'S

### Cleans Teeth the Right Way

*"Washes"* and Polishes—
Doesn't Scratch or Scour

Colgate's contains a specially prepared fine chalk. It has no harsh grit, no strong drugs or chemicals. The refreshing, delicious flavor makes tooth brushing a pleasure.

More dentists recommend Colgate's Ribbon Dental Cream than any other dentifrice. Since 1806 Colgate has made reliable products which every farm family likes.

### FEED THE BEST STOCK ON THE FARM

What Kipling said of an army is almost as true of the folks behind the lines. Kipling said that an army travels on its stomach. We know now that, in peace or in war, in ranks or out, the "shortest way to a man's heart" is also the shortest way to public vigor, morale and efficiency.

The war proved, and it still is proving, that eating is not as simple a matter as we had thought. It proved that a people may get "enough to eat," as to bulk, and yet if there be lacking dairy products, green vegetables, and fruits, malnutrition will rack the vitality of the whole population. Worse, it will stunt the growth and twist the bodies of the children.

When this thing happens—as we know even now that it is happening in Russia and in the Balkans—the pity of it stirs us to send overseas whole armadas bearing gifts. We send what we know these foreign peoples lack—dairy and vegetable foods. That is the great need over there.

And that to a less degree, of course, but crucially enough in many cases, is the need over here. Not that we lack milk, vegetable foods, and fruits; we have all these foods in abundance. Only, we do not know how to use them.

This is as true in the country as it is in the city. Probably it is more true in the country. A garden is a lot of trouble in summer, and to put up fresh vegetables for winter is a thing too often crowded out by the business of feeding the hands and the husband, of keeping the house, the children, and the chickens in order.

Again, and particularly on dairy farms, the milk so often goes to make up an even five gallons or 50 gallons for shipment, rather than to make up a more evenly balanced ration for the most important livestock on the place—the family.

That is one reason why in rural schools all over the nation, as in city schools, at least a third of the youngsters are not as big and strong as they ought to be for their age, and why so simple a thing as a warm milk or vegetable and milk dish at noon almost invariably brings them up to normal weight in double-quick time. Milk and vegetables meet the dietetic lack of these youngsters just as truly as do the milk and vegetables on our gift ships meet the need of those children overseas.

"If cows, why not folks?" thought women of Milan Township, Erie County, who attended with their husbands the dairy feeding school last year, and heard what balanced rations will do for the hero.

They said they wanted to do some work on balanced rations in the home. Charline McClure, the county home demonstration agent, asked for the aid of Lelia Ogle, nutrition specialist, and the two of them drew up with 15 farm bureau women of the township a food study demonstration.

All except four of the 15 women came to the five meetings where each time a different aspect of family dietetics was threshed out. All agreed to try the system on their families for the period between February and April, when the first and last meetings were held and each arranged to pass the work on to at least one neighbor, lesson by lesson.

Now they have reported their results. Twelve of the 15 families have increased the use of milk, the average increase being above a gallon and a half a week, and this at a time of year when milk was scarce. Ten families increased the use of cooked cereals such as oatmeal; nine fried potatoes less often; all increased the use of vegetables other than potatoes; all increased the use of fruits; eight used less meat; and nine fried eggs fewer times.

All reduced the use of tea and coffee, and three families cut it out altogether. Eight cut down on their pie ration, and seven more are not serving pie at all.—Extension Service News.

### HEALTH FOR CHILDREN

By A. M. H.

The mother who is watchful for her child's best development never allows it to form the ugly habit of thumb sucking, and if the habit is taken in time, while it is still only a tendency, it can easily be corrected by the use of mitts, sold for the purpose or made at home. Also the awkward, disfiguring habit of biting the finger nails may be treated in the same way. The serious results of thumb sucking are enlargement of the tonsils, protruding teeth, flat thumbs, breathing through the open mouth at night and a decided susceptibility to cold.

If a child shows the least symptom of trouble in breathing, it should be taken to a competent physician and examined, and if adenoid growths are present, they should be removed or the child may become either deaf or permanently weak and delicate. For health's sake children should be trained into proper postures or they may grow up with an awkward bearing and become slouchy and stoop shouldered.

If mothers would add a pinch of table salt to the water in which young children are washed and then use boric powder, either by itself or mixed with lanoline, they would find it acts as a preventive for breaking out with heat and for eczema and hives. An excellent lotion to use is made by dissolving two tablespoons of the same powder in a quart of water, adding a teaspoon of starch, boiling all together and using when cold.

Every infant's mouth should be washed twice daily with a piece of clean sterilized linen dipped in borated glycerine, easily prepared by warming ten parts of glycerine, five parts by weight of boric powder, and this must be stirred until well dissolved. If a child's mouth is kept in a hygienic condition by the aid of this solution, he will be far less susceptible to infant diseases, and it is also good for cuts and bruises and for use in the ears, eyes or throat.

There is no point on which people are so careless as the care of their children's first teeth and there is no condition that tends in a greater degree to produce good health and vigorous growth of the body than a good sound set of teeth, and by giving the baby teeth proper attention you are insuring the permanent teeth a healthy growth.

### WORTH FIFTY POUNDS

A Sydney, Australia, paper recently published a Richmond River grower's "great idea." The grower said—"I got a dog and trained him to be savage. I turned him out in the vineyard at night. After one or two encounters with prowlers his fame spread, and we were pestered no more."

In reply to the suggestion that the dog might easily have been poisoned, the ex-orchardist smiled. "No," he said, "he couldn't take a bait. I muzzled him."

"But then he would be harmless."

"He would have been, only I fixed a sail needle on his muzzle with the point sticking out in front of him."

"Where did you get that idea?"

"In a little river town near my old vineyard. I saw the local wag muzzle a stray pup like that and let him go in the main street. In a few minutes the pup had become so used to the muzzle that he forgot it, and when another dog hove in sight the pup went up to him and tried to salute him in the usual way. Next thing you saw was the dog, with his tail well down, streaking for home, with a yelp at every stride.

"The pup would look astonished, and then wander off until he met another dog. In about half an hour he had driven all the dogs of the town into the bush, and he sat down and howled like a very lonely little pup.

"People who hadn't seen the fun would go up to find out what the poor little fellow was howling about. They'd stoop down to pat him, and next minute, with a yell, they'd be making for the chemist's for some iodine, while the pup followed and prodded their legs, wanting to be friendly.

"That's where I got my idea. It saved me 50 pounds a year, anyway."

### SOMETHING GOOD TO EAT

The time honored life sustainers known as ham and eggs still continue to occupy a prominent place in the list of foods known to possess marked nutritive values. The prominence of this dish so popularly known as "Ham an' " has had a tendency to obscure to some extent many of the palatable dishes prepared from ham and other ingredients besides eggs.

Of the many ways in which ham may be deliciously prepared there is one method of preparation to which the California department of agriculture calls attention which has not as yet been popularized apparently on account of limited familiarity with the following recipe: A slice of ham one inch or more thick, depending on the number of persons to be served. Remove rind and a part of the fat. Dredge well with flour, to which a sprinkling of pepper has been added. Place in a covered earthen or glass dish. Cover ham completely with sweet milk. Bake in a moderately heated oven from one to two hours. The longer and slower the baking process, the better the resulting dish. The flour and the small amount of fat left adhering to the lean, together with the milk, forms a most delicious gravy to serve with the ham. If you like ham try it once prepared accord-doubt you will want to repeat the enjoyment.

Some people have so much artistic temperament that they pose while winding the phonograph.

# Life Partners

THE union of Nature, Science and the Farmer is a partnership for life.

In the golden sheaves of living wheat, and in the waving, shimmering fields of barley, Nature stores the vital elements of human power and energy which Science converts into Grape-Nuts—the famous body-building food.

Grape-Nuts with milk or cream is a complete food, which contains all the nutrition (including the mineral elements) required for making rich, red blood, and for building sturdy body tissue, sound bone structure and strong, healthy nerve cells.

The 20-hour baking process makes Grape-Nuts easy to digest and develops that delicious, sweet flavor and crispness that has made this food a favorite the world over.

The Sievert Oil Burner burns either distillate or kerosene oil in cook stoves, heaters, furnaces, pasteurizers, boilers, prune dippers, dairy sterilizers, etc. Absolutely safe, odorless, very convenient and low priced. MAKES HEAT AT HALF WHAT WOOD AND COAL COSTS. Install it yourself. Write for circular and prices on different sizes. Address Sievert Oil Burner Co., 710 North Main St., Los Angeles.

## NEW BUREAU TO STRENGTHEN HOME ECONOMICS WORK

An announcement of unusual significance to both farm and city women was made recently by Secretary of Agriculture Wallace: "Ultimately I have in view making the home economics work an independent bureau," said Secretary Wallace in his preliminary announcement, "ranking with the other bureaus of the department, and placing at the head of it a woman of executive ability, thorough scientific training, and a broad and sympathetic understanding of what is needed to make such a bureau most helpful to the women of the country."

Work for women has grown steadily in the department of agriculture. In 1915, what has been called the office of home economics was created as a part of the extension service. In this home economics work a great deal of attention has been given to studies of foods and how best to use them, labor saving devices for the home studies of dressmaking and materials, etc. While work of this sort is planned primarily for the help of women on the farms, much of it is equally helpful to women in the cities, and especially to those in moderate circumstances who must exercise economy and get the greatest value for the money spent.

The woman chief of the proposed new bureau will rank with the chiefs of the other bureaus of the department of agriculture, attend the weekly conferences in the secretary's office and thus bring the women's viewpoint into the general work of the department.

## A VOICE FOR THE HOME-MAKERS

Any farm that can afford a silo can afford a bathroom and a septic tank sewage disposal system. Any farm that can afford a cream separator can afford a washing machine. Any farm that can support pumping and storage facilities for the livestock can afford running water, hot and cold, in the house. Any farm that can maintain a manure spreader can afford an electric lighting system. Any farm that can afford self-feeders for the cattle can afford vacuum cleaners and electric-saving devices for the women. Any farm that can justify binders, silage cutters, hayforks, pumping engines, shredders, side-delivery rakes, corn harvesters, potato planters, and finely equipped barns can afford every modern convenience for making the home a good place for woman to live, work, rear children, and develop in them the love for farm life.—Herbert Quick.

## BRING WATER INTO THE HOUSE

One of the most valuable assets for a farm is an ample supply of good water readily accessible. Such a water supply is a necessity for domestic purposes, and the location of the water with respect to the home is an important factor. Admittedly one of the first demands of health is a good, clean, pure water supply; but, however pure the water may be, it is not essential to woman's health that she be obliged to carry it from the well to the house.

## SPANISH RICE

1 cup rice, white or brown, 3 cups water, 2 cups tomato, 2 tablespoons butter, 3½ teaspoons salt, 2 onions (medium) grated or ground, 2 pimentos, cut fine. Put mixture on the stove and let come to a boil. When it boils, cover and set in the oven. Cook from 1½ to 2 hours in the fireless cooker. If cooked in open dish use 4 cups water

## HABITUATION

"Your constitutents must think very highly of you to send you to Washington again and again."

"Not all of them," admitted Senator Sorghum. "Many, of course, contemplate me as their invincible leader, but a few regard me merely as a sort of bad habit."—Selected.

A small kitchen handily arranged is more satisfactory to the housewife than a large one with all the latest equipment. Steps saved are hours gained.

## BIRDS AID SNAIL CLEAN UP AT LA JOLLA

An interesting account of two species of birds feeding upon the snail, Helix pisana, at La Jolla, has been reported to the state department of agriculture by County Horticultural Commissioner R. R. McLean. He says: "In connection with the survey of infested areas and subsequent clean up of the European snail, Helix pisana, at La Jolla, it is interesting to note that two birds have been noted as feeding on this mollusk.

The infested territory was burned over about 3 years ago and at that time enormous numbers of snails were killed, a very strong odor of burning flesh being apparent. Immediately thereafter flocks of seagulls came in and feasted on the "roasted snails." Outside of the burned area many live snails were in evidence on low bushes and shrubs, but gulls were not observed to feed on them.

Another infestation of this snail at La Jolla has occurred and in making a survey of the district last week with A. J. Basinger of the bureau of pest control of the state department of agriculture, a male English sparrow was noted to be busily engaged in feeding on young live snails clustered on a small dead Monterey cypress tree. At this stage the shells are soft and easily broken.

The English sparrow, long regarded as an undesirable immigrant, has scored a point if it is an enemy of this destructive snail.

## LOS ANGELES COUNTY FAIR

Agricultural and horticultural exhibits will have a large place at the Los Angeles County Fair to be held at Pomona, October 17-21. Besides many individual displays there have been entries from numerous towns that will send examples of their finest produce through their respective chambers of commerce. As Pomona is a central point in an exceedingly rich rural community it has a vast territory upon which to draw. It is expected that the agricultural exhibits will be complete, interesting and of genuine educational value.

Farmers will be enabled to obtain much information that will prove invaluable to them in crop raising. Demonstrations of improved farm machinery, tractors and tested appliances will be featured.

In the livestock section full lists of fine animals are promised in each department, and the cups, cash prizes and other trophies offered have encouraged early entries in large numbers. Many of the prize winners from the state fair at Sacramento will be shown at Pomona, including two full herds from the Fred Hartsook ranch at Lankershim. The pure bred Holsteins that will come from the California Junior Republic will be a perfect example of project teaching and will interest teachers, students and farmers alike. This particular herd, the result of careful breeding by boy students, is remarkable as proof that a fine herd of purebreds can be developed from a modest beginning. The goat show, sponsored by the Citrus Belt Milk Goat Association, will be another interesting display, and much will be made of the poultry department under the supervision of Paul E. Kennedy.

Electric —— Dish Washer!

—another Servant for Country Homes

AFTER THE HEAT and heavy work of summer, you will especially appreciate the labor- and time-saving advantages of an Electric Dish Washer. Besides its convenience and practical utility, an Electric Dish Washer is much cleaner and more sanitary than the old methods of doing dishes and drying with towels which become wet and soiled. It costs no more to operate than the burning of the 100 watt lamp in your front room.

An Electric Ironer, Vacuum Cleaner and Sewing Machine would also help to lighten your work and give you a chance to rest up.

The next time you are in town, CALL ON A DEALER WHO HANDLES THESE ELECTRICAL APPLIANCES. Get full information regarding cost of operation, etc.

# THE A.R.O. SALE

## 37 REGISTERED HOLSTEINS 37

**Carl Ray's Raynora Ranch, Lankershim, Calif.**

**Thursday, September 28, at 10 A.M.**

If you want well bred young registered Holstein cows, with unusual size, high average type, of splendid breeding and nearly all with large official records, attend this sale—sure.

**This Is a Complete Dispersal of Mr. Ray's Milking Herd, Every Registered Holstein Cow of Milking Age in His Herd Will Positively Sell to the Highest Bidder. He Retains Only His Heifers Under Milking Age**

The largest percentage of cows with official records ever offered in a Western sale will sell in this offering. Of the 37 females selling, two are heifers under milking age, and of the remaining 35 there are 33 with official records, mostly from 20 to over 32 lbs. butter in 7 days.

**There Are Five Splendid Cows in This Sale With Official Records Above 30 Lbs. Butter In 7 Days, and a Number of Others With 29, 28, 27, and 26 Pound Records**

Every animal is positively guaranteed to be a breeder; every animal tuberculin tested and sold subject to retest by the buyer.

TERMS OF SALE—California Breeders Sales and Pedigree Co. will extend credit on the basis of one-third cash, balance in three, six, and nine months, to responsible parties who arrange for credit before sale.

PLACE OF SALE—Mr. Ray's Ranch, just at the city limits of Lankershim.

## COMPLETE DISPERSAL

# DIAMOND BAR HEREFORDS

**Diamond Bar Ranch, Spadra, Calif. Tuesday, September 26, at 1 p.m.**

**45—Registered Herefords—45**

**19 Females—26 Bulls**

This complete dispersal of well selected Herefords will afford buyers an opportunity to secure breeding females of substanial worth, and an unusually good selection of bulls for range service.

THE FEMALES

The 19 females include eight cows with calves at foot. Not a female in the sale over six years old. They are practically all sired by Beau Tempter, Bourbon Columbus, and Prince Carlos 10th. A real opportunity to buy good females in a year when few are offered for sale in this state.

THE BULLS

The 26 bulls are an attractively bred lot of individuals, all ready for heavy service. They include sons of such famous bulls as Beau Blanchard, Don Perfect, Prince Carlos, Cuba's Panama, Beau Lamplighter, Grove Dale, Beau Mischief 40th, and Donald Lad 15th.

These cattle are range raised, used to rustling for themselves, and will be presented in good breeding condition.

GUARANTEED BREEDERS—TUBERCULIN TESTED

TERMS OF SALE—California Breeders Sales and Pedigree Co. will extend terms of one half cash, balance in six months, to responsible parties who arrange for such credit before sale.

DIAMOND BAR RANCH is at Spadra, Los Angeles County, on the Valley Boulevard between Puente and Pomona.

## STATE FAIR AWARDS

We gave last week the beef and dairy cattle awards at the state fair. The swine and other awards are given below.

### Poland Chinas

The Poland China show at the California state fair was perhaps one of the greatest shows that has been held in California. Quality was in evidence, and in some classes there were large entries. Marked improvement in type made it fairly easy for the judge to line up the classes in a satisfactory manner.

Probably one of the strongest classes in the Poland China show was the junior yearling sow class. The aged boar class was beyond doubt one of the strongest aged boar classes ever shown in this state. Navy Boy, grand champion last year as a senior yearling, was the first prize aged boar, and won senior and grand champion honors. An entry from Johnson Brothers, of San Diego, stood second in the aged boar class. Bassett A. Buckland and Sons, of Fresno, were fourth. There was but one entry in the senior yearling class, and this was won by the Tagus Ranch of Tulare.

The junior yearling boar class was a strong class. Westerner C, an entry from Straloch Farms, headed the class, followed closely by a deep-sided smooth boar shown by A. Buckland & Sons. Fred D. Grant of Fresno exhibited the third prize junior yearling boar. Gatewood and Stevens were fourth. The senior boar pig class was not up to standard, the judge having considerable trouble finding a boar to top the class. He finally placed an entry from Buckland's herd at the top of the class. In the junior boar pig class there were many strong-legged, rugged boars. The first prize was a well balanced pig with considerable size and stretch, exhibited by A. Buckland & Son. A Johnson entry and an entry from the Tagus Ranch followed closely, and another entry from Buckland was fourth. This was a good class of good type, strong, rugged boar pigs.

The aged sow class was headed by last year's grand champion, shown by Bassett Brothers. She is a strong-boned sow, deep of side and in excellent condition. She has raised two litters during the year, and was shown in excellent bloom. The senior yearling class was headed by an entry from the Tagus Ranch. Bassett Brothers exhibited the second and third prize sows.

The junior yearling class was won by a sow exhibited by the Tagus Ranch. She was shown as a junior pig last year by P. B. Long, a beginner in the business. She is a strong-boned sow, carrying an exceptionally strong back, and is smooth throughout. The sow was later made senior champion and grand champion of the show. The second prize sow was shown by Straloch Farms. She is out of Liberty Girl 3d, grand champion sow two years ago, and was an exceptionally strong entry.

Bassett Brothers of Hanford stood first, second and third on senior sow pigs. These gilts were well grown, smooth, deep sided, strong legged gilts. They made an excellent show. In the junior sow pig class, Bassett Brothers was first and fourth. A. Buckland & Sons, Fresno, were second and third. The gilt at the head of the class was a well grown, smooth, strong gilt.

The aged herd won by Straloch Farms, was headed by the junior yearling boar, Westerner C. Bassett Brothers were second and the Tagus Ranch was third. In the herds under a year, Bassett Brothers was first and second, and Johnson Brothers, third. —E. H. Hughes.

Exhibitors: Bassett Brothers, Hanford; A. Buckland & Son, Fresno; Mrs. A. C. Buckland, Fresno; Eugene Buerkle, Bakersfield; California Polytechnic School, San Luis Obispo; Chas. E. Dack, Fresno; Fred Gatewood, Fresno; Helen Gatewood, Fresno; Gatewood & Stephens, Fresno; Johnnie Glusing, Winton; Fred D. Grant, Jr., Fresno; L. B. Hughson, Ahwahnee; C. E. Johnson, Turlock; Johnson Brothers, San Diego; Kern County Union High School, Bakersfield; Kern County Union High School Agricultural Club, Bakersfield; Sheldon Morley, Bakersfield; Vivian Morley, Bakersfield; P. E. Mitchell, Atwater; Straloch Farm, Davis; Tagus Ranch, Tulare; Bob Watts, Bakersfield.

The awards follow:

Aged boar—1, Gatewood & Stephens on Navy Boy. 2, Johnson Bros. on Renowned Liberator. 3, Bassett Bros. on Western Rainbow. 4, Buckland on Giant Prospect. 5, Kern County High School on The Kern County Pilot.

Senior yearling—1, Tagus on Fresno Boy Jr.

Junior yearling—1, Straloch Farm on Westerner C. 2, Buckland on The Tempest. 3, Grant on Grant's Peter Pan. 4, Stevens on Steve's Long Boy. 5, California Polytechnic School on Westerner B.

Senior pig—1, Buckland on Commander. 2, Bassett Bros. on Rainbow's Designer. 3, Gatewood on Sailor Boy. 4, Straloch Farm on Yankee Bob. 5, Buckland on Giant Challenger.

Junior pig—1, Buckland on Model Jones. 2, Johnson Bros. on The Wave. 3, Tagus on No. 348, Unnamed. 4, Buckland on Jones Model. 5, Tagus on Tulare Boy.

Aged sow—1, Bassett Bros. on Hazel C. 2, Buckland on Evergreen Hutch. 3, Tagus on Miss Big Price. 4, Johnson Bros. on Model May.

Sow, senior yearling—1, Tagus on Willows Lady. 2, Bassett Bros. on Lady Comet. 3, Bassett Bros. on Smooth Giantess. 4, California Polytechnic School on Pacheco Bobbie. 5, Morley on Bakersfield Lady.

Junior yearling—1, Tagus on Sunkist Maid. 2, Straloch on Liberty Girl-A. 3, Bassett Bros. on Imp's Giantess. 4, Buckland on Miss King Kole. 5, Straloch on Liberty Girl B.

Senior pig—1, Bassett Bros. on Lady Designer. 2, Bassett Bros. on Princess Rainbow. 3, Bassett Bros. on Princess Designer. 4, Straloch on Straloch Queen A. 5, Buckland on Show Girl.

Junior pig—1, Bassett Bros. on Nifty Girl. 2, Buckland on Maid's Model. 3, Buckland on Model Maid 1st. 4, Bassett Bros. on Bonnie Belle. 5, Tagus on Elliott's Kind.

Senior and grand champion boar—Gatewood & Stephens on Navy Boy.

Junior champion boar—Buckland on Model Jones.

Senior and grand champion sow—Tagus on Sunkist Maid.

Junior champion sow—Bassett Bros. on Nifty Girl.

Aged herd—1, Straloch Farm. 2, Bassett Bros. 3, Tagus Ranch.

Young herd—1, Bassett Bros. 2, Buckland. 3, Johnson Bros.

Exhibitors herd—1, Bassett Bros. 2, Johnson Bros. 3, Buckland.

Get of sire—1, Straloch Farms get of Frisco Boy. 2, Bassett Bros. get of Prince Designer. 3, Buckland get of King Kole.

Produce of dam—1, Straloch Farms produce of Liberty Girl 3. 2, Straloch Farm produce of Black Beauty C. 3, Buckland produce of Model Maid.

Pen of barrows—1, Straloch Farms. 2, Tagus Ranch. 3, Fred Grant.

Single barrow—1, Straloch Farms. 2, Tagus Ranch. 3, Straloch Farms.

### Duroc-Jersey

In the Duroc-Jersey show, Charles LeMoyne of Lankershim made an excellent showing with his aged stuff. A. D. Long of Davis, Dolcini of Davis, Western Laboratories of Stockton, J. E. Thorp of Lockeford, were in the money in most cases. The aged boar class was won by LeMoyne on an exceptionally good type, strong topped boar, lacking a little in smoothness of side. He was followed by Dolcini's boar, Choice Wonder 3d, who was grand champion as a junior yearling two years ago. The senior yearling class was won by an entry from the Thorp herd, and the junior yearling class was won by the Western Laboratories on a boar that placed last year as a junior pig. The senior boar pig shown by Charles LeMoyne was followed by a boar from the Dolcini herd, and A. D. Long was third on a well grown pig that lacked a little in class. The judge seemed to have trouble in finding the top in the junior pig class. A growthy, strong-boned pig from the Thorp herd finally headed the class, followed by an entry from the LeMoyne herd. There were other pigs in the class that will no doubt grow out and be good boars.

The aged sow class was an exceptionally strong class. The class was finally won by Pathfinder's High Lady, exhibited by LeMoyne, who also exhibited the second prize sow that carried an exceptionally deep side, lacking a little in quality and finish. Thorp won the senior yearling class with a gilt that was junior champion last year. This sow stood on plenty of bone and was strong of top. The junior yearling class was won by Le Moyne on a sow that was exceptionally smooth, deep of side, and was finally made grand champion of the show. The senior pig class was won by an entry from the Long herd, a gilt that had been well grown out and was shown in excellent flesh. The junior pig class was also won by Mr. Long. The aged herd went to Le Moyne; Thorp was second and Dolcini third. The young herd was won by Dolcini, Long was second, and Dolcini third.

The get of sire was won by Mr. Long and the produce of sow was won by Mr. Dolcini. The grand champion boar was won by Mr. LeMoyne, and the reserve grand champion was won by Dolcini. Both these boars were aged boars of merit. The grand champion boar carried a little more scale, although lacked a little of the smoothness of the Dolcini boar. The junior yearling sow, Sensation Ellen, was the grand champion sow. She is an exceedingly deep sided sow, with plenty of scale, type and finish. Mr. LeMoyne exhibited the junior champion boar and Mr. Long exhibited the junior champion sow. The reserve grand champion female was the first prize senior yearling sow exhibited by J. E. Thorp. She is a strong topped, good sided, heavy boned sow.

Considerable interest was manifested in the Duroc-Jersey show.—E. H. Hughes.

Exhibitors: Charles J. Moyne, Lankershim; V. F. Dolcini, Davis; Pacific States Corp., Tulare; Lowell J. Beever, Fresno; J. E. Thorp, Lockeford; J. C. Craig, Owensmouth; Clarence Scott Estate, Winters; Western Laboratories, Stockton; H. P. Slocum and Son, Willows; California Polytechnic School, San Luis Obispo; Mr. and Mrs. A. D. Long, Davis; Harvey M. Berglund, Dixon.

The awards follow:

Boar two year old—1, Moyne on Model Defender's Sensation. 2, Dolcini on Choice Wonder 3rd. 3, Pacific States on Winsor's Chief. 4, Beaver on Falfadale's Sensation. 5, Thorp on Prince You'll Do.

Senior yearling boar—1, Thorp on Kings Sensation. 2, Craig on Prince of Pathfinder. 3, Scott Est. on Defenders Perfect Sensation.

Junior yearling boar—1, Western Laboratories on Sensation Bankroll. 2, Thorp on Diamond Bar Sensation. 3, Slocum on Key of Sensation. 4, Polytechnic on June Acres Pathfinder 2nd. 5, Craig on Junior Boy.

Senior pig boar—1, Moyne on My Young Partner. 2, Dolcini on June Acres Mahaska Wonder 2nd. 3, Long on A. & G.'s Sensation Wonder 2nd. 4, Dolcini on June Acres Mahaska Wonder 3rd. 5, Craig on Western Sensation Leader.

Senior pig boar—1, Thorp on Jumbo of Mossdale. 2, Beaver on Duyer's Longfellow Sensation. 3, Slocum & Son on Unnamed. 4, Slocum & Son on Unnamed. 5, Berglund on Orion Defender Lad.

Two year old sow—1, Moyne on Pathfinder's High Lady. 2, Moyne on Lady Pathfinder. 3, Thorp on Wonder Sensation Girl. 4, Moyne on Col. Pathfinder's Lady. 5, Craig on May Rose Tattletale.

Senior yearling sow—1, Thorp on Diamond Sensation Lady. 2, Laboratories on June Acres Wonder Lady 2nd. 3, Laboratories on Lucy Sensation. 4, Thorp on Queen of Diamonds. 5, Dolcini on June Acres Wonder Lady 29th.

Junior yearling sow—1, Moyne on Sensation Ellen. 2, Moyne on Sensation Annie. 3, Slocum on Keys of Beauty Giantess. 4, Slocum on Keys Model. 5, Dolcini on Miss June Acres Pathfinder.

Senior pig sow—1, Long on A. and G.'s Sensation Girl. 2, Laboratories on No. 145. 3, Moyne on Col. Pathfinder's Lucy. 4, Laboratories on No. 144. 5, Moyne on Col. Pathfinder's Queen.

Junior pig sow—1, Long on A. and G.'s Sensation Lady. 2, Dolcini on June Acres Pathfinder Lady. 3, Long on A. and G.'s Sensation Lady 1st. 4, Moyne on Primrose Model 3rd. 5, Laboratories on No. 162.

Senior champion boar—1, Moyne on Model Defenders Sensation. Reserve, Dolcini on Choice Wonder 3rd.

Junior champion boar—1, Moyne on My Young Partner. Reserve, Thorp on Jumbo of Mossdale.

Senior champion sow—Moyne on Sensation Ellen. Reserve, Thorp on Diamand Sensation Lady.

Junior champion sow—Long on A. and G.'s Sensation Girl. Reserve, Long on A. and G.'s Sensation Lady.

Aged herd—1, Moyne. 2, Craig,. 3, Dolcini.

Young herd—1, Dolcini. 2, Long. 3, Thorp.

Get of sire—1, Dolcini. 2, Long on get of Choice Wonder 3rd. 3, Dolcini.

Produce of sow—1 and 3, Dolcini. 2, Long on Produce of Butte of Sensation Girl.

Pen of barrows—1 and 3, Western Laboratories. 2, Long.

### Berkshires

Perhaps the outstanding feature of the Berkshire show was the fact that last year's grand champion sow, Violets Festline, shown by the Italian Vineyard Co. of Guasti, came back again this year and repeated her performance while her senior yearling daughter, Festline's Rival 3rd, was made reserve grand champion sow. Their remarkable smoothness combined with size, mellowness and unmistakable evidence of their value as breeding animals, won for them the favor of the judge and the ringside talent.

The junior champion female was found in Guasti's Royal Lady, bred and owned by the Italian Vineyard Co.

The boar classes as a whole were hardly up to the standard of last year, but Escalon Big Joe, shown by A. B. Humphrey of Escalon, carried his 900 pounds with ease and was a favorite for grand championship honors. He was an unusually mellow fellow, with deep, smooth sides, and the best of legs and feet. Guasti's Rival, the junior yearling shown by the Italian Vineyard Co., was a young boar of much promise and made a very acceptable reserve grand champion.

A. B. Humphrey showed the junior champion, Grapewild Ambition, a promising senior yearling.

In the barrow classes the Italian Vineyard Co. presented for consideration one of the smoothest barrows shown at the state fair in years, easily winning his breed class. He later won the grand championship in the open class in competition with the other breds.

While the Berkshire show was smaller in numbers than that of previous years, the quality of exhibits reflected credit on the efforts of California breeders to keep pace with other sections of the country in the improvement of this popular breed.

Exhibitors: Italian Vineyard Co., Guasti; A. B. Humphrey, Escalon; C. T. Johns, Ontario.

The awards follow:

Aged boar—1, Humphrey on Escalon Big Joe. 2, Italian Vineyard on Enhancer. 3, Johns on Master Type.

Senior yearling—1, Johns on Riverby Rival 2d. 2, Humphrey on Escalon Artful Leader 5. 3, Italian Vineyard on Iowana Artful King.

*Made to order for the* **Farmer's Car**

Practical experience with country roads produced this Goodrich 55.

Rugged, long lasting, built in both 30x3½ and 30 x 3 sizes, it is *made-to-order* for Fords, Chevrolets, Willys-Overland, and other cars using these sizes.

Tractorlike tread to grip any ground, and hold steadfast to the road against slipping and skidding.

Fortified tread and sidewalls to withstand the "bite" of deep ruts.

Made in one high quality only—the Goodrich Standard!

And its price is down—the lowest of low-tide prices.

Look this tire over at your nearest Goodrich Dealer, and you'll see sure return of service for every cent in its price.

(Grand champion pen barrows, all breeds) Straloch Farms (Polands).

**Hampshire Hogs**

The wonderful herd of Hampshires brought out by the Underhill Ranch at Santa Barbara had little competition in the herd shown by Hayes & Harter from Grants Pass, Oregon. Underhill's hogs are the result of years of study and intensive breeding on the part of the owner and while they are not yet the type he hopes to develop they are a wonderful improvement over the good herd he assembled as a foundation on which to work.

The Underhill herd was first in all classes but one in which it showed. Hayes & Harter defeated it in produce of sow. Carl Meiner of Ojai was first in senior yearling boar and the Oregon men took four places in senior sow pig and two in senior boar pig in which there was no competition.

All the championships went to the Santa Barbara herd.

**High School Judging Contest**

Esparto Union High provided the winning team in the judging contest for high schools at the state fair. The schools from north of the Tehachapi were the only ones entered as the southern schools will contest at the Southern California fair and the winning teams will meet at Davis during stockman's week. Competition was keen and only a few points separated the first seven teams. Classes of hogs, beef and dairy cattle, draft horses and sheep were scored. Ornburn Gray of Esparto was awarded the C. C. A. cup for highest scoring individual judge.

The contest was under the direction of Professors True, Hughes, Thomson, Howell, Miller and Wilson of the university farm assisted by various students and herdsmen of that institution.

The awards are:

1, Esparto Union, 1195; 2, Salinas, 1136; 3, Santa Cruz, 1125; 4, Colusa, 1106; 5, Modesto, 1106; 6, Lodi Union, 1100; 7, California Polytechnic, 1093; 8, Sebastopol, 1083; 9, Petaluma, 1082; 10, Bakersfield, 1069; 11, Watsonville, 1067; 12, Santa Roa, 1063; 13, Oroville, 1025; 14, Woodland, 1018; 15, Oakland, 970; 16, Princeton, 938; 17, Concord, 821; 18, San Juan, 720.

**Cattlemen's Association High School Cup**

For best individual judge:

1, Ornburn Gray, Esparto Union, 423; 2, Mervyn Burke, Salinas, 420; 3, Albert Vance, Esparto Union, 406; 4, Edwin Koster, Modesto, 402; 5, Bailey Fairchild, Lodi Union, 402; 6, Jack Hammond, California Polytechnic, 402.

## CALF CLUB SHOW

Intense interest on the part of the juvenile farmers centered in the calf club contest which was provided especially for them. After showing in the club show many of the animals went into the open classes against the mature breeders and made fame for themselves. Most of the calves were chosen as well as fitted and shown by the boys and girls and there is no question that California is to have a crop of top notch breeders when these youngsters are grown.

KING KORNDYKE PONTIAC MEAD

Backed by Producing and Transmitting Dams. HIS Dam, De Kol of Valley Mead 2nd, and HIS Sire's Dam, Miss Valley Mead De Kol Walker, have made a total of FIVE RECORDS—Averaging 1038 lbs. Butter in 7 days. For HIS SONS from A. R. O. Dams, write or see us:

Championships, Holsteins—Kern Rag Apple De Kol, bull; Pearl Aagie Hengerveld Segis, heifer.

## STATE FAIR MILK AND CREAM CONTEST

Just as the livestock men want their individual animals to win so do the commercial diarymen strive to attain high honors in their exhibits of milk and cream. Samples are taken with the greatest care and sent to Sacramento where they are examined by specialists and graded on flavor and odor and general cleanliness.

There is nothing exciting about an exhibit of milk and yet it is wonderfully interesting to compare the different score cards so as to tell whether your milk man is preparing a product which is considered good enough to win against the dairies of the state. This is a contest which should be encouraged.

Certified Milk—1, Adohr Stock Farm, Van Nuys, 98.8; 2, Hollow Hill Farm, Redlands 98.2; 3, Sleepy Hollow Ranch, San Anselmo, 97.1.

## PORK DAY AT FRESNO

Fresno County is going to put on a big day on October 20 when peaches, raisins and all the other well known crops of the county will be laid aside and the lowly hog will be given his just praise.

There will be competition between farm bureau centers, individual raisers and boys and girls. The prize money runs into big figures in the open classes and the breed associations are offering a nice lot of special prizes for barrows of their own breeds. The officers of the swine growers department of the Fresno County farm bureau will be in charge of the big celebration which will be held at Kearney Park.

---

It pays a farmer to give his tractor the same care that his wife gives her sewing machine. Lubrication helps a lot.

---

"By guess and by golly" plowing probably causes more poor crops than any other farm operation.

---

Says Sam: Some teamsters make me wish horses weren't so patient.

**Stop Hatching Weak Chicks**

**With Cheap Incubators**

It's a shame to waste your time and eggs hatching weak, wobbly chicks in cheap incubators, when everyone knows that

# The Prevention of Blackhead

By Jean A. Koethen

FOR a good many years blackhead has seemed to be the one obstacle in the turkey grower's road to fortune. Sometimes it is called by one name, sometimes by another, but always the symptoms are the same: lassitude, diarrhea, want of appetite, ending almost always in speedy death. A post mortem always reveals yellowish spots on the liver and intestines.

The course of the disease differs somewhat in different ages of birds. In poults under two weeks of age it is very rapid. You notice a little diarrhea today and tomorrow morning the poult is dead. Poults two months old will often droop for a week before they give up the struggle. The older the bird the greater its resistance to the disease and the longer does its illness last. What is the nature of this disease which attacks a flock without warning and frequently carries off half or even all its members?

### Caused by Parasite

According to Dr. Philip Hadley of the Rhode Island station, infectious entero-hepatitis, or blackhead, is caused by "a minute parasite belonging to the lowest group of animal life, the protozoa, and called a coccidium." There has been some dispute among the doctors in more recent years as to just what is the proper name of this coccidium, and Dr. Hadley in a bulletin published in 1920 declares it is not an amoeba, as he had at first thought, but a trichinomas. These names mean nothing to us, nor is the exact source of the disease of great importance. Whether these coccidia are permanent residents of the intestinal tract in all turkeys and are only excited to injurious activity by indigestion or are introduced into the intestines by infection, presumably from the droppings of other birds, the result is just the same. The bird droops and dies.

Dr. Hadley (Bulletin 141) describes three courses which the disease may follow; the first, which carries off the very young birds, being similar to white diarrhea, the second, a "slowly progressive" form in birds above three weeks of age, the third, a chronic form, lasting in the older birds a year or more.

It is not necessary here to describe the symptoms more minutely. When young turkeys droop and die the trouble may safely be diagnosed as blackhead.

### To Cure Blackhead

Cures have been suggested at various times, but none has been tested out sufficiently to make it certain that we may put our trust in it. The ipecac treatment announced last year by the Doctors Harry and Paul Wegeforth of San Diego may prove to be the remedy experts have been searching for, but so far as I know only a few turkey people have made any attempt to try it out. The treatment consists in separating the sick birds from the flock and giving them 10 drops of fluid extract of ipecac three times a day, continuing this dosage for three days, then decreasing to 10 drops twice a day for three days, then to the same dose once a day for three days.

A Fresno breeder announces this treatment; Cut slices of bread in strips an inch long, soak in apple vinegar, and put 4 pieces down the turkey's throat. Repeat in 12 hours, or if the bird is very ill, in six. I have no idea what this man's reason is for using vinegar, and merely mention the treatment as something worth trying when the case seems hopeless.

### An Ounce of Prevention

The fact is, in this case as in most others, prevention is the thing. Once the disease appears its cure is very doubtful.

The Doctors Wegeforth claim that the use of powdered ipecac will prevent blackhead. A teaspoon is mixed in the food twice a week for each unit of 20 turkeys. This treatment in a flock of 38 young turkeys in 1921 was so successful that not a single bird showed signs of blackhead.

Another blackhead preventive, which was sent to this column by a subscriber last year may be repeated here: To a pint of bran and a pint of bread crumbs add enough boiling water to make a crumbly mash. Let this cool till it is only slightly warm and add 1 quart chopped greens, 1 small chopped onion and 1 cup chick grit or sand. For each 10 turkeys add three drops turpentine and one-quarter teaspoon ginger. This is fed twice a week in place of the regular mash and twice a day for 3 days if white spots (a symptom of approaching disease) are noticed on the back of the legs.

### Sour Milk

Sour milk and cottage cheese have long been the chief dependence of the turkey grower, not only for prevention of blackhead but for symmetrical and rapid growth. It is not always a preventive of this insidious disease but is so wholesome and so well liked by the birds that few growers care to try to do without it. It is considered an important part of the ration at the Rhode Island station, and its function seems to be not so much medicinal as sanitive. It keeps the intestinal tract healthy and helps to maintain complete and normal digestion. If this is done we may snap our fingers at the amoeba and trichinoma, for they cannot multiply under such conditions.

Another feed which is considered absolutely essential by most growers is onions. Blackhead attacks the liver, and onions are supposed to keep the liver functioning properly. They are a part of every meal for the first two months on most ranches. In extension bulletin No. 2 in which he describes the Rhode Island station method of feeding Dr. Hadley mentions onions only as one of many greens which may be used. Possibly their only use is as green feed. At any rate it does no harm and may do good.

Grit should always be a part of the ration of the little turkey—keeping it before them is not sufficient, for they are not fond of it. Mix it in the food so that they are obliged to eat it.

### Keep Them Hungry

More important than onions or sour milk or ipecac is the one rule which cannot be too frequently emphasized: "Keep them hungry." Overfeeding is the one great and overwhelming cause of the inflamed condition of the digestive tract which permits the development of the blackhead parasite. If little turkeys are allowed to gorge and stuff their crops at every meal their end is certain. Chickens by long domestication have become inured to heavy feeding and may be allowed to eat with impunity. Turkeys are still too recently from their wild state, and the wild bird does not gorge, at least when it is small. It walks out with its mother, picking a little here and a little there, a bit of sand, a bite of leaf, a tender fly. Our feeding of them must follow the natural system, "little and often," at first, "little and not often" after they begin to pick up their own food.

There is no certain rule besides this. I have found it a great help to watch their crops and remove the food as soon as the crop begins to feel hard. If one bird is slower than the others it is placed in the bowl and allowed to finish its meal. Miss Kate Warner, pioneer turkey grower of Hemet, follows this same plan. Time feeding cannot be depended on because some birds eat so much more rapidly than others. Watch the crops, and never, never, let them have all they want. They should still be eager for more when the food is removed.

### Chilling

Just what part chilling plays in the development of the backhead parasite has not been determined, but there seems to be no question that it is an element not to be despised nor overlooked. The first week of its life the little turkey is more easily chilled than a chick, and when it is chilled digestion stops, diarrhea begins, and death follows speedily. Little turkeys should be kept indoors when the weather is foggy or rainy, never allowed out in the morning till the dew is off the grass, and protected in every possible way from cold and dampness. One has only to watch a brood of poults and notice how differently they look and act on warm and on cold foggy

days to realize how much warmth has to do with their comfort. None of the experts mentions warmth as a factor in the development of the blackhead parasite, but every experienced turkey grower I have talked with realizes its importance. Some brood artificially, some with chicken hens, some with turkey hens; some believe in overhead heat, some in underfoot heat. But all agree that the chilly poult has a very short lease of life.

# Poultry Queries

(Conducted by Jean A. Koethen)

### Wild Turkeys

"Out of 17 poults hatched June 8," Mrs. S. M. Lindesmith of Arroyo Grande, says, "I have not lost one. Whether it just happened so or not I cannot say, but I do know it has never happened to any other flock I have raised."

### Roup

My chickens have a discharge from the nostril and a slight swelling just in front of the eyes, which, when lanced discloses pus or a cheesy formation. Sometimes the eye is affected and seems to slough off in layers of canker. There is no odor. We are on new ground and have tried to be careful.—Subscriber, San Gabriel.

This is a good description of swellhead, one of the severest forms of roup. It is caused in the majority of cases by some error in housing. Are the chickens crowded on the roosts at night? Has the house any other ventilation than that which comes through the wire in front? Winter epidemics of roup are sometimes caused by dampness in house or yard, or by exposure to high or cold or damp winds. A summer epidemic of roup can hardly have any other cause than overcrowding, lack of ventilation or filthy conditions in houses and yards, and the cause must be removed before you can hope to permanently get rid of the disease. To treat, open all abscesses and wash out with peroxide of hydrogen, or warm boric acid solution. Then syringe mouth and nostril with the following mixture: Extract witch hazel, 4 tablespoons; liquid carbolic acid, 3 drops; water, 2 tablespoons, squeezing the bulb 5 times for each nostril and twice for the mouth. To cleanse the eyes use the boric solution, half a teaspoon of boric acid to a cup of warm water. Solution and spray should be used twice a day. Another treatment for mouth and nasal cavities is peroxide of hydrogen diluted 1 to 3 with water. Do not use peroxide on the eyes.

### Paralyzed

Occasionally one of my chickens is apparently paralyzed in the legs and never recovers but eats eagerly and lingers for weeks.—Subscriber, San Gabriel.

It is difficult to diagnose such a case without more particulars. Sometimes chickens afflicted with rheumatism sit around as if they were paralyzed, but genuine paralysis is almost always due to some distrubance in the intestinal tract—it may be worms, it may be severe indigestion, and it may be the result of eating spoiled or moldy food or mineral poisons. Epsom salts given in a little moist mash once a day for several days, one-half teaspoon for each bird, an increase in the amount of green feed, and a ration made more bulky by the addition of bran to the mash, are the remedies indicated.

### Purple Combs

Will you please discuss purple combs?—Subscriber, Imperial.

The purple comb is characteristic of the later stages of enteritis (dysentery) and the earlier stages of liver trouble, but is often seen in other diseases, especially where there is considerable fever, or inflammation. Sometimes the combs of heavy birds are turned dark by exposure to the sun in very hot weather. The term "enteritis" includes intestinal disturbance caused by any kind of poisoning. In all such cases, unless death comes very suddenly, the comb ultimately turns dark. When a good many purple combs are noticed in a flock without symptoms of illness, clogging of the liver by heavy feeding is the probable cause, and the ration should be made more bulky by the addition of bran to the mash and by the use of unlimited green feed. Chopped onions now and then are also valuable, and dandelion leaves are excellent for the liver.

### Liver Trouble

My chickens stand around rather droopy for a day or two and then die. They have free range, plenty of green feed, and rice. The liver of one I killed was very green.—Subscriber, Glenn.

Your chickens have liver trouble from improper feeding. Rice can only be used safely in small quantities and mixed with other grain. If you will keep a dry commercial mash before them, and give a good feeding of grain—preferably wheat, barley and cracked corn—at night, with the greens they get on range you will soon see improvement. It might be a good plan to give Epsom salts twice a week for a couple of weeks. Mix one-half teaspoon of salts for each bird in moist mash and feed just what they will clean up in a few minutes.

### Sick Turkeys

My turkeys, five and six months old, get droopy, their heads become spotted, their droppings yellow, and they die in a few days. I was told this is liver trouble.—Subscriber, Oxnard.

As nearly all turkeys that die a natural death die from blackhead it is safe to suspect blackhead in this case, though it is comparatively rare in turkeys over three months old. The only way to be sure is to perform a post mortem on the next one that dies. If you find the liver spotted with white or yellowish patches and the caecum or blind pouches swollen and inflamed you may be quite sure that the bird died of blackhead. In turkeys of this age the disease would naturally be of longer duration, and it may be they have been gradually losing weight for some time. Dr. Hadley in Bulletin 141 A of the Rhode Island Station says: "In adult birds the evidence for the presence of blackhead is presumptive if there is a loss of appetite, a stupor or languor, voluntary isolation from the flock, and a progressive emaciation." If, in addition to these symptoms, there is a diarrhea one may be almost certain. Of course, bad feeding is always likely to produce diarrhea, and it does not much matter whether or not the blackhead parasite is present. The main thing is to correct the feeding. Nine times out of ten overfeeding is to blame for the death of young turkeys and medicine is of little value. If your birds are on alfalfa, as all turkeys ought to be, they need very little beside. A handful of wheat or barley at night for each bird and a pan of sour milk before them when it is available, makes a very good ration. Turkeys that have not alfalfa range should have all possible green feed, chopped onions occasionally and a ration of bran and barley or bran and wheat.

### To Fatten Turkeys

I have mislaid the copy of the Cultivator in which you gave directions for fattening turkeys for market. Will you kindly repeat them. My turkeys are doing wonderfully on whole barley and alfalfa. I had good luck feeding young turkeys nothing at all; let them eat alfalfa and grasshoppers.—Subscriber, Caruthers.

Every young turkey ought to be on alfalfa for at least a part of every day. Losses are inevitable when they are deprived of their natural food and environment. Fattening for market should not begin before October. Whole or rolled barley may be kept before the birds in hoppers after the third month. About October 1 begin giving cracked corn in addition to the barley, and gradually work them onto whole corn. By the first of November let them have both corn and barley constantly before them. Some feeders add a mash of bran and corn meal once a day moistened with sour milk, and some depend on the whole grain. Turkeys cannot be fattened as rapidly as chickens can. They must take their time.

### Roup in Turkeys

It looks as if I would lose half my flock of turkeys with roup, and I can find no cure. Is it true that roup is more prevalent away from the coast than near it? Last year near the coast I had no trouble at all with this disease. This year in this high dry valley both I and my neighbors are much troubled.—Subscriber, Hemet.

I have had no experience in interior valleys but from the number of turkeys raised in Hemet, Antelope and Victor Valleys I feel sure the season rather than the location must be to blame. Are you letting your birds roost in the open? An open shed is all the protection they need in the coldest, wettest weather, and young stock in summer should roost under the sky. If roup is so general in your neighborhood it may be because your stock is all related and all has roupy ancestry. Turkeys that roost in the open will not have roup unless the tendency is inherited. The simplest treatment for roup is the potassium permanganate treatment. Drop a few

Peaches: Market steady. Locals and Northern, freestone and cling, all varieties, 3@4 lb.

Pears: Demand good, market steady. Northern: Bartletts, mostly 4@5; locals, 4@4½.

Plums: Demand and movement slow, market steady. Per lb.: Locals 2@4; Northerns: Various varieties 3@4 lb.

Watermelons: Local Klondike, best, 75@1.00; poorer, low as 50 .

### HONEY

Honey flow in Southern California curtailed after orange flow by drouth. Crop alfalfa honey light due to damage to crop in Northern section by adverse weather conditions and to reduction of acreage in Southern California. Demand and movement moderate, market steady. Carloads f. o. b. usual terms per pound. Extracted, White Orange mostly, 9½ cents; White Sage, 8@8½; Light Amber Sage, 6½@7; Light Amber Alfalfa, 4¼@6½. Comb: Buyers reported offering $2 70 per case for carlots f. o. b. Inyo County points ,but no large sales reported.

### HAY

Following are prices in the general market to growers f. o. b. Los Angeles in carload lots; handling and commission must be added to obtain retail prices on new hay:

Prices quoted f. o. b. L. A. to producers:

| | |
|---|---|
| Tame Oat | 20.00@22.00 |
| Barley Hay | 16.00@18.00 |
| Rabbit Alfalfa | 24.00@26.00 |
| No. 1 Dairy | 22.00@24.00 |
| Standard Alfalfa | 16.00@18.00 |
| Wheat Straw | 8.00@10.00 |
| Barley Straw | 7.00@ 9.00 |

### GRAIN

California Farm Bureau Marketing Exchange reports:

Wheat is strong and advancing somewhat. Eastern firmness makes stronger the California farmers position; still we are above the average level of United States markets, and continued advances in Chicago would be necessary to maintain even our present level of California prices. At present demand is good for better grades at from $1.80 to $1.90 Los Angeles.

Barley is locally strong, best quality selling at $1.32½; poor grades hard to sell, $1.20 to $1.25 being the going range. Good No. 1 feed will bring $1.27½. There is an inclination on part of farmers to hold back shipments, although the country contains much barley and not much export business so far.

The Farm Bureau Exchange writes under date of September 16:

Here is an accomplishment on the part of the California Farm Bureau Exchange. It is a clear demonstration of what can be accomplished through hearty cooperation and united action. After considerable effort succeeded in getting the Chevalier Barley growers of Monterey County to sign up their grain in such a manner as to permit sale exclusively through the California Farm Bureau Exchange.

The major portion of this barley was to be handled under the pool plan, some growers, however, preferred not to select the pool plan on account of their financial situation, and therefore turned their grain over to the exchange on the consignment plan, with the understanding, however,, that the exchange would handle it. Fully 90 per cent of the growers accepted this idea. The crop this season is possibly one of the largest on record. The quality is excellent, in view of the fact that the crop was large, grain buyers, as well as milling interests resorted to every imaginable method of trying to keep the pool from going through. These lots they were able to purchase at prices averaging from $1.25 to $1.45 per cwt. f. o. b. cars, shipping point.

We now have to report that we made a large sale today, for shipment to London and Hull, England, at a price equal to $1.96 per cwt. f. o. b. boat San Francisco Bay, which is equal to approximately $1.71¼ per cwt. f. o. b. shipping point.

In other words, the grain which the commercial interests termed as being "a burden on the market and something which should be selling at from $1.25 to $1.45 f. o. b. cars," has been sold by the farmers direct through their own organization at prices averaging from $5.00 to $9.00 per ton greater than these commercial interests were willing to pay.

Blackberries: Dr., 15@30.

Cantaloupes: Turlock Standard, 75@1.00; Honeydew and Casabas, flats, 50@1.00; Persian Melons, 75@1.25 cr.

Figs: Black, 75@1.00, double layer box; Calimyrna, 60@75 per crate.

Grapes: Thompson seedless, 75@1.00 per lug; large, 1.00@1.25; Malaga, Tokay and Muscat, 1.00@1.50 per crate; do, lug. 1.25@1.50; Rose of Peru and Isabella, 1.25@1.50 per cr.; wine grapes per ton, Zinfandels, $95@100; Malagas and Muscats, $45@50.

Huckelberries: lb. 20@25.

Peaches: 50@1.00 per basket; 90@1.25 per crate; 1.00@1.50 per Los Angeles lug; do large, 1.00@1.50 per lug; cling, 1.75@2.25 per large lug.

Pears: Bartlett, $1.75@2 per box; No. 2, $1.00@1.50.

Cal. Pear Growers prices to canners ton: No. 1 Bartlett, 75; No. 2, $40.

Plums: Best, $1.00@1.25 cr., 1.00@1.25 lug.

Raspberries: Dr., 50@55.

Strawberries: Local, dr., 45@55.

Watermelons: ¾@1 per lb. and less.

### HAY AND FEEDSTUFF

A. W. Scott Co. says under date of September 9:

Receipts of hay for the past week 1477 as compared with 1177 of the previous week.

The local market has been weak and the arrivals very heavy toward the end of the week and dealers making strenuous efforts to break the congestion. Export and coast shipments have been more active namely being forced in an effort to move accumulated stocks. Transportation has been easier and has aided in the general movement.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the market in San Francisco (for prices to consumers, charges of switching, cartage, commission and handling expenses must be added according to conditions.)

## Citrus Markets

Los Angeles, Sept. 20, 1922.

Only about 20 to 50 cars of oranges are being shipped daily. Limited offerings are commanding exceptionally long prices.

The hot weather has given a boost to the lemon market and everything in sight is being cleaned up.

**Citrus Shipments**

Shipments of citrus fruits to date since November 1, 1921. Southern California:

# New Lamp Burns 94% Air

## Beats Electric or Gas

A new oil lamp that gives an amazingly brilliant, soft, white light, even better than gas or electricity, has been tested by the U. S. Government and 35 leading universities and found to be superior to 10 ordinary oil lamps. It burns without odor, smoke or noise—no pumping up, is simple, clean, safe. Burns 94% air and 6% common kerosene (coal-oil).

The inventor, W. V. Johnson, 31 N. Fifth St., Portland, Ore., is offering to send a a lamp on 10 days' FREE trial, or even to give one FREE to the first user in each locality who will help him introduce it. Write him today for full particulars. Also ask him to explain how you can get the agency, and without experience or money make $250 to $500 per month.

## Snappy Notes on Livestock

**Any error herein is unintentional and subject to correction the following week. This summary is assembled from the best sources obtainable, and both producers and packers can assist by reporting actual sales or buys, giving names, dates and facts, and we will, if requested, withhold names. All we want is fact and a fair deal and correct information for the producers. Address A. L. Spellmeyer, care California Cultivator, 317 Central Avenue, Los Angeles. The Cultivator reaches over 40,000 producing farmers and livestock men.**

Government livestock reorts have started, and quotations approximate for Los Angeles 8 cents high to 6 low for steers and cows 4 to 6.75 with swine around the 200 pound mark 10 to 11, and lambs 12 to 13.

Carcass lists are around the 13.50 top steer mark, 12 cow mark 18 pork and 27 cents lambs.

Association lamb reports show 10.50 Yolo County up to 12.25. Some Nevada lamb feeders sold at 9 to 10 from association reports and information brings me details of 8 cents Nevada feeder lamb sales in the Winnemucca district.

Veal calves seem to be 7 to 8 everywhere, Arizona, Denver or Los Angeles. Feeder steers seem to be running around a 6 cent average in Colorado.

The Midland Texas yearlings are reported sold at $32.50 per head and the C. C. C. cattle of Arizona reported sold at $32 per head. Various lots of Northern Arizona yearlings sold at $25 per head. The Reid Cashien twos feeders are reported sold at 5 cents per pound and buyer had a chance to turn at 5.50 from rumors, 6.50 is the price f. o. b. Hackberry reported for the Duncan contract bought by Hauser, fat twos up from some 2000 steers.

All of the above is the optimistic run of fact, and as I am putting out a fact bulletin, and giving it straight, no matter who it displeases, I have another side to present.

The carcass lists on cows are cut heavily. I know of ten cent cow beef sales and of 11 cent sales and I hear some poor cow beef is being cut to the 8 cent mark.

The district around Kingman, Arizona, had a wonderful year and cattle are very good. Buyers cooled their heels around Holbrook and Flagstaff etc. and got very little rushed. I am told 15 of them are now bidding and going it strong, as in days of cattle prosperity. The same thing has happened evidently in another part of Arizona and at least one district in Texas. It may be prophetic.

However at the identical time and near where the $32 yearling Arizona steers sold to go to Colorado, 2000 long age twos of equal bone and size have been offered at $35 per head. Thousands of good New Mexico steers are still unsold at the $25 for ones, $35 for twos and $45 for 3s, and that isn't all the story.

I know of bunches of both thin and fat cattle for sale in New Mexico and Arizona priced so entirely different from the optimistic line up, that I wonder what is the matter with these "hotel buyers" that they warm chairs.

Good cows can be bought now, not thin, but called fat and which are in good shape at $30 per head. Other cows at $25 and some lots of thin cows and cows with calves at prices that no buyer should hesitate at. Some of the short grass districts where it is dry are offering good mixed Hereford-Durham cows, thin but in shipping condition, from 6 to 10 years old, at prices that approximate $20 per head and these are considering the $32 yearling steer prices almost gift buys.

The crime of it is for cows to be sold so cheap as to glut the market. Again it is a crime economically for these breeding cows to go to the shambles at all. In the inevitable cattle comeback the cow is the animal of them all that will double and triple in value.--A. L. Spellmeyer.

### HOLSTEIN ANNUAL READY

"Within the past 15 years California developed her first 30 pound cow. Today she is credited with over 7 per cent of all such cows of the breed."

"Less than 15 years ago the first cow to make 1000 pounds butter in California was developed. Now we have around 60 such cows to our credit or more than 10 per cent of the total of the breed." These quotations are from the mass of information about Holsteins in California and elsewhere which has been gathered together by Charles L. Hughes, secretary of the California Holstein-Friesian Association, and published in a very pretentious annual report. Together with the figures set down in the various tables and reports showing the producers, sales, records for production, state champions, etc., are many photographs of the champion show animals and each of the 1000 pound cows which has been developed in California. As Mr. Hughes says in his foreword, "This booklet is arranged in such a way as to make some of the most essential facts and figures easily available for reference to the busy breeder and student of Holstein affairs."

The book is a mine of information concerning Holstein cattle and should be in the hands of everyone interested in the breed. Copies may be obtained by writing to the California Holstein Friesian Association, Ochsner Building, Sacramento.

### MILK AND CREAM CONTEST

(Continued from Page 322)

Goat Milk, Raw—1, Mrs. L. P. Lommel, Napa, 92.8; 2, Richards & Wagner, Montara, 92.6; 3, F. Busboom, Los Angeles, 92.45.

### WINNERS IN STATE FAIR BUTTER FAT PRODUCTION

Mature Cows—Ava Model Hengerveld 2d, Fred Hartsook, milk 248.2, fat 7.427; Leonard Farm Erma, W. J. Hackett, milk 148.3, fat 6.836; Lady Cornucopia Mercedes, Fred Hartsook, milk 195.4, fat 6.827; Bylaria 2nd, Berylwood Stock Farm, milk 164.4, fat 6.506.

2½ to 4 Years—Leda De Kol Ormsby Hartog, Berylwood Stock Farm, milk 112.2, fat 6.492; Wadnah Ormsby Skylark, Fred Hartsook, milk 135.3, fat 6.233; Foxy Lass of Orland, W. E. Gurnett, milk 105.9, fat 5.868; Sarcastic Dulcing Jewel, Fred Hartsook, milk 163.0, fat 5.557.

Under 2½ Years: Fox's Sunshine Betty, Marguerite Conant, milk 85.1, fat 4.997; Lilly McKinley Ormsby, Fred Hartsook, milk 142.1, fat 4.551; Pearl of Willowood 3d, Charley Krause, milk 90.4, fat 4.470; Leonard Farm Agnes, W. J. Hackett, milk 93.3, fat 4.427.

### STUDENTS JUDGING CONTEST

In the judging contest for college students for the cup offered by the California Cultivator R. A. Malmstein was first with a score of 651 points. He had taken fourth place in dairy cattle with 139 points, first in sheep with 138 points, second in swine with 132 points, first in horses with 142 and fifth in beef cattle with 110 points. The total of his points was 60 more than that of his nearest competitor. The contestants with their score are:

R. A. Malmstein, first and cup winner with score of 651; G. H. DuBuisson, 591, 2d; W. D. Auerbach, 591, 3rd; F. R. Wilson, 590, 4th; J. E. Warne, 573, 5th.

Sheep Judging—Prize, a share of stock in American Shropshire Registry Association, won by Ralph Malmstein, 289 West Dormitory, Davis.

### POULTRY QUERIES

(Continued from Page 325.)

crystals in a quart measure or lard pail of warmish water, and dip the head of the affected bird in it, holding it under while you count ten. If there are abscesses under the eyes they should be opened and washed out with peroxide of hydrogen before the head is dipped. Repeat the dipping morning and night, always preparing the solution fresh, for it loses its strength when exposed to the air. Another treatment recommended by Dr. Sanborn consists in spraying nostrils and other mucous surfaces with this mixture: Extract of witch hazel, 4 tablespoons; liquid carbolic acid, 3 drops; water, 2 tablespoons. He applies the spray twice a day, squeezing the syringe bulb five times for each nostril and twice for the mouth.

### WEATHER REPORT

San Francisco, Cal., Sept. 16, 1922

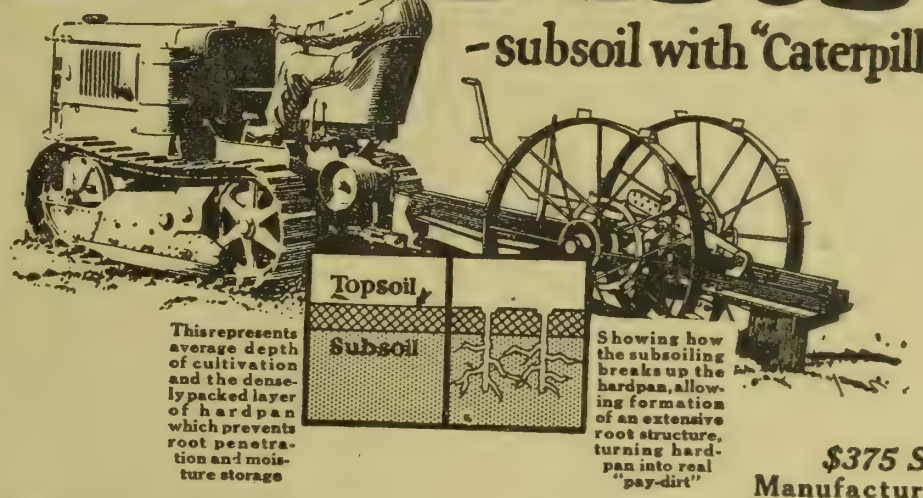
Unlock that vein of

"PAY DIRT"

-subsoil with "Caterpillar" power



This represents average depth of cultivation and the densely packed layer of hardpan which prevents root penetration and moisture storage

Showing how the subsoiling breaks up the hardpan, allowing formation of an extensive root structure, turning hardpan into real "pay-dirt"

UNLOCK the rich treasures of your subsoil—the real "pay dirt" on your farm. Give the roots more room to grow; give the moisture greater storage space. Subsoiling with "Caterpillar" power is the way. One man writes: "30% increase in grape crop first year of subsoiling". Another says: "A short time after subsoiling my orange trees showed more new growth than preceding 2 years." Many other letters tell of bigger profits from subsoiling.

"Caterpillar" T35 Tractor is the one tractor small enough for all orchard and vineyard work and yet powerful enough to handle the heavy job of subsoiling. It is only 48 inches wide and 52 inches high but delivers 15 horsepower at the drawbar.

The versatility, economy and dependability of "Caterpillar" T35 Tractor are axioms among its many owners. Other sizes of "Caterpillar" Tractors—5-Ton, Western 10-Ton and the big "75" meet other, bigger power needs. Write at once for information about "Caterpillar" Tractors and subsoiling tools.

*$375 Saving*

Manufacturing economies resulting from increased production have made possible a recent reduction of $375 in the price of "Caterpillar" T35 —the Supreme Small Tractor

*How "Caterpillar" T35 Handles Subsoiling*

"I subsoiled 65 acres of vineyard and 30 acres of pasture 16 to 18 inches with my "Caterpillar" T35 and had wonderful success. It does all you claim."
*Oliver S. Neuman, Woodbridge.*

"I pulled a new subsoiler so easily with the T35 that I had to instruct my man to use the soft pedal to avoid breaking the subsoiler."

90 EGGS AND THE HEN IS JUST PAYING HER "KEEP"
120 EGGS AND THE HEN IS JUST PAYING A PROFIT—

but why stop with

AUTHORITIES estimate it takes 90 eggs a year to cover the "keep" of a commercial hen—and 120 eggs to make just a profit. But—there's the rub! How are you going to get the extra eggs—the eggs that make the big bank-book difference between just a *profit* and a *just* profit?

The average hen under natural range conditions will produce only about 75 eggs a year. Yet *proper feeding and care* have developed commercial flocks that average 120 to 150 eggs a year per hen. Some flocks will range even higher.

It's all a matter of feed and care. The feed must be clean, tasty, varied. The elements of an egg are derived from many sources. Therefore, the greater the variety of feed ingredients the better. SURELAY contains a dozen tested ingredients balanced and blended according to the famous Sperry formula. It is made so good, so uniform, so tasty, that every time Mrs. Hen takes a peck at it she is eating something that goes into the making of an egg.

You know that Nature provides each hen with a certain number of embryonic ova. These are minute yolks which, under ordinary conditions, will take the hen a number of years to produce. But that isn't very profitable. So it is your job as a poultryman to secure the most eggs in the least time—and keep the hen in *good health* all the while.

SURELAY will give every hen in your flock an opportunity to pay not only her board bill but pay *you* a profit. This prime quality feed calls the "egg-making department" to order—makes it produce—and keeps the hen in "fine fettle" all the time.

Ask your dealer for Sperry SURELAY in the yellow-striped bag; and send for "Makes Hens Happy"—a practical guide to more eggs and more money. Simply clip the coupon and mail today.

### OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If among the more than 40,000 Cultivator's weekly circulation any fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

### EDITORIALETTES

Apricots are sometimes more or less demanding in their exactions as to soil and climate. It is to be noted that the state's great commercial production of this wonderful fruit is confined to little more than a dozen widely separated localities. One of these sections is in Riverside County up against the foothills, perhaps a score of miles east of the city of Riverside. The little city where the drying and canning is done is known as Hemet. The best of proof as to its fitness as a grower of the luscious apricot is given on the cover of this issue. The apricot is king in Hemet.

* * *

Regarding that scene on the cover we have from the Hemet Valley Chamber of Commerce the following: "The picture is one taken of a Tilton apricot orchard on the ranch of S. C. Miller, near Hemet, and producing this season 44 tons, 237 pounds of apricots from 188 trees. These trees were set out six years ago last March, 24 feet apart each way."

* * *

Pitt River is celebrating a great event on Saturday of this week. The waters have been harnessed and the first demonstration of the power of Pitt River's white coal when once brought into harness is to be given at that time. California has made all too small use of the water power going to waste. More, it has allowed all too much waste in irrigation possibilities. More attention is given to it today than ever before, and we hope before another year still greater advance will be made in conservation of power and irrigation water.

* * *

Reports given in the columns of the Cultivator of boys and girls judging contests, but more particularly regarding calf and pig club exhibits at the various fairs, remind us of a question we saw in an Eastern farm paper the other day. The question was: "Who owns the calf?" The article proceeded to discuss the value of training the youngsters through raising their own calves on the farm and then called attention to the old time habit of Dad—when the animal was ready for market he did as did his own father and his father before him, drove the calf to market and forgot to recompense the real owner. We know that the fathers of today are vastly different, yet there is occasionally one who sticks to the old-time idea that all the boy or girl earns until after majority belongs to the parent. Encourage real business education on the part of the youngsters, and the best way to encourage that is through actual transactions with their own property.

* * *

To the end that the education may be as complete as possible it is also fair to the youngsters that they realize it costs money to buy feed or to maintain pasture. It is very probable that looseness in this particular gives the youngster a false idea as to the real business training required to meet the problems which confront the farmer. Charge them up with the feed and they will be keener on the job of securing every ounce of nutrition from it. They will then be in a position to understand the old saying: "Scrub stock will eat anything; even money."

* * *

Texas appreciates the need for more trees. Her agricultural college has issued Bulletin 293, "Cultivation and Care of Trees on Texas Farms." The bulletin touches on care of both orchard and forest trees but gives more particular attention to timber, shade and windbreak trees than to deciduous fruits. The bulletin especially urges that the planter give attention to the woodlot after the planting rather than to follow the usual custom of allowing the tree to shift for itself once its roots have been placed in the soil.

### SAFETY FIRST

Last week's article with the above title called attention to daily loss of life from traffic accidents in one city of this state. It has brought comment from one subscriber who has dug into figures and found that "3,000 automobiles were struck at grade crossings in this country this year. In these accidents over 2,000 men, women and children were killed and over 3,000 others seriously injured. In literally dozens of instances whole families were wiped out of existence."

Let us be more careful.

### MORE TRUCKS

We suppose that truck drivers as well as railroad men may go on strikes, but there surely is less liability of a complete tie-up of traffic where trucks are available. Without question their use will increase in spite of the campaign to discourage it. Truck drivers themselves have been responsible for some of the opposition to trucks on public highways. Overloaded trucks driven at high speed materially injure and shorten the life of the best of paved highways. With reasonableness on the part of drivers and reasonableness on the part of law makers we believe proper methods of loading and driving will be developed and the usefulness of the truck extended.

### SAVING AN INDUSTRY

State and federal forces are thoroughly organized and ready to meet the situation created by the coming of the "City of Los Angeles," which makes her first entry from Honolulu at the port of Los Angeles next Sunday. She is coming into port with 450 passengers which is said to be the largest passenger list, excepting on government transports, entering any Pacific Coast port. Those passengers have spent the past two or three weeks at the various Hawaiian Islands and presumably have bought quantities of fruit which they will wish to bring in to California friends. Presumably they will be informed by the ship's officers as to the Mediterranean fruit fly menace at the three mile line and all fruit will be thrown overboard. State officials will take no chances and thorough inspection is planned. A. P. Messenger in charge of plant quarantine at the port now has three inspectors. A. C. Fleury, formerly in charge of the port and now in charge at San Francisco, is here to aid in the inspection. Commissioner Ryan's inspectors and State Quarantine Officer Vary will also aid.

California is determined to keep out the fruit fly pest. It is costing thousands. It means millions.

It means the saving—or the losing—of the fruit industry.

### SOIL ACIDS

The scientists get us well grounded in one belief only to demolish it to establish another. We feared "soil acids" for years. Now a professor in Ohio state university says:

"Though organic matter in the land does in its decay make acids, these are destroyed as fast as made and organic matter is in the end more likely to sweeten than to sour a soil. With the exception of water logged or swampy soils, organic acidity is no longer believed to be of any importance.

"Acid phosphate also is said not to bring on acidity but to counteract its effects. Even such fertilizers as sulphate of ammonia, against which many colleges issued warning a few years ago, are believed not to leave sufficient acid residue under usual conditions to be of great importance.

"Industrial plants and railroads in Ohio burn each year about a ton of coal for every acre of land in the state, and this releases into thin air large volumes of a sulphur gas which raindrops gather up and deposit on the land where it changes to sulphuric acid. Illinois finds 45 pounds of sulphur per acre per year reaching soils near Urbana in this way. It would take 150 pounds of limestone alone to neutralize this acid, and to keep the soil sweet."

### MORE FIRES

In your issue of September 23 I noticed in your editorialettes an article "Fires" reading in part: "Everyone was started because some human was careless or worse." No doubt a good many of them were, but not all. One of the heaviest fires that ever raged on the San Jacinto Mountains was started by lightning. This year several were started in the sage country south of Hemet by lightning. One started the same way near Fallbrook that I know of. The one on San Jacinto Mountains and one in the sage country I saw myself when lightning struck. How many fires are the rangers sure were started by careless humans? Certainly such humans that do start fires are worse than careless and I surely do want to see all of them caught and well punished. However I hate to see or hear of some "careless human" unjustly blamed when Old Man Lightning should be. Don't you think your editorialette stands for correction?—W. S. Williams, Hemet.

We appreciate the correction, for it is one. We all know that lightning is the cause of many a disastrous conflagration, even in the California mountain regions. We have seen the statistics, and the exact figure has passed us, but we believe that lightning was charged with some 20, or possibly it was 30, per cent of our forest fires. So we will have to confess that we were perhaps a bit overzealous in our hyperbole that all fires were caused by carelessness of humans. However, we are still two-thirds to the good, and we hope the lesson will still stand.—"Be Careful."

We have all seen the carelessly tossed cigarette stub or match, less often the deserted campfire only half extinguished, or we have seen the hunter leave the smoking wad near a bunch of tinder or, again, the sparks from the exhaust of a gas engine, and it seems that the human is prone to carelessness. In order to make the lesson more impressive we may be permitted to make confession and give a personal experience.

It was nearly two score years ago when the writer of these words was a green youngster from the green fields of "back East," totally ignorant of the combusible nature of California sage, greasewood and chaparral. A field was to be cleared and the match seemed the quickest way. It worked admirably; the fire started on a wild race off of the property to be cleared. The frightened youngster did some of the hardest work of his life. The neighbors also came, but had it not been for a road and wide expanse of a dry wash aiding in the fight the loss would have been enormous. The lesson was taken to heart, and since then he has assumed that like human carelessness has caused much of our losses here in California. Hence our education is to be encouraged without taking the risks some of us were willing to take.

We still insist that human carelessness is responsible for awful loss in California and we appreciate Mr. Williams correction for we believe his desire is to make a stronger appeal by making technically correct.

By the way next week, October 2-9, is Fire Prevention Week in the United States. And Fire Prevention Week means that an effort will be made during that week to educate careless humans to have a heart and help educate the rest of us so we may all unite and help save the nearly half billion dollars which we are now charged with burning every year in this U. S. A.

Lest we be charged with a bit of over-statement again, we quote: "In the most recent estimate by the actuarial bureau of last year's contribution to the national ash heap, it was $485,000,000."

# The Southern California Fair and Other Agricultural Exhibitions

## SOUTHERN CALIFORNIA FAIR

By W. W. Van Pelt

THE agricultural fair is one of the oldest of our institutions, dating back to the fourteenth and fifteenth centuries, and competitive showing of all products of the field and farm has had its effect in the development of most that we prize today. The Percheron horse of France is largely the product of the fair, and the highly developed cattle of the English Isles, as well as the beef cattle of Scotland, are the results of development through competitive exhibits.

In this country agricultural fairs can be given much credit for both crop and livestock development. As a means of demonstrational education they are recognized as of paramount educational value. In the past, however, the fair has spread its full show of evil effects. In early times, the fair was a place of unbridled license, and according to early writings personal protection was almost a matter of personal prowess. Law and order was largely suspended and anything went. In fact, the record of one of the early colonial fairs in this country shows that King George granted a charter which contained the provision that any person "going to, being at or returning from" said fair was exempt from arrest.

The modern fair has divested itself of the old idea and is orderly and self controlled. There is entertainment, life and action; there remains a spirit of holiday and freedom, but it must be clean.

At the Southern California fair this year educational features will abound and the boy and girl with their products from school and ranch will be very much in evidence. At present the boys from the agricultural department of the high school are busily engaged in constructing the buildings and planting the crops for the miniature farm in which all departments of a well balanced farm with dairy, poultry, swine and crops pertaining to these lines in three year rotation, together with the home garden, orchard and flower garden will be shown.

The livestock judging contest by high school teams from all parts of the southern section of the state will be the leading affair of the kind in the state this year. Horses, dairy cattle, beef cattle, hogs and mutton sheep will be judged. The various schools will enter teams of three with an alternate, and they will be judged in team work. Three highest teams will go to Davis for another contest with three teams from the contest at Sacramento. The winning team at Davis will be sent to the Pacific International show at Portland.

There will be a large showing of stock in the "Junior Fair." The juniors will also have a big poultry and rabbit show. The Riverside County farm bureau is preparing a very complete dairy demonstration in which every phase of both proper and improper methods will be exemplified. Animals and the best modern equipment will be used in this demonstration.

The agricultural exhibition will be the largest ever attempted in the south, in which seven counties outside of Riverside will exhibit the best of their products and every community of Riverside County will be in evidence. The entire agricultural department display as shown at the state fair at Sacramento will be reproduced at Riverside, with some special additions from Southern California. The United State department of agriculture is making a large display

The automobile show will be most complete with a wide variety of cars in their best display style. Connected with this will be the "power on the farm" division with a big show.

The vocational department of the various high schools of the south will make a big exhibit of both methods of instruction and a representative showing of the productions of the pupils in various departments. Many of these departments will show school room work in actual operation. In some the machinery will be connected and in operation. The objects of this display will be an attempt to show to the parents the high class of work being done in our vocational departments.

The livestock show will again outgrow its former quarters and additions to barns and pens are being built. The largest showing of dairy cattle in the state will be made this fall at Riverside. Entries of dairy cattle from Arizona, Nevada and Oregon will be added to exhibits from nearly all parts of California. These entries include Holsteins, Guernseys, Jerseys, Ayrshires, Dairy Shorthorns, Dutch Belted and Brown Swiss.

The swine show also promises to exceed in both numers and breeds the show of last year which up to that time was the record show of the south. At this time we are preparing for some 500 entries in this department.

There will also be a large showing of sheep. The northern breeders feel that the field in the south is opening and they consider it advisable to show. The exhibit of farm and driving horses will be representative, exceeding, we hope, the horse show of last year.

The poultry show promises to eclipse in size and importance any previous show held at Riverside, and we believe Riverside holds the championship for poultry shows in the south. We will also have a big rabbit and cavy show.

The goat show will excel in grade of animals any previous show made at Riverside. We hold the world record for exhibition of milk goats and while we are not able to provide additional room to exceed in numbers the show of last year, we will exceed the value and grade of exhibit animals.

The fine arts and domestic arts department, the Indian crafts exhibit, the kennel club show and the wonderful exhibit in the industrial department will excel any previous effort.

But an agricultural fair must abound in entertainment features and the entertainment program at Riverside this fall is the most complete ever offered by that or any other fair in this state. The new grandstand will double the capacity of the previous one and the program will be in proportion. The horse racing promises to be fully up to the standard of previous years. Riverside holds the record of having the fastest track in the state and the horsemen seem to appreciate our effort to build up the racing game and are backing us and making great sacrifices to make this meeting. A thrilling relay race for women and one for men will be run each day. Music and a wide variety of entertainment will be furnished both afternoon and evening throughout the week.

### POINTS FROM THE PROGRAM

Partial program for the tenth annual Southern California fair.
(Races and full entertainment features each day.)

**Tuesday, October 10**

Editorial Day, Riverside County Day, City Schools Day, High School Judging Contest 8:30 a. m., Judging, Women's Department, Agricultural Department, Poultry, Rabbits and Cavies, Goat Department.

**Wednesday, October 11**

Judging Beef Breeds, beginning Shorthorns 9 a. m., Guernseys, 9:00 a. m., Holsteins, 1 p. m. Duroc-Jerseys 9:00 a. m., Hampshires follow. Sheep 9:00 a. m. Boys and Girls Clubs 9 a. m. Riverside Day. Chamber of Commerce Day. San Bernardino City and County Day. Horticultural and Agricultural Day. Guernsey Day. Rotarian Day.

**Thursday, October 12**

Governor's Day. Indian Day. Orange County Day. Kings County Day. Judging: Jerseys, 9 a. m. Ayrshires follow. Berkshires, 9 a. m., Polands, Tamworths. Livestock Breeders Day. Annual Meeting Purebred Livestock Association at 6:30, Glenwood Inn.

**Friday, October 13**

Farm Bureau Day. County School Day.

**Saturday, October 14**

Los Angeles Day. Imperial County Day. A. A. U. Track Meet and Diving Contest. Stock Parade.

## SAN DIEGO COUNTY FAIR

By Ernest Braunton

SAN DIEGO is the "easiest" place in which to hold an attractive fair to be found in California. The splendid array of buildings to which the city fell heir after the 1915 exposition leaves nothing to be desired in housing facilities and the luxuriant vegetation and ample shade which encompass them makes of itself an attraction as pleasing as any on the Pacific Coast.

In the horticultural hall there were a score of large booths representing as many fruit growing sections of the county. The rivalry was keen, and after a general survey of the hall the judges had to canvass the exhibits several times and readjust their mark ings. In the end the percentage (totals based on 100 for perfection) between leading booths ranged but three or four points.

The three chief points were quality, display and variety, and no booth won on two of them. Escondido won by a scratch on display; El Cajon as narrowly on quality and Japatul was close to the others in total points as it won on variety, exhibiting 225. The largest booths in the hall were given up to individual growers who exhibited a great variety, ranging in size from Thompson Seedless grapes to mammoth squashes and "punkkins." The grapes were most numerous and came from every section of the county, but the largest J. H. Hale peaches the writer ever saw were there by the box, peaches too large for standard pack. Chula Vista, the famous lemon center, was "there with the sour stuff," also with several summer varieties of avocados. Lewis E. Kent, an orchardist and vineyardist established at Poway since 1882 and who attends all the fairs and "reads all the numbers of the Cultivator," said this fair was the most successful yet held by San Diego County.

## TULARE COUNTY FAIR

With every inch of space available jammed with exhibits the Tulare County fair went over bigger than ever before. There were big exhibits in all department and the livestock department had to refuse further entries long before the show opened.

The Holstein exhibit was larger than at the state fair and the same high quality was evident. Hartsook and Berylwood again took most of the first places and the grand championships went to the Berylwood and Hartsook cows as at Stockton and Sacramento. W. J. Higdon, H. G. Ball, Sargent Brothers and B. F. Longan of Tulare furnished these two big herds plenty of competition and took some of the blues away from them.

In the Jerseys Jim Thorp of Lockeford was the big winner with Salome of Mossdale as grand champion cow and Biddy King of Mossdale as grand champion bull. Waterloo Jersey Farm, W. H. Bukey and S. J. Skaggs furnished the competition.

The big show in hogs was in the Poland Chinas between the herds of A. Buckland & Son, Tagus Ranch and P. B. Long. Tagus won grand champion sow with Willows Lady and Buckland had champion boar. Dr. Summerfield's Tamworths and Howard Vaughan's Chester Whites had things their own way in their classes.

## THE CALIFORNIA NATIONAL

Western breeders and cattlemen generally are watching with keen interest the second annual livestock and horse show to be held by the California National Livestock Show in San Francisco, October 14-22, because on the success of the show undoubtedly will depend the establishment of a permanent livestock headquarters at San Francisco. And in the judgment of C. M. Hawkins of the Pacheco ranch at Hollister, president of the show, and of General Manager John A. Bunting of the Mission San Jose rancho, success is assured from the high character of the entries. The horse show entries will not close until shortly before the opening date.

The entries of Shorthorns and Herefords to date exceed the entries at the recent Sacramento state fair.

Among the noted herds is the Guernsey herd of A. B. Humphrey of Escalon, one of the finest Guernsey herds on the Pacific coast. The Mills estate of Colma, through the Millbrae dairy, has entered its noted herd of Holsteins, while from Congdon & Battles of Yakima, Washington, have been received entries for 15 Aberdeen Angus. This is pronounced by experts to be the best herd of Aberdeen Angus in this country today. Another famous herd of dairy cows is the Jersey herd of J. D. Thorp of Lockeford.

In the Hereford and Shorthorn class J. D. Canary of Littleton, Colorado, has entered his prize winning herd of 14 Herefords, and the Caledonia farms of Sacramento, who are credited with one of the greatest herds of Shorthorns in this country, have entered 18. Another notable herd is that of Charles S. Howard, the San Francisco automobile man, who has entered nine Herefords; the Mission San Jose rancho with 13 Herefords and the Pacheco Cattle Company of Hollister with ten Shorthorns.

In the horse section of the livestock show a feature of interest will be the entry of Shetland ponies from F. H. Divan & Son of Monroe, Wisconsin. The Ratto stock farm at Napa has entered another of fine Belgian horses and the California Polytechnic school at San Luis Obispo, Percherons, Clydesdales and standard breed light draft horses.

The entries of different breeds of sheep have already exceeded in number the entries of last year, the largest single entry in point of numbers being that of the Corriedale Sheep Company of Hollister, the next that of J. G. Hubbard of Monroe, Oregon, who has 49 Southdowns, Oxfords, Dorsetshires and Lincolns; Bullard Brothers of Woodland, 18 head of Rambouillet sheep and G. N. Merritt & Son of the same city, 11 Rambouillet. The Straloch farm at Woodland has entered 15 head of Hampshire sheep and the University of California farm at Davis 12 fat wethers.

The entries to date, with many additional entries being received daily, are:

**Cattle**

Herefords: C. S. Howard, Willits, 9; J. D. Canary, Littleton, Colorado, 14; H. A. Baldwin, Pleasanton, 6; H. M. Barngrover, Taylorville, 5; William Briggs, Dixon, 7; H. H. Gable, Esparto, 4; John A. Bunting, Mission San Jose, 13; Millbrae dairy, 17; University of California Agricultural School, Davis, 1.

Shorthorns: A. H. Barnum, Moro, Oregon, 11; Caledonia Farm, West Sacramento, 18; Straloch Farm, Woodland, 13; T. S. Glide, Davis, 3; Estate of Thomas Dibblee, Lompoc, 6; Pacheco Cattle Company, Hollister, 10; Howard Vaughn,

(Continued on Page 347)

# Agricultural News Notes of the Pacific Coast

## Northern California

Sheep men report an abundance of feed in Glenn County.

The apple crop of Tuolumne County this year totaled 40,000 boxes.

A new species of white fly has been found in vineyards of Sacramento County.

Colusa had a "cleanup" day September 11 and not a weed remains alive in the city.

The Sunnycal Packing Company, with 250 employes, recently started operation at Oroville.

Sacramento has a popped rice factory in full swing, manufacturing the "latest" in confectionery.

Mendocino County reports pastures and ranges very dry, need of rain great, but stock in good condition.

Two carloads of Alicante grapes sold at Santa Rosa last week for $117.50 a ton, a remarkable price.

Red Bluff, Shasta County, reports September 10 as the hottest September day ever known; temperature 108.

Many Sacramento Valley ranchers, fearing a coal famine, are saving peach pits to burn the coming winter.

Cloverdale, Sonoma County, began picking a very heavy grape crop on September 10, with canneries drying pears.

Several solid train loads of grapes were sent out of Sonoma County during the first half of September with more to follow.

A cherry tree in the Giblin orchard, Sutter County, produced 1,100 pounds of Royal Ann, which sold for nine cents a pound.

Placer County will ship a total of 5,000 cars of fruit, the largest output ever produced. Newcastle ships 2,000 cars of the total.

The Anderson Valley, Shasta County, has just picked the largest prune crop in its history, much of it two and one-half tons to the acre.

According to figures compiled by Farm Advisor Robinson, Alameda County raised $10,980,000 worth of agricultural products in 1921.

Marysville, Yuba County, claims that 52 per cent of the Clingstone canning peaches in the United States are grown within a radius of 12 miles of that city.

Yuba, Sutter and Colusa Counties have organized a tri-county club and will try for possession of a common mammoth swimming pool, golf course, tennis courts, etc.

The largest realty transaction ever consumated in Sutter County came to pass September 1 when Morrison Brothers sold their large fruit ranch near Yuba City for $1,600 an acre.

Labor shortage in fruit orchards and hop fields is so acute in Sonoma and Mendocino Counties that public school vacations have been extended two weeks to enable the children to aid in harvesting.

Rice mills at Colusa have been operating 24 hours a day to get the old crop out of the way and make ready for the new crop, which begins coming in October. The rice yield in the Sacramento Valley this year is well up to normal and will be worth about $15,000,000.

## Central California

Porterville, Tulare County, reports Kadota figs bring $120 a ton or six cents a pound.

Visalia, Tulare County, reports all crops so late that canneries will run until October 15.

Watsonville reports shipments of apples from there "but" 30 cars a day, owing to car shortage.

Five carloads of Alicante Bouschet grapes sold at Modesto, Stanislaus County, for $140 a ton.

This years' almond crop was the largest in the history of the Oakdale, Stanislaus County, section.

The Modesto Bean and Grain Company has shipped several carloads of Blackeye beans to Georgia.

The small town of Sugar Pine, Madera County, was completely destroyed by a forest fire last week.

The Lindsay Farm Bureau Lime-Sulphur Company has been incorporated at Lindsay, Tulare County.

One rancher at Beckwith, Stanislaus County, is harvesting 200 acres of watermelons, employing 75 men.

The record for peach crops in the Terra Bella section of Tulare County goes to a variety known as Peak Cling.

A preserving plant at Hilmar, Stanislaus County, is now turning out watermelon marmalade by a patented process.

Thompson Seedless vineyards at Wasco, Kern County, are yielding a half ton of raisins to the acre at 18 months of age.

One hundred million fruit cans were manufactured in San Jose, this year to take care of the output of 40 canneries in that section.

Fresno will ship large quantities of raisins to Mexico, some heavy orders being received from there, also some from Central America.

Indications point to a record breaking sugar beet crop in the Pleasanton, Alameda County, section this year. Harvesting started September 20.

Manufacture of magnesite-asbestos stucco for Pacific Coast trade has been started at the Sierra Magnesite Company's plant at Porterville, Tulare County.

Oakdale cattle shippers are building ten acres of feeding yards near the railroad depot in which to hold cattle over car shortage and other troubles.

Fifteen cows died and 19 were "stuck" to save them from death by bloating through eating green alfalfa, at Crows Landing, Stanislaus County, September 6.

The European elm scale is attacking street trees in Modesto, Stanislaus County, and the county horticultural commissioner has advised spraying by the fire department.

Porterville, Tulare County, growers have announced that in 1923, from April 1 to August 15, there will be sent from that city to Los Angeles and San Francisco, at least one carload of strawberries a day.

The fourth cutting of alfalfa in a field at Delhi, Merced County, was weighed by the farm advisor and found to yield three tons to the acre. There will be at least one more cutting—a very heavy seasonal yield.

## Southern California

The Ventura Citrus Association has added a $20,000 building to its plant.

The cotton crop of the Imperial Valley will be at least 80,000 bales below the average.

The larva of the alfalfa butterfly is doing some damage to alfalfa in the Imperial Valley.

Palm Springs, Riverside County, is to have a new $100,000 hotel. The first unit is now being built.

R. R. Ryerson, of Holtville, Imperial County, has just harvested the valley's first crop of sesame.

Vineyards close about San Bernardino have sent out this season more than 10,000 carloads of grapes.

Shipments of citrus fruits from the Riverside district for the 1921-22 season will total about 3,200 cars.

On account of recent hot weather the bean harvest in Ventura County is two weeks earlier than in 1921.

The first Lima beans shipped from Ventura County this season brought $6.15 per hundredweight. There were three carloads.

Threshing of beans in Ventura County has been much retarded by heavy fogs. Threshers commence late and work until dark.

A lettuce growers exchange is being organized in Imperial Valley, the lettuce acreage being 22,000, as against 14,000 last year.

Imperial Valley shipped this year, 12,070 cars of cantaloupes and 1,792 cars of watermelons, an increase over last year of 30 per cent.

The chili pepper crop of Orange County is unusually heavy this year and estimated to be worth more than a half million dollars.

A shipload of pears and apples from the Redlands, San Bernardino County section, started for England by the motorship Loch Katrine.

Silver foxes are to be bred and reared on a 40 acre ranch leased from the government, near Camp Baldy, 80 miles east of Los Angeles.

Directors of the Lima Bean association met in Oxnard, September 15, and decided the six and one-half cent price should prevail for October.

Girard is the name of a new town east of Calabasas, Los Angeles County, laid out on lands owned by Los Angeles and New York capitalists.

Walnut growers are elated over the passage of the tariff asked for, a duty of four cents a pound on nuts and 12 cents on the meats or shelled nuts.

The outlook is for more than 30,000 acres of lettuce in the Imperial Valley this year, and prominent growers believe the market cannot absorb such a crop.

The Santa Maria Valley of Santa Barbara County shipped the present bean crop from San Luis Obispo direct through the Panama Canal to New York at 47½ cents per hundred; last year the rate was 65 cents.

Horticultural Commissioner Coy estimated in September that San Bernardino County's Navel crop for 1923 will be 55 per cent of normal, the Valencias 70 per cent, and the lemons 10 to 15 per cent. Uplands will have a lemon crop of 80 to 90 per cent.

## The Coast and General

Seattle will hold a potato show, November 11-19.

The Walla Walla Valley, Washington, prune crop will be less than 500 cars.

Heavy rains in some sections of Arizona have greatly improved stock range.

A watermelon grown at Denton, Texas, weighed 102 pounds, the 1922 record for Texas.

Dry weather has greatly reduced, below normal, the flax crop of the Willamette Valley, Oregon.

Utah reports Los Angeles buyers of sheep and lambs active in territory along the state boundary.

Bellingham, Washington, reports apples and other fruits as cheaper there than for many years past.

A survey of the Spokane, Washington, district brings an estimate of 3,100 cars of apples for the present crop.

Albany, Oregon, will have a bumper prune crop, a rain early in September checking the fall of fruit from the trees.

Cherry maggots are so numerous in parts of Washington that growers have appied for government aid in fighting the pest.

The cranberry bogs near Astoria, Oregon, are in fine condition, and the season's crop is estimated at 10,000 bushels.

Salway and Krummel peaches in the Salt River Valley, Arizona, are a heavy crop and picking season is close at hand.

The Bellingham, Washington, bean growers have been greatly helped by late rains and anticipate double the crop of last year.

The Pacific Fruit Express reports that fruit shipments to date are more than 1,000 carloads greater than to same date in 1921.

The Canadian apple crop will be about 88 per cent of last year's crop, or about 357,000 barrels. A barrel equals three boxes.

A recent order of the government forest service opens up a new pine tract near Burns, Oregon, that will yield 770 million feet of lumber.

The leaf roller is so bad in some Washington districts that the Spokane chamber of commerce, at a special meeting, decided to ask federal aid.

A report from Wharton, Texas, states that because of the scarcity of wild pecans and acorns, the squirrels are raiding the cotton fields for the seeds.

The first load of short staple cotton in the Phoenix, Arizona, district, was marketed September 10. The heaviest picking season will come in early October.

Holger, a famous bull at Shedd, Oregon, won the medal of merit of the American Jersey Cattle Club, so it was announced in New York on September 11.

The United States department of agriculture has a new hybrid barley for Alaska that this year ripened seed in 80 days. The frost free period was but 95 days.

Federal reports of cantaloupe shipments received at eastern points during first week in September were, carloads: California, 155; Colorado, 1,177. The latter state's acreage is about 100 per cent greater than last year.

# Results of Citricola Scale Control in Central California

## Address by F. R. Brann, Horticultural Commissioner, Tulare County, at Central California Citrus Institute

SINCE the citricola, or gray scale, first became established in Tulare County about 1910 the problem of its control has become a very puzzling one indeed, owing to the numerous and varied existent factors which greatly influence the efficiency of the results attained, both with regard to sprays and fumigation.

In 1912 and 1913 the infested area was confined to only about 300 acres in the immediate vicinity of Lindsay, and by 1916 it had spread to practically every citrus district in Tulare County. This rapid spread was no doubt principally due to the small whirlwinds which travel through the groves at a rapid rate during the hatching period in May and June, carrying millions of the tiny newly hatched scale to several hundred feet in altitude, thus enabling them to become established on an acreage of considerable area a mile or more distant, and all in a relatively short space of time. Thus the rapid spread of gray scale in Central California can be, I believe, easily accounted for.

The matter of adequately combating this pest in this locality is at best a serious issue, and especially is this so regarding the action taken by the horticultural commissioner in the performance of his duty with respect to the abatement of such a nuisance. He must adopt the most efficient known means of control determined upon the basis of averages, otherwise a serious kickback is the result.

The horticultural office of Tulare County has through its field inspection secured complete data covering all fumigation work in the county since 1915, covering a total of 14,626 acres, or approximately 1,316,340 trees, not including the 1922 operations. A complete detailed record of each night's operations has been preserved and is now on file in the horticultural office, Visalia.

It has been impossible to secure such detailed data on commercial spray work due to the facts that the field of operation was so great in extent and covered such an extended period of time that sufficient inspectors of ability were not available, also no satisfactory agreement had been reached with the commercial sprayers for reporting work done until this season. Therefore the data secured covering scale control work as dealt with in this paper so far as sprays are concerned is based upon work done this year, while data covering fumigation work is from the operations of last year with further reference to work done previously. It may be well to state here that as no post examination of treated groves is made before at least 30 days after date of treatment, only a very few of the groves fumigated this season have been examined and reported on. However, on these few groves the results have been very satisfactory.

### Method of Inspection

A careful inspection of the groves previous to treatment is made, using the hourglass system of covering the area. A plat is made and all conditions noted and tabulated and reported to the owner of the property, and a copy is mailed to the horticultural office for filing. The post examination is made not less than 30 days after treatment is applied. The inspector carries a copy of the previous report and follows the same route as taken when first inspection was made. A pair of Bosch and Lomb field binoculars with a magnifying power of three diameters and a 62 M. M. aperture are employed in observing scale condition, and in making count, and for the keeping of this count, a small tallying register is used. Sample leaves are taken from the portion of the tree showing severest infestation. Thus the inspector is enabled to note any unusual conditions as he goes along securing his samples, and makes his notes accordingly. The results are reported on forms for that special purpose—one copy to the owner, one to the horticultural office, and a third copy retained by the inspector.

The post examination work is extremely tedious and tiresome to the eyes, for the number of scale bodies actually observed to determine whether they are alive or dead, very often exceeds 20,000 on a 10 acre grove.

### Factors

In summing up the various determining factors more or less governing the development of citricola scale on treated properties, we find that there are three natural factors which are more or less beyond immediate human control, viz., 1. Atmospheric conditions. 2. Condition and nature of adjoining lands on the west and north. 3. Tree condition. The natural mortality of citricola scale is induced by exposure to high atmospheric temperatures, together with a low degree of humidity.

The three principal controlable factors are: 1. Proper formula and strength. 2. Manner of application. 3. Date of application.

During the 1922 season to date 47 commercial sprayers and 2 fumigating concerns were operating under Tulare County licenses. There were approximately 70 commercially operated spray rigs.

In addition to commercial spraying done in Tulare County there are approximately 100 growers or more who own or operate their own spray rigs, and from which practically no data has been secured by this office.

### Summary Citricola Scale Control

So far this season there have been over 5,000 sprayed acres reported to this office. We are daily inspecting and reporting on these jobs, and to the 25th of August we had inspected and reported on 3,600 acres of this work. We have segregated these reports in groups according to the formula or solution used, then into groups according to dates of application, etc., endeavoring to determine as nearly as can be approximated the relative effectiveness of these different materials and the dates that sprays can be applied with the maximum of results. We have also tried to work out other points that should influence the grower in making his selection of proper material when combating this insect.

During this inspection work we have observed that there is in some cases apparently a slight effect of the spray remaining on the trees even though the spray is claimed to affect results only by contact at time of application, and any such increase in mortality on these groves, more than the natural death effected by climatic conditions, can be determined by later inspection of these groves. It is our intention to inspect many of these groves at a later date to secure data on this point.

The manner of application is a point of more importance than is realized

(Continued on Page 349.)

# Two Boxes to the Three-Year-Old Tree in Florida

## By C. B. Messenger

FLORIDA grown pineapples are good, or rather, I should say, a Florida grown pineapple is good, for the pineapple treat has been mine but once. And the best of it is that the pine was grown by a subscriber of the California Cultivator. It was really quite surprising to enter a home in a beautiful little orange grove near the Gulf of Mexico, a bit north and west of the city of Tampa, and there be greeted by the familiar California Cultivator lying on the center table. The copy of the Cultivator had to give way to make room in the place of honor for the aforesaid pineapple.

Three Year Old Avocado

The man who looks like a farmer is a real one though now past 81. He is Mr. Hampton. The younger man on the reader's right is Edgar A. Wright, editor of the Florida Grower who is jotting down notes which Mr. Hampton is giving him regarding growing avocados, oranges and other fruits on Florida's west coast.

The story of it is this. I was in Tampa and called at the office of the Florida Grower, edited by Edgar A. Wright, a former Californian. We had hardly finished talking about the weather when Mr. Wright suggested an immediate start for New Port Richie as he had an invitation from an old time Florida grower to come out and inspect his grove, a taste of the home-made pineapple and to inspect a wonderful section which is just being developed. The acceptance was as quick and as hearty as had been the invitation and after a short trip to the suburbs of Tampa and an inspection of Mr. Wright's beautiful home grounds, we were on our way over an almost perfect pavement through Oldsmar, Tarpon Springs and other beautiful towns to the home of B. M. Hampton at New Port Richie. Mr. Hampton has been in California several times, but his orange growing experience is largely in Florida and he has been in the game until he has learned success in citrus culture.

The first feature of the trip to Mr. Hampton's place was an inspection of his orange, avocado, mango, paw paw and other semi-tropical trees besides a vineyard and a lath house where his pines were growing. Ultimately we reached the stage where the pineapple was served. Mr. Hampton's daughter, Mrs. W. E. Dartnell, served the fruit and without sugar. It had manufactured its own sugar and was of perfect quality. Likewise unfermented juice of the old time Scuppernong.

But about Mr. Hampton's place and his methods of cultivation which have produced results almost unbelievable I am going to take extracts from an article which Mr. Wright wrote for his own paper, The Florida Grower. While Mr. Wright was taking notes I was taking photographs, two of which are used on this page. I will say first, however, that all that Mr. Wright tells of the remarkable growth of those trees but little more than three years old is fully borne out by the trees and the crop of fruit which they are carrying. After touching upon the trip to Mr. Hampton's place Mr. Wright adds:

Velvet Beans for Cover Crop in Florida

Citrus orchardists in Florida grow their cover crops in summer. Velvet beans, beggar weed and natives are encouraged, some orchardists even allowing growth to come up through trees. This photograph was taken in the orchard of B. M. Hampton at New Port Richie. These trees were set three years ago last March and the orchard will average close to two boxes per tree.

"By we I mean Editor Messenger of the California Cultivator of Los Angeles, his good wife and myself. We left Tampa early in the afternoon and were in one of the suburbs of New Port Ritchey, a city that I had seen grow from one house in 1912 to one that now supports a bank and a newspaper. We had been somewhat amused at the big sounding names of the byways in this part of town. I think we were on Nebraska Avenue; However, this is not meant as a reflection on New Port Richey; it could not be expected that we would find paved avenues a mile out from its center in all directions, and this was one of the directions where other developments had gone ahead of street improvements.

Three years ago in February Mr. Hampton's place was uncleared. In March he set his first citrus tree and completed the planting in June. He has done all of this work himself, from the planting and bringing this grove to successful bearing. I asked him if he never hired help and he stated that only when he was spraying, as it was then necessary for one man to attend to the pumping while the other directed the hose nozzle. I submit that this is a remarkable feat for a man of his

age; I feel much younger for having met him, and somehow I feel better and happier for having seen him.

No Such Animal

There is a story often told,
That always makes us smile,
Said Rube to his first elephant,
"There ain't no sich animile."

"You can't expect a crop of oranges on three year old trees," says the expert, "it can't be done. Some people talk of such things, but it's not so, there ain't no such animal."

Well, I never thought there was myself. Oh, of course a few fruit at that age and maybe a prodigy tree would show quite a crop, but to expect a three year old tree to yield a paying crop would be expecting too much.

An Old Timer

Mr. Hampton's letter to me gave no inkling that he was an old time grower. As he had just started a grove I supposed that he was a tenderfoot, a man who, attracted by the climate, had gone into the citrus game just to keep him out of 80 year old mischief. It did seeem to me that his claims were rather extravagant. However, I find that he is an old timer, that he came to the state in 1890, and that he has made and sold three successful groves in his career, one at Avon Park, one at Frostproof and one at Winter Haven, the latter grove he now believes to be in possession of manager C. W. Barnes of the Winter Haven Citrus Growers' Association. I find that Mr. Hampton used to take an active part in the meetings of the Florida State Horticultural Society, and that he was an intimate friend of the late Dudley Adams, once president of the society, himself considered an expert, and who followed much the same lines of cultural procedure now followed by Mr. Hampton. Mr. Hampton was often called upon to read papers on cultural subjects before the society, and took a prominent part in the discussions. He has not been active in these meetings since 1909 and that is why I had never come into contact with him, my first attendance being in 1911. I suggest that the secretary call upon Mr. Hampton to read a paper entitled, "How an 81 year old man made three year old orange trees produce over three boxes of fruit with the minimum of fertilizer." This is just what he has accomplished, and has the goods to show for it, and if the old saying "make a success and the world will beat a path to your door," be true, the Port Richey people will have to improve and widen Nebraska Avenue and it should become one of the best known streets in citrus Florida.

Seminar in a Nutshell

He is success personified, and living proof that "it can be done," a whole Citrus Seminar at a glance, every tree a sermon on culture and the master director this kindly old man who has done it all; this smiling, friendly, contented man, who claims to be a friend of Luther Burbank and acquainted with all the old time growers of Florida, Dudley Adams, W. S. Hart and many others. As a soldier he marched with Sherman to the sea, later he roamed the West, saw Indian fights, killed his grizzley, became miner and afterwards rancher. He was in Los Angeles in 1872 when that city had a population of 5,000, and when he could have bought the land that is now the corner of Seventh and Broadway for $10 an acre.

Well, of course I wanted to know how he had done it all, how he had brought about this seeming marvel in production. I quickly gathered one fact, and that is that the land itself is the first consideration. It is a rolling pine land and was covered with a second growth, this growth consisting of oak and small pine. This land has a marl subsoil. In the main part of his grove this subsoil is nine feet deep, but as the land slopes down it comes to within four feet of the surface, and on the very lowest of it he sometimes turns over marl in his cultivation. After getting the right land it is only a question of experience and common sense. "Cultivation is fertilization," he says, and he cultivates every two weeks in dry weather and often enough in wet weather to keep the weeds down. Never deep, "no sir," he says, "don't cut off the feeder roots. Never use a mold board plow and never harrow over three inches deep. Put much of your fertilizer in through cover crops every fall." His cover crop of China velvet beans is thick, luxurious, yet he tells me that he has never fertilized it. He keeps the ground under the tree branches clean at all times, weaving a sort of figure eight as he goes from tree to tree with his tractor. I forget how many pounds or tons of nitrogen to the acre he gets from his beans in the fall, but I know he values this cover crop highly.

I remember once that a very rich man in Florida wanted to make his the very finest grove in Florida, a matter of pride, as he did not need the money from his fruit. He gave a fertilizer man carte blanche in his grove and this man put so much fertilizer on that he nearly ruined the trees. On the other hand Mr. Hampton seems to be seeing how little commercial fertilizer he can use, and he apparently has made a wonderful success.

Asked as to the cost to fertilize he gave me the following rather amazing figures. In 1919 he used 150 pounds of cotton seed meal, 150 pounds of nitrate of soda and 125 pounds of other commercial fertilizer. In 1920 1000 pounds of 4-9-4 at a cost of $26.68. In 1921, on February 15, 1000 pounds of 4-9-4; June 1, 800 pounds of 4-7-3 and November 15, 1200 pounds of 2-8-10; at a total cost of $76.08. In 1922, on January 27, 1200 pounds of 4-8-5; June 13, 900 pounds of 4-6-8, and August 10, 250 pounds of 4-6-8, cost for 1922, $53.23, or a total cost for the three years of $155.99.

"Last year when the trees were two years old," he said, "I sold fruit to the amount of $405.85 and at that I lost 50 per cent of my tangerines in the hurricane and much other fruit. We also had all we wanted to eat, we gave away some to our neighbors, and we shipped a number of boxes as presents to friends. An old house that lay to the south of the grove was swept through my trees and damaged some of them quite badly. This year the drouth threatened to strip my trees, but I hustled around and put in a well and wind mill and manager to save some of the crop."

Saved a part of the crop. Ye gods! The trees could not carry more. On one tree about eight feet high, and with about the same spread, there were 136 oranges on one branch.

Wonderful. How does he do it? Well, he has tried to tell you. He always insists on getting the best stock, sometimes picking out his nursery stock himself; each individual tree. Next comes the planting and he has his own way for doing that. Then the cultivation, the fertilization and spraying. Spraying is important with him and he will have 90 per cent of perfeot fruit. Cultivation is his hobby and he tells me that he does all this work between daylight in the morning and breakfast, going over the grove in two mornings with his little gas tractor and disk cultivator. I asked him if it was not a hard job to walk behind this little utility cultivator, and he replied: "Shoo, I run the dickens out of it."

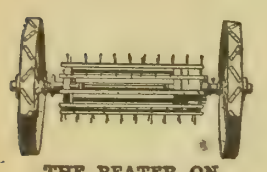
"I notice," he said to me, "that a writer in your paper advises against the burying of roots and other woods in the tree rows, the objection being that this procedure would bring lice. It might if this wood was allowed to rot on the top of the ground, but not if you bury it. If I have any secret of success it is that of using palmetto roots and oak limbs and stumps this way. Not pine, because pine will not decay quick enough. The young rootlets just revel in this rotting wood and they get enormous quantities of potash from it, particularly from the palmetto roots. I think it was State Chemist Rose who once stated that the burnt ash of palmetto roots contains 40 per cent of potash, but I understand that he since denies making such statement. Other authorities state that the potash content is 10 per cent. I believe it to be a great deal more. There is a strong taste of potash in the ash of the palmetto root."

Mr. Hampton states that there is nothing like steamed bone with which to start a young grove. He did not use it this time for the reason that he could not get it just when he needed it. He also tells me that he used a considerable amount of wood ashes the second year, this not being counted as expense because he made the ashes himself.

Count the different kinds of fruit he has on his little place. Oranges, grapefruit, papaya, figs, pineapples, avocados, bananas, peaches, guavas, grapes, surinam cherries and mangos. He is particularly proud of his mangos and avocados. The young avocado tree in the picture is two years old and 11 feet high. He has a two year old mango that yielded over 40 fruit last year, some of them ten inches in length, all of them very large. Papayas are hanging on the trees nearly as big as watermelons, grapes are just getting ripe and guavas are wasting themselves on the ground.

# Only One Spreader Has the Beater on the Axle

—That's the John Deere. This patented feature makes possible these distinctive advantages.



THE BEATER ON THE AXLE

**Easier on you.** Box only 36 inches high—from 6 to 10 inches lower than any other. In loading 100 loads of manure it saves in energy the equivalent of that required to lift a ton of manure on the end of a pitchfork to the height of an 8 to 12-story skyscraper.

**Easier on your horses.** High drive wheels—4 to 8 inches higher than on other spreaders—reduce draft and increase traction. A close-fitting endless apron carries the load back to the beater on 48 smooth-running rollers. You know it is much easier to roll a ton of manure than it is to drag it.

**Does a better job of spreading.** The John Deere is a real spreader—not merely an unloader. You can load it flat on top, insuring even distribution its entire width. The revolving rake—self-operating—prevents bunching. The one beater, which is low down, does not lift the manure high in the air—side winds do not cause drifting—an important point.

**Lasts longer.** The simple beater drive, mounted on the axle, operates in a dust-proof, oil-tight case—lasts for years. No clutches—no chains—only one beater—practically half the parts necessary on the ordinary spreader.

These are only a few of the many John Deere Spreader advantages. See it at your John Deere dealer's. Make comparisons. No other spreader will give you these distinctive money-making advantages.

**Write Us for This Valuable Book**

# Millions Buy from this Book on Faith in the Name "Montgomery Ward"

**Interesting stories from three of our oldest customers**

"I received my first Montgomery Ward price list in 1872, and I became a customer almost immediately. The catalogue has been coming regularly ever since, and I have been doing business with Montgomery Ward & Co. practically all of that time.

"I wish to state, that in all of those years there has never been any occasion to make a complaint or to return any goods we have ordered from Montgomery Ward & Co."

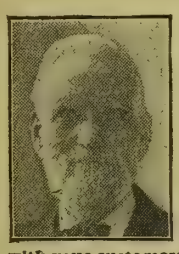
**William McCandless, Sloan, Iowa**
**A Customer Since 1872**

For fifty years, ever since Montgomery Ward & Co. was started, Mrs. Merrick has taken a keen interest in its development.

"I have been a customer from the first.

"I have always had the most courteous treatment from you," she said. "I believe that much of your success has been due to your unfailing policy of fair dealing."

**Mrs. Emma E. Merrick, Malcolm, Iowa**
**A Customer Since 1872**



Mr. Beatty is a real pioneer. He is the only man now doing business in Helena who came to Montana in 1862. He served under General Johnson in Utah (1857-8). He finally settled in Winston, Montana.

"I have traded with Montgomery Ward & Co. for 45 years," he said, "and I have never found anything wrong that has not been satisfactorily settled. If you continue to deal as fairly with your customers as you have in the past you will surely prosper."

**Mr. George Beatty, Winston, Montana**
**A Customer Since 1877**

This book is saving many millions of dollars for the American people.

Is it saving money for *you* and for *your* family? Are you taking *full advantage* of your opportunity?

This book—our Golden Jubilee Catalogue—celebrates our 50th Anniversary by offering you the lowest prices possible on everything for the Home, the Farm and the Family.

It is filled with bargains—with merchandise of high quality. And every price is a Money Saving price for you.

For Fifty Years Montgomery Ward & Co. have earnestly worked to serve the American people.

Today millions of people are buying from this book on faith in the name "Montgomery Ward."

And it is our policy to keep faith with our customers. It is our policy to sell only serviceable goods, to serve you promptly — always to offer you a saving — and to deal with you always in the full spirit of the Golden Rule.

Montgomery Ward & Co. begins its second half-century of business existence. Yet today it is filled with the spirit of youth; alert, looking ahead, improving its service, filling orders quicker, and offering lower and lower prices.

To buy from this Golden Jubilee Catalogue is to be guaranteed a definite saving and entire satisfaction—and back of this guarantee is the reputation of Fifty Years of fair dealing.

**Buy from this book. Fill all your needs from this book. Consult it daily to find the right price, the lowest price for dependable, reliable goods of standard quality.**

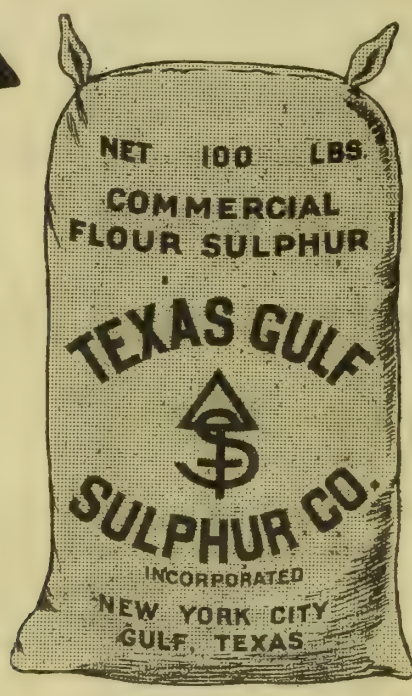
# "Best for Alfalfa"

# TEXAS GULF SULPHUR

(*Identify the genuine by this trademark*)

A better sulphur at a better price direct from the mines of the Texas Gulf Sulphur Co., the world's largest producers of sulphur. In order to fully serve the alfalfa growers in this territory we have established a warehouse in Portland, Oregon, from which we will make quick shipments of the genuine Texas Gulf Sulphur in any quantity. You will find the product, the price and the service right in every respect. No matter where you have been securing sulphur in the past you will find it greatly to your advantage to place your order with us this season.

*Contains 99½% Pure Sulphur*



*Packed in 100 lb. Burlap Bags*

## *Your Choice of Three Forms:—*

### *Crude Sulphur—*

Lump sulphur, 99½% pure, for those who prefer to do the grinding.
In bulk or 150 lb. bags

### *Flour Sulphur—*

Ground to extreme fineness, ready for immediate application to the soil. This product is so finely ground that it is in every respect equal to special brands for which high prices are commonly charged.
In 100 lb. burlap bags

### *Inoculated Sulphur—*

An exclusive Texas Gulf product. Specially ground flour sulphur inoculated with sure-acting oxidizing bacteria which make the sulphur quickly available for plant food. As commercial sulphur is apt to be inert in the soil and its full effects are usually not noted until the second season, we advise the use of Texas Gulf Inoculated Sulphur where quick action is needed, and especially for late applications. In any event, test it on an acre or two this season and compare results.
In 100 lb. burlap bags

### *Consult your County Agent*

We will gladly cooperate with him and with you in handling club orders. Naturally, you can save money by joining with your neighbors and making up a carload order.

### *Wire us at our expense—now!*

Send us a night letter, *charges collect*, tonight. Tell us your alfalfa acreage, the kind and amount of sulphur you will require, the name and address of your county agent or dealer. Address as below. We will promptly quote prices which will delight you.

# The French Prune, Why?

By Leonard Coates

THE question is suggested because, first, there are so many climates in California, and, second, there are many varieties of prunes, suited to as many different climatic conditions. It is neither reasonable nor consistent to grow one variety of fruit arbitrarily within the boundaries set by the surveyor's chain, nor is it logical, in a similarly arbitrary manner, to extend the distribution of a certain fruit beyond those boundaries.

There are as many "climates" in California as there are in France, and the area of the two countries is about the same. While in France the particular section of country in the Province of Loire et Garonne is the only part where the "French prune" is grown, in California its geographical distribution is constantly being extended North, South, East and West almost to the coast. The product cannot all be of the same quality, any more than may the productivity per acre average the same. Therefore, it would be wiser to consider the planting of varieties of prune suited to these varying conditions rather than try to force one variety to flourish in such changeable environment.

### Quality

Another point which might also be accepted as absolutely existing is the equally varying taste of the consumer, and what is included in the term "quality." That elusive something called "quality," and its acceptance by the consumer is, after all, paramount. It cannot be defined except by the persistence with which the consumer asks for "more," and no amount of talk by the paid booster will influence this permanently. You may establish a grade, you may say it is the best, but it is no more possible to halt the wheels of progress in the improvement of fruits than it is in the advancement of the knowledge of electrical force.

Another factor which must be considered is the dehydrator. It is worse than useless to decry it, or to seek, however subtly, to depreciate the product. It might as well be recognized that the fruits and vegetables of the future will be the dehydrated product, and California growers, if they would continue to lead, should not forget this. If the dehydrator produces a more palatable food it is waste of time to tell the public that some other brand is better because it is dried in the sun. As a matter of fact, the argument in favor of the former would be the stronger. It is not necessary, nor would it be expedient, to particularize too closely by suggesting the reasonable limitations for the growth of any one variety of fruit. Antagonism would naturally be aroused, and no good attained.

### In The Northwest

The great Northwest, including Oregon, Washington, Idaho, Colorado, is growing large prunes, not quite so sweet as the smaller French prunes, but preferred by a large number of people. Before these are all dehydrated and marketed under one brand, California would do well to prepare for this competition. Many parts of our state can produce this article more nearly perfect than the "French prune," and therefore it should be given the preference. I have in mind some improvements in the Italian or "Fellenberg" prune, and other originating further North, which, I am testing.

### Climatic Conditions

We have a great variety of climatic conditions suitable for the growing of almost every variety of fruit known, but even where the same climatic conditions prevail there are, often times, numerous varieties of soil which make it possible to grow a variety of fruit to perfection in a certain part of a locality while just a short distance away it will be a failure either in production or quality.

When fruit is scarce and prices high it is possible to grow it, at a profit, under somewhat adverse conditions but just as soon as the supply becomes sufficient to meet the normal demand, only those growers having ideal conditions for the production of the varieties they are growing can hope to make a profit on their investment while their less fortunate competitors will operate at a loss.

### Overproduction?

In the writer's opinion it is better to plant some variety of fruit, that is seemingly overdone, in a locality where it grows and produces to perfection rather than plant something (just because it happens to be high) that is not suited to the locality and which will never produce as it should. Always bear in mind that when the production becomes greater than the demand only the best quality fruit will sell at a profit, or at any price for that matter, and the growers operating under adverse conditions will have to graft over or pull out their trees which soon reduces the supply to the point where prices will again advance and one is assured a nice profit on the investment for a number of years.

## FRENCH PRUNE, WHERE?

By W. R. Wood

Leonard Coates' article, "The French Prune, Why?" appearing above contains some valuable thoughts for the California horticulturist.

There is no question but that in certain parts of the state the French prune is to be desired above all others, while in other parts some of the larger varieties should have the preference. This is especially true if we consider the dehydrator as a factor in the drying of those varieties that are too large or lack sufficient sugar to make sun drying practical.

The same rule holds true with all other fruits being grown in the state. There are many acres of fruit planted each year that will never yield a profit to their owners simply because they are not suited to the locality in which they are planted.

These same varieties would no doubt, pay a nice profit if planted where conditions were most favorable for them.

## PLACER CONVENTION

The Placer County Fruit Growers Convention will be held at the Court House, Auburn, October 4, under auspices of the farm bureau, the farm advisor and horticultural commissioner.

Wednesday morning 9:30—Report of Convention Committee, J. A. Teagarden; Relation of Fruit Growers Convention to a Deciduous Fruit Program for Placer County, C. W. Rubel, assistant state leader; Soil Fertility, Plant Food and Cover Crops, J. W. Nelson, assistant state leader; The Future of the Fruit Industry, F. W. Reed, state department of agriculture.

Wednesday 1:30—Caldwell Method of Training Trees, W. A. Caldwell; Long Pruning in Placer County, (Committee Report), E. L. Rippey, E. A. Francis, George Lamiman and H. E. Butler; Principles of Long Pruning, Warren P. Tufts, assistant professor of pomology; Federal Appropriations in the Interest of Horticulture, R. N. Wilson, secretary agricultural legislative committee; Cost of Production. (Committee Report), S. C. Day and M. R. Struble; More about Plum Pollination, Prof. A. H. Hendrickson, in charge deciduous fruit station, Mountain View.

Thursday, 10 a. m.—Quarantine and Standardization Enforcement, G. H. Hecke, director state department of agriculture; Some Observations on Eastern Fruit Markets, Charles Werner and J. A. Livingston; Export Markets, J. E. Bergtholdt; Disposition of Cull Fruits, W. V. Cruess, assistant professor of fruit products.

Thursday afternoon, 1:30—Wormy Peaches (Committee Report), C. V. Freed; Results of Peach Twig Borer Test Plots, W. P. Durus, entomology division of university; California Experiment Station, C. M. Haring, director; Pear Blight, D. G. Milbrath,

plant pathologist; Crop Reporting, agricultural statistician, U. S. department of agriculture; Some Practical Aspects of Bud Selection, J. Barnicott; Placer County Tree Troubles, Ralph E. Smith, professor plant pathology; Maturity of Fruit, (Committee Report), J. A. Teagarden; Exhibit at the State Fair, discussion by growers; Committee reports, etc.

### CAR SHORTAGE

As a result of numerous conferences held by the traffic officials of the different transcontinental railroads and state officials, during the past few days, with reference to the refrigerator car shortage, which has become so acute, definite action has been taken whereby the division of markets of the state department of agriculture will take official charge of the car conservation program in this state, to the end that shippers holding cars over 24 hours for loading and unloading will be strictly called to account.

Fred N. Bigelow, chief of the division of markets, and James P. Britt, assistant, have formulated plans for the control of the situation in the southern portion of the state and will institute a check on all shippers and receivers, in order to expedite the release of refrigerator equipment. Unless prompt and decisive action is taken, the 50,000 refrigerator cars estimated to be required to move the grape crop of the state during September and October, will not be forthcoming, resulting in serious loss, not only to the producers of the state, but to allied industries dependent upon the success of the proper marketing of the agricultural products.

### APRICOT GROWERS FIELD DAY

The apricot growers department of the Ventura County farm bureau in cooperation with the agricultural extension service are making plans for their first apricot growers field day to be held in Ventura some time during the latter part of October.

This field day is supplementary to the first apricot institute held in the state last spring and will discuss the major problems of the industry which can be worked upon this fall and winter. Frost control, brown rot and the black scale situation will be discussed with a field demonstration on the pruning of trees infected with brown rot, also proper spraying methods.

### DELICIOUS

It is possible the finest apple ever produced is one which was a chance seedling, discovered within the last third of a century. The Delicious perhaps possesses finest qualities for eating or cooking, and the tree stands up under more abuse from blizzard or summer's heat and drouth than any other and, still more satisfactory to the grower, is reasonably sure to come across with big production.

The reception which this fruit met in the market impelled some of its friends to ask a recognition of the discoverer of the apple. Pomologists met at Council Bluffs, Iowa, and dedicated a monument to Mr. Hiatt, discoverer of the apple. In making address at the time of the dedication, Prof. C. I. Lewis, formerly of the Oregon agricultural college, and more recently editor of the American Fruit Grower, said:

"The Delicious apple represents the crowning point of achievement in the origination of American varieties. No variety has been originated which is superior to the Delicious in quality; few can equal it in production. On the Pacific Coast where I am very familiar with orchardng it is not uncommon to find this variety yielding as high as 750 packed boxes per acre, whereas some of the older varieties often do not yield more than 200 boxes per acre. The high yielding varieties like Delicious, Jonathan, Winesap, Stayman and the Winter Pearmain, which tend to produce annually big crops, are the varieties which are making fruit growing profitable in the West. No apple of American origin ever had quicker distribution than the Delicious and none was ever accepted more readily by the American public. It is one of the best known varieties which we have, and rightly so, for its large size, its beautiful color, its delicious aroma and quality. In the origination of the Delicious apple a high standard has been set for us in the development of future varieties. How proud the state of Iowa must feel that it was the mother of this wonderful variety. Gradually some of the older varieties are slipping by the wayside; the Baldwin has probably passed its zenith, being an irregular bearer, winter killing frequently and being subject to Baldwin Spot, which contributed to restrict its planting.

'The future is going to see the demand for quality fruits, coupled with productiveness, vigor and good appearance. We see through all the ages man has gone through all sorts of hardship and privation to carry fruit with him to the ends of the earth. As a result, some races, especially in the tropics, subsist on fruit alone."

### AUSTRALIAN SCALE PARASITES

W. W. Froggatt, government entomologist for New South Wales, announces: "During the past season Luke Gallard, orchard inspector, has carried out further investigations regarding the life history of the Chalcid parasites that keep the olive scale (Lecanium oleae) in check in the County of Cumberland. He has bred out two generations of the scale, together with two broods of parasites, during the year.

"He says: 'In October I noticed that a number of young scales which emerged in September had developed a soft covering. These I kept under notice till January, 1922. They were then full grown and an occasional parasite had emerged. I collected 219 scales and put them away in a tube. From these I took about two dozen 114 adult parasitic wasps, thus showing that a fresh batch of both scale and parasites had passed through a complete cycle between the middle of August, 1921, and the middle of January, 1922.'

"Mr. Gallard also states that, in addition to the parasites noted in previous communications, he has bred another remarkable undetermined yellow species with banded wings extending well over the tip of the abdomen."

### YOUNG PEACH TREES CAN BE GASSED

September is the month to gas peach borers with paradichlorobenzene. Recent researches in New Jersey show that this method of attack may be useful in young peach orchards as well as in orchards of mature trees.

Provided only a half ounce of the powder is used to a tree, and provided it is left around the trunk of the tree no more than three weeks, paradichlorobenzene may be used to protect vigorous peach trees under six years of age, it is now believed.

For vigorous, fully mature trees, an ounce of the chemical may be used, and left in place a month. Previously it was thought that young trees could not stand the treatment, but now it appears that this is more a matter of tree vigor than of age.

The chemical is laid in a ring around the trunk, where it releases a gas that seeps into the ground and kills the borers. Ohio orchardists tried this method for the first time last year and found it entirely successful.

# Note these New Prices on U.S. Tires

ON July 29, 1922, the lowest prices ever quoted on U. S. Passenger Car Tires went into effect—Royal Cords included.

These new prices should give confidence to dealers and car-owners that no lower basis of quality tire prices will prevail.

Bear in mind that these prices apply to the most complete line of quality tires in the world. Remember, too—as you read the following table—that U. S. Quality has been positively maintained.

| SIZES | Royal Cord | FABRIC Nobby | Chain | Usco | Plain |
|---|---|---|---|---|---|
| 30 x 3 Cl. | —— | $12.55 | $11.40 | $9.75 | $9.25 |
| 30 x 3½ " | $14.65 | 15.60 | 13.00 | 10.65 | —— |
| 31 x 4 " | —— | 23.00 | 21.35 | 18.65 | —— |
| 30 x 3½ SS. | 14.65 | —— | —— | —— | —— |
| 32 x 3½ " | 22.95 | 20.45 | 16.90 | 15.70 | —— |
| 31 x 4 " | 26.45 | —— | —— | —— | —— |
| 32 x 4 " | 29.15 | 24.35 | 22.45 | 20.85 | |
| 33 x 4 " | 30.05 | 25.55 | 23.65 | 21.95 | |
| 34 x 4 " | 30.85 | 26.05 | 24.15 | 22.40 | |
| 32 x 4½ " | 37.70 | 31.95 | 30.05 | —— | |
| 33 x 4½ " | 38.55 | 33.00 | 31.05 | —— | |
| 34 x 4½ " | 39.50 | 34.00 | 32.05 | —— | |
| 35 x 4½ " | 40.70 | 35.65 | 33.55 | —— | |
| 36 x 4½ " | 41.55 | 36.15 | 34.00 | —— | |
| 33 x 5 " | 46.95 | —— | —— | | |
| 35 x 5 " | 49.30 | 43.20 | 39.30 | | |
| 37 x 5 " | 51.85 | 45.75 | 41.70 | | |

*Federal Excise Tax on the above has been absorbed by the manufacturer*

The dealer with a full line of U. S. Tires at these new prices can serve you better than you have ever been served before in the history of the automobile.

If there ever was any fancied advantage in shopping around for tires it disappeared on July 29, 1922.

**We will allow 5 per cent for cash with order or 2 per cent for cash in 10 days from invoice date.**

All prices are for tanks complete, ready to erect, K. D., F. O. B., Pittsburg, Cal.

Complete instructions for erection accompany each tank. If erected accordingly, we guarantee a watertight tank.

Order from Above List

**We supply towers ready to erect at low prices, or will give you tower plans with your tank.**

**Redwood Manufacturers Company**

1604 Hobart Building, San Francisco
308 East Third Street, Los Angeles

# Legal Queries

**Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.**

**Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When queries are wished in Cultivator address query to 317 Central Ave., Los Angeles.**

### Fence Near Line

I erected a hog tight fence around my land. The posts, wire and labor were all paid for by me. The posts are on the lines but the wire is on my side of the fence. Can I move a portion of this fence without getting the permission of the neighbor. Do I have a right to take the fence down if I choose?—Subscriber, Bakersfield.

As the fence was erected at your own cost, apparently upon your own land, unquestionably you have as much right to remove the fence or take it down as you would have any other structure located upon your own property. It is only where the adjoining owner contributes his portion to the cost of the fence, or where the fence might be the sole means of establishing the boundary line, that you would be prevented from removing it.

### Support of Minor

I have a daughter who becomes eighteen on October 4. I have been paying the mother $25 per month until she becomes of age. How much must I pay in October?—Subscriber, Fullerton.

If the payment was by the contract or order to be made upon the first of October, undoubtedly it would be necessary to pay the full amount.

### Chickens Trespassing

A neighbor who lives across the road keeps chickens. They get into my young alfalfa field and do considerable damage. I have notified the owner of the chickens several times to keep them home. Can I shoot the chickens or put poison out for them? Can I put a chicken fence up and make the owner of the chickens pay one-half of the cost?—Subscriber, Wasco.

The killing of a trespassing domestic animal can be justified only by proof of necessity for the protection of property. Such necessity must exist at the time the animal is killed and the person killing is held in a due regard for the relative value of the property about to be injured and that of the animal killed. He would not be justified in killing a valuable animal found destroying property of comparatively little value. Dogs may be used in driving off trespassing animals and as a general rule the land owner is not liable for injury inflicted by them where they are not vicious. When a person places poison on his premises with intent to kill animals or others trespassing on his land he is liable for the injury or loss of such animals as may be poisoned by eating the food, although he notifies the owner of the animals of his intention to put out poison food. It is only where the boundary line of adjoining owners is co-terminous that one owner can require the other to pay his proportion of the cost of the fence and then only when the other has fenced his land. (We believe that where a land owner is honestly making a campaign on squirrels, gophers or other trespassing wild rodents and puts out poison baits, and gives notice that poison is out, he is blameless of any loss that may come because of livestock trespassing on his property and securing the poison.—Ed.)

### Ownership Along Stream

I own land bordering on the San Joaquin River. Am I entitled to wood growing on the banks of the river and can I keep people from trespassing upon my land?—Subscriber, Viola.

Except where the grant under which the land is held indicates a different intent the owner of the land, when it borders upon a navigable lake or stream where there is no tide, such as the San Joaquin River, takes to the edge of the lake or stream at low water mark. When it borders upon other water than a navigable water the owner takes to the middle of the stream. When it borders upon tide water he takes to the ordinary high water mark. Consequently as to any wood growing above the low water mark the owner would be entitled to such wood and to keep parties off from his land.

### Fencing Property

I have built all of my share of the fence around my land, but an adjoining owner who runs sheep refuses to do any fencing. Can he be made to fence his share?—Subscriber, San Ardo.

The law does not afford any means whereby an adjoining owner can be compelled to fence. The sole provision is that a party who does fence his land can recover from the other, if he afterwards makes use of it, a just proportion of the value at that time of any division fence which the first owner made. Of course, if you do not intend to fence you propably could not recover for trespassing sheep or cattle unless you are located within one of the counties having special statutes applicable to them.

### Retaining Rights to Oil

Some years ago a deed was made for land which did not contain any clause reserving an oil right. To whom does the right belong? If necessary to have any provision concerning this right what steps are necessary?—Subscriber, El Monte.

The deed transferred to the grantee all of the actual title to the thing transferred which the transferrer has at the time of the transfer unless a definite intention was expressed or implied, that is to say, it transferred the whole property from the center of the earth to the sky, together with all contents such as oil, water or other minerals. It doubtless would be a very difficult thing for the grantor to show any intention of reservation at this time. If there is any desire so to do it would probably be necessary to consult your local attorney as to what action could be taken. The grantee needs no further provision than the original deed.

### Verbal Agreement Invalid

Some years ago a realty broker agreed to sell certain land to me upon a cash payment and the balance within a year from that date. He agreed that he would sell the land before the last payment fell due. This agreement was made verbally before witnesses. The first payment was made but he now says that he cannot sell the land. What can be done?—Subscriber, Porterville.

There are certain things that require writing in order to make them valid. One of these is an agreement which by its terms is not to be performed within a year from the making thereof. The second is an agreement for the sale of real property or of an interest therein. The third is an agreement authorizing or employing an agent or broker to purchase or sell real estate for compensation or a commission. It would seem from the question that this matter would fall within one of those three clauses and, therefore, the only thing that the purchaser could do would be to continue to make his payments and purchase the land. It might be that upon a more thorough investigation of the question some method of avoiding this statue of frauds, as it is termed, might be devised, so that an action could lie for mistake, fraud or some matter such as that.

### Trespassing Chickens

A neighbor adjoining my vineyard has a flock of turkeys and chickens which continually eat my grapes and scratch up the vines. He doesn't seem to care although I have spoken to him. What steps could be taken to stop the trespassing?—Subscriber, Lankershim.

This is a comparatively similar question to one heretofore stated. The legal method pointed out is for the land owner to take up the trespassing turkeys and chickens as estrays and

H. P. Rigid Rail Tracks on a Fordson

# When and Where to See Them—

**H. P. Rigid Rail Tracks** and **H. P. "40" Tractors** have an interesting story of accomplishment of which every farmer on the Pacific Coast should listen and profit by doing so.

**H. P. Rigid Rail Tracks** solve the small tractor problem by giving increased efficiency to the Fordson, while **H. P. "40" Tractors** embody the same, successful rigid rail track principle in a tractor of larger size.

**Both will be exhibited in the various County Fairs as follows:**

**Butte County Fair at Oroville, Oct. 2nd to 7th.**
**Kern County Fair at Bakersfield, Oct. 2nd to 7th.**
**Ventura County Fair at Ventura, Oct. 3rd to 8th.**
**Riverside County Fair at Riverside, Oct. 10th to 15th.**

If you cannot attend any of the County Fairs to see them, write us for literature.

**Pacific Tractor & Machinery Co.**

H. P. "40"

hold them under the estray act. He is entitled not to exceed 15 cents per day for the keeping and care of each of the birds taken, together with the other costs incident to the estray act. Probably if the fowls are taken under this act once or twice it may be sufficient to cause their owner to take measures to restrain them.

### Overdue Rent

I rented a furnished house from month to month. The tenants are in arrears in their rent some two or three months. What notice do I have to give to require them to vacate. Can I hold any personal belongings or furniture for rent. Can a garnishment be made upon the man's wages?—Subscriber, Hemet.

A three day notice to pay up delinquent rents or remove from the premises would in this case be sufficient as the parties are more than a month in arrears with their rent. Their furniture and clothing is exempt from execution, but as any action which you would take for collection would be one for the common necessaries of life you would be entitled to levy attachment or execution upon the wages of the defendant and one-half of such earnings rendered at any time in 30 days next preceding the levy of the attachment is subject to execution or attachment. All of the wages earned more than 30 days prior to the levy is subject to the execution.

# Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

### Spray for Mosquitoes

Would you kindly inform me in your next issue of the Cultivator the best spray for mosquitoes around outdoor buildings and plants?—Subscriber, Anaheim.

We take it our subscriber is inquiring for an oil for spreading on the surface of stagnant pools where the mosquitoes breed. The best control is secured by the use of ordinary kerosene but a few drops to a spoonful being sufficient to cover say a few yards or a square rod of water surface. In addition give thorough drainage to all pools where water remains standing. Old cans, tubs and buckets sometimes holding water are the cause of a mosquito pest. Where mosquitoes are already bad the burning of punk, incense or any material which causes a dense smoke gives relief.

### Blackberries Trespassing

Blackberry plants are rooted five feet from property line. Neighbor claims damages from runners dropping on his land and taking root.—Subscriber.

This seems to be the case of altogether too neighborly blackberries. These plants certainly should not create a condition serious enough to cause neighborly illfeeling. A turn or two with the cultivator, together with a bit of pruning back of the vigorous growing plants would probably result in an increased crop for the owner of the plants.

### Septic Tank

Where can I get information as to how to make a septic tank?—Subscriber, El Monte.

See page 409 of the Cultivator of April 15, 1922. Had the inquirer sent his name we would have been glad to have mailed him a copy.

### Drying Prunes

Would you please answer me through the Cultivator what process do you have to put prunes through before you pack them? How long do you keep them in the solution and how hot does it have to be?—Subscriber, Gridley.

See Mr. Barnard's article in the Cultivator of August 19, page 171.

### Tomatoes Rot

Would you kindly tell me what I might do to save my tomato crop? The green tomatoes are large and firm, but as soon as they start to ripen a brown rot spot developes in them.—Subscriber, Petaluma.

This is probably a fungus disease and the only remedy we know of is to train the vines up on the ground and thin them out so that they will get as much sunlight and ventilation as possible. The use of sprays or fungicides is not advisable on tomatoes.

### Storing Sweet Potatoes

Can you tell me it there is any way of keeping sweet potatoes other than packing in dry sand? I am a small farmer, and would be grateful for some less laborious way.—Subscriber, Chino.

Dry sand is one of the best materials to use for the storage of sweet potatoes. Straw makes a good packing material provided the potatoes can be stored in a dry place in bins that can be ventilated and where a fairly uniform temperature can be maintained. In order to be assured any degree of success in keeping sweet potatoes they must be handled with extreme care from the time they are dug to prevent bruising or breaking the skin.

### Making the Slicker Less of a Sticker

Can you give me a formula or recipe than can be applied to a black gum coat or slicker that will stop it from sticking together? It sticks to anything it comes in contact with except water.—Subscriber, Los Angeles.

It is difficult to recommend anything to prevent a gum coat from sticking that would not have a detrimental effect on its waterproof qualities. A liberal application of talcum powder might have the desired result and would probably not injure the gum. The ladies put away their bathing caps with a coating of talcum powder to prevent the rubber from sticking together. We see no reason why the same process should not work with the slicker.

### Gypsum on Alkali Soil

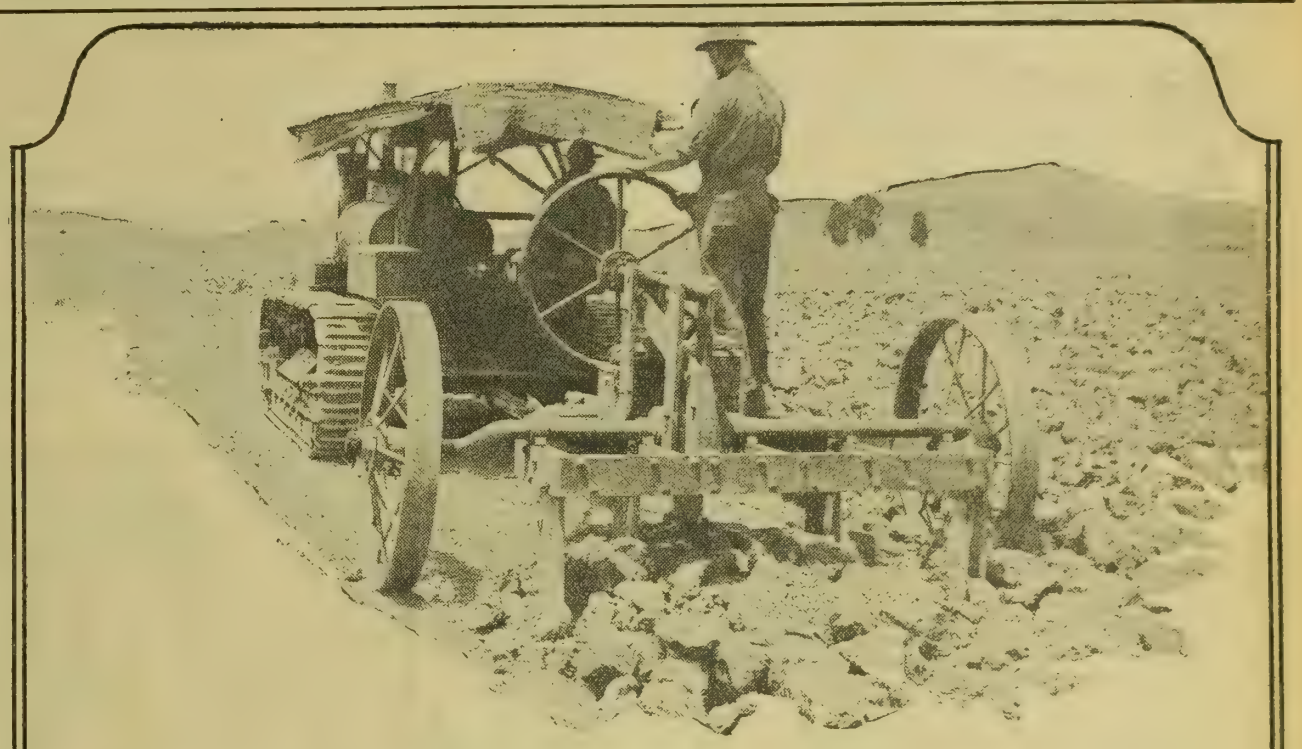
My land, which is planted to grapes, shows black alkali in spots. Unless cultivated deeply immediately after being irrigated it will cement together. Will lime help this ground and if so where can I get the lime at a reasonable price?—Subscriber, Delano.

As a corrective of black alkali conditions gypsum would be better. Make application of 1000 pounds or even a ton to the acre. This will change the black alkali or sodium carbonate to white alkali or sodium sulphate. This in turn may be partially removed from the soil by heavy irrigations, especially if it is possible to underdrain. For best results it is necessary to continue heavy irrigations and keep soil in moist condition.

### Value of Rabbit Manure

Will you kindly give me the relative value of rabbit manure compared with other manures? This manure is from self cleaning hutches and contains practically no urine. What elements should be applied with it to make it an ideal fertilizer for strawberries and raspberries? Would a mulch of green manure with alfalfa hay wastage make a good mulch during the winter?—Subscriber, Santa Barbara.

Under the conditions stated I think its value would be about the same as sheep manure. Would suggest using the alfalfa hay only as a mulch during the winter and applying the rabbit manure early in the spring, working it into the soil so that it will immediately become available to the plants. We are unable to find analysis of rabbit manure.



# Subsoiling Improves Crops

By shattering the hardened strata of earth, the hard-pans and plow-pans, the air and water get deep down into the soil. New soil resources are unlocked, bacterial action begins to work the soil into plant food; the little feeder roots reach out and draw the plant food in.

New orchard and vineyard land should be thoroughly subsoiled before planting. Successful growers are securing improved crops in old orchards and vineyards by subsoiling.

POWER is the key to modern soil culture. The Best "Sixty" handles the big 5-standard subsoiler and the combined equipment of large farming operations. The Best "Thirty" is adapted to the deep tillage demands of the smaller farm, orchard and vineyard.

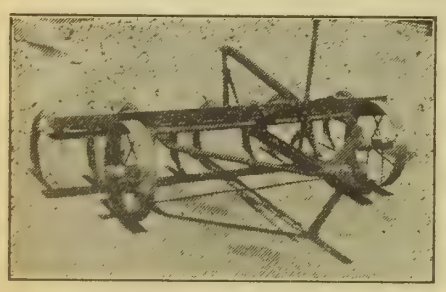
## HURLEYS NEW GOOSE NECK Cultivator

**The Best Furrowing and Leveling Machine on the Market—Built for Horses, also Largest and Smallest Tractors.**



This is the lightest weight efficient Cultivator and Furrower on the market. Its construction of spring steel gives it a crossbar that yields to sudden strains and it springs back. Detach the shovels and wheels and you have THE BEST LEVELER YOU CAN BUY.

Patented reinforced spring steel drawbar 5 in. x ⅝ in. with bar below 5 in. x ⅜ in. reinforced on two edges with angle iron. Shanks diamond shape 1¼ or 1⅛ in. Hitches for all tractors or horses. 6 ft. size only $110 with 1¼ in. shanks. 6 ft. with 1⅛ in. shanks $105. Made in 6, 7 and 8 ft. sizes. Horse drawn cultivator has front truck. Over 300 in use and all giving best of satisfaction. Order direct.

You can go any depth from 5 in. above the ground to 15 in. deep, setting the teeth to prevent cutting the roots.

ONE OF ORANGE COUNTY'S PROMINENT CITRUS GROWERS WRITES:

M. H. Hurley, Whittier. Anaheim, July 18, 1922.

I want to express my appreciation of the work done by your Gooseneck Cultivator. I had a crusty soil condition in one part of my grove that other cultivators would not handle but your Gooseneck Cultivator went right into it, ripped it up and all the ground now permits water to enter easily, gives air to the roots and the trees that were showing signs of trouble before are healthy and doing fine. It was the cultivating that did it.

### A REULAR PRAYER

Lord, let me live like a Regular Man,
With Regular friends and true;
Let me play the game on a Regular plan
And play that way all through;
Let me win or lose with a Regular smile
And never be known to whine,
For that is a "Regular Fellow's" style
And I want to make it mine.

Oh, give me a Regular chance in life,
The same as the rest, I pray,
And give me a Regular girl for wife
To help me along the way;
Let us know the lot of humanity,
Regular woes and joys,
And raise a Regular family
Of Regular girls and boys!

Let me live to a Regular good old age,
With Regular snow-white hair,
Having done my labor and earned my wage,
And played my game for fair;
And so at last when the people scan,
My face on its peaceful bier,
They'll say "Well, he was a Regular Man!"
And drop a Regular tear!—Author Unknown.

All the Convenience of City Gas

Housewives everywhere can, now, enjoy the clean, safe fuel, and comfort, heretofore considered as an exclusive city convenience. Coleman Cookers light with matches and make their own gas from common motor gasoline. No wicks, no cones, no chimneys.

### SING HI, COOK

By Clara Peterson

SING HI lived in Honolulu until he was 12 years old. Because he had no home he learned almost as soon as he could walk how to take care of himself. Kind people fed him what was left in their dishes, bits of sweet potato and baked banana, morsels of nut paste and sometimes even a slice of little roasting pig which Sing Hi would remember for days afterward. It wasn't long before Sing Hi himself could climb the coconut trees growing near the beach. Then as easily as a monkey he would reach up and pick the ripest coconuts to fill his tiny stomach.

When he was ten Sing Hi went to work in the kitchen of a great hotel on the shore. He helped the cook. He learned how to stuff fish and how to pound kukui nuts for seasoning, but he learned also how to cook things the Americans liked—roast beef and mashed potatoes, apple dumplings and lemon pie.

Because Sing Hi had such a bright little yellow face and such beautiful slanting eyes the ladies who came to the hotel, and the men too, were very kind to him when he could get out of the kitchen, and Sing Hi learned to read and to know things about every country in the world. There was only one country, however, that he really wanted to see, and that was China, for Sing Hi could never forget that he was a Chinese boy.

In the spring when the poinciana trees covered themselves with crimson flowers like big red umbrellas, and all the streets were lined with blossoms, Sing Hi would look about him as he trotted along and say, "It must be lovelier than this in China."

When he walked through the parks and saw little lakes filled with water liies of pink and lavender, and islands where palms and oleanders grew, Sing Hi would say again, "It must be lovelier than this in China."

One day a boat from China came to Honolulu. All day the quiet Chinese sailors unloaded bales of silk and china dishes. Sing Hi forgot his work at the hotel. He forgot everything except sitting as near to the busy pier as he could get and watching with wide open eyes the scurrying sailors. Some of them even nodded kindly to Sing Hi. He did not know that he looked far handsomer and happier than most Chinese children in his flowered coat and trousers with the big yellow sash. His pointed hat, like a very broad ice cream cone, sat jauntily on his little black head.

The next evening when the Chinese boat sailed out of the harbor Sing Hi was in it. He was going back to China and he had promised to do all the dishes to pay for his passage. He had only the clothes he wore, but in a dark corner of the boat he piled the books he had brought—a geography, The Water Babies, Robinson Crusoe and an American cook book.

But somehow the great thronging Chinese city where they landed was a disappointment to Sing Hi. He left the boat with his books in his arms, saying goodby very carefully to the cook and all the sailors. It seemed to him that there were a million people at the waterfront; hungry, tired, wrinkled yellow faces. Sugar was being unloaded from the ship that had carried Sing Hi, and the moment the last sack had left the deck hundreds of Chinese women crowded toward the boat to scrape from its deck and from the gang plank the precious grains of sugar that had spilled.

He walked aimlessly through the narrow streets. They were lined with crates and baskets. The shopkeepers seemed to be pushing their stores into the road. At every turn Sing Hi was crowded against a wall or a workbench where ivory carvers and workers in wav moved their yellow fingers deftly and did not look up. He found himself wishing that everything was not blue. Men and women both wore cotton robes, all of the same deep blue, though now and then the street would clear suddenly and into sight would come a mandarin in his green sedan chair, holding his head proudly above his stiff, embroidered gown.

"I shall walk into the country," said little Sing Hi. "There surely I shall get away from poverty and hurry. There I shall find great trees and lovely rippling streams, and perhaps I shall gather berries for my lunch.

For several days Sing Hi wandered in the country. He slept at night along the highway and shivered in his thin clothes. But he looked in vain for woods and brooks and flowered hills. Everything was yellow, the ground and the little rivers. Sometimes he would think that he had found a flower and would stoop to pick it, only to find that it was a leaf covered more thickly with yellow dust than the others. There were many granite boulders and often not a tree to be seen, but everywhere people were living. He saw them in tiny huts with sagging roofs. The women with bound feet stayed indoors. The others worked with the men in the fields, forever bending over their small pieces of ground which must be made to feed so many.

The ship's captain had given Sing Hi 20 brass cash when they parted and with it he bought food from peddlers along the high road—a bit of melon, strips of fish tied together with grass blades, a few peanuts. Sing Hi found himself longing for the coconut trees of Honolulu.

Now and then he came to temples which he did not dare approach closely. They were beautiful because they always had trees around them. Their scalloped roofs shone in the sun and sometimes the sound of drums and cymbals came from them.

When Sing Hi's money was gone he found no one he could ask for help; all he met were poorer than himself. On the third day when night was coming Sing Hi wiped the tears from his eyes. He was tired and hungry and even his four books seemed too heavy to carry.

Where the river wound around a yellow cliff Sing Hi followed wearily. He walked several paces without lifting his eyes. Then he stopped and stared across the river. He saw what seemed to be a park enclosed by a high stone wall. There was a scarlet pointed tower at each of the four corners of the wall and cedar trees waved their branches within. Built into the wall straight across was a gate of stone, carved until it was frail and lacy looking. The gate swung open and out of it had just come a Chinese boy of Sing Hi's age. Sing Hi could see the setting sun sparkling on the golden dragons in the boy's jacket. It sparkled too on a tree loaded with peaches in the garden behind him.

As Sing Hi gazed the boy put up his arm timidly and motioned with his right hand. Sing Hi stepped into the river and waded toward him. When the river became too deep he held his precious books above the water and swam with one hand for he could swim like an eel, having often dived for pennies from the hotel pier.

When at last Sing Hi found himself before the boy he felt strangely bashful. They stood staring at each other but Sing Hi was conscious too of the peaches glimmering behind them for he was very hungry.

"My name is Chang Low," said the boy gravely. "My honorable father is the great mandarin of this district. From the tower I saw you circling the river. What is your name and where are you from?"

"My name is Sing Hi and I have traveled across the ocean. I am hungry. Would your honorable father allow me to work for him and to sup in the kitchen?"

The boy shook his head although his eyes sparkled at the thought.

"My honorable father is very angry. Someone has stolen his great great-grandfather's ring of jade. He has offered 100 taels for its return."

"I do not know where to search for the ring," said Sing Hi, slowly. "But I can cook, most wonderfully can I cook." He looked again at the peaches.

Chang Low clapped his hands together and nodded his head so that his black pigtail swung up and down.

He picked the lowest peach and handed it to Sing Hi.

"Our servant, Ming, has need of someone to help him. Wait, I shall ask."

So it happened that Sing Hi went into the mandarin's kitchen. For five days he worked faithfully; he dressed the fowls and peeled the vegetables, he sorted the rice and the beans, he stirred whatever Ming put to bubble in the iron pot on the stove. Sometimes through the arch when the thin door swung open Sing Hi would see the mandarin and his son seated at dinner. There were curtains of sky blue silk with green and orange storks embroidered on them. There were thick rugs that looked like blue and lavender satin and there were incense burners which were idols with strange and hideous faces.

Always, whether the door was open or shut Sing Hi could hear the mandarin grumbling about his ring. He was glad that Chang Low's honorable father had never seen him, did not know about the new kitchen helper, for somehow Sing Hi was afraid of the mandarin. He did not want to leave this new home for when the kitchen work was done he and Chang Low spent happy hours under the cedars. Sing Hi told of all his adventures and was starting very slowly to read the books to Chang Low. When they were tired of that they fished in the yellow river or swam lazily in the pool hidden among the trees.

Then Ming fell ill and Sing Hi promised to take his place. Yes, he could cook most wonderfully! Ming hobbled to a missionary doctor and left Sing Hi in the kitchen. He looked around joyfully. Now he would prepare the finest dinner the mandarin had ever tasted—roast pork and apple sauce, new peas in cream, mashed potatoes with rich brown gravy, custard pie as high as one's finger.

Sing Hi was flushed with delight as one by one at dinner time he sent in the delicious dishes. The little house boy who attended the dining room trotted back and forth through the swinging door, grinning proudly, too. Never in all his life had he seen such queer things to eat.

That afternoon when the kitchen was as clean as scouring could make it Sing Hi ran happily to the pool where Chang Low was to meet him. The mandarin's son was weeping.

"My father is very angry. He has not found his jade ring and he is afraid that bad luck will come to him. Also at dinner he was disturbed. He was called away as we finished dining or he would have gone to the kitchen to speak to Ming. Then he would have seen you. He stared at those strange foods and at first was afraid to touch them. Then he ate them all and smacked his lips, though he frowned. Ah, Sing Hi, those are not Chinese foods. Are those all you can prepare? My father will send you away. What shall we do?"

Sing Hi brought the American cook book from under the head of his mat and studied it feverishly. What, what could he give the mandarin for supper! The two boys bent over the book for an hour, sadly forgetting to play. Then Sing Hi arose and hurried into the house.

That night the mandarin came wearily home. The jade ring of his fathers had not been found. The police had caught a thief who wore such a ring but it was no more like the mandarin's than a star is like the sun.

The house boy placed before the mandarin a bowl of steaming soup. Ah, such fragrance—the breath of herbs, the smell of juicy beef and lean white veal!

The mandarin dipped his spoon into the broth. He bent over the bowl and his mouth fell open with surprise, for there among the cubes of meat were long, soaked pieces of straw and grass. Sing Hi, sugaring apricots in the kitchen, felt himself lifted by the collar and hurried into the dining room.

"What mess is this, and who are you?" shouted the mandarin angrily.

Sing Hi looked unhappily at the bowl with the straw hanging over its edge. He felt Chang Low gazing sadly at him.

"Honorable sir, your servant Ming is ill and I take his place. I cook American foods, and those you do not like. At the hotel where I used to live I heard often that Chinese ate bird's nest soup. In my cook book I found a soup recipe. Then when the meat grew tender and the herbs were added I brought from a tree top the inside of a crow's nest. Into the kettle I stirred it that the soup might become Chinese."

The mandarin was sitting again before the soup and he spoke quite angrily, though his eyes twinkled, as he lifted a spoonful of the liquid.

"Bird's nest soup is indeed a delicacy. But it is not made of crows' nests—Bah—The nests of cliff birds—"

The mandarin stopped talking and bent over his spoon in amazement. Sing Hi and Chang Low and even the house boy crowded forward, for in the bowl of the spoon lay the jade ring!

After that the mandarin often told his friends the story and pointed proudly to his son and Sing Hi studying together. Sometimes the crow walked around on the grass beside the boys as though looking for another ring to steal. Whenever he found anything that glittered, though it was no more than a piece of glass, he would caw loudly and fly away with it, for he had a new hiding place.

Of course Sing Hi got the reward, which made him very rich indeed, and when he and Chang Low grew older they went to the university together.

## MARSHMALLOWS

Here is marshmallow recipe called for: One box of Jell-O should be soaked in 12 tablespoons cold water while cooking four large cups sugar in one cup water. Cook syrup till it spins a very fine thread and pour on the gelatine, beating constantly. Beat for half hour at least, as this is what makes them tender. Have ready plates or pans dusted with powdered sugar and leave plenty of powdered sugar on top of marshmallows to prevent crust forming. Use any kind of flavor desired, adding it during the beating process. I usually add coloring to part, for variety. Another change is to cut the marshmallows and roll in ground nuts instead of powdered sugar. Cut in squares when cold.—Mrs. Brown, Bakersfield.

### NOT ALWAYS A SIGN

As usual, Mrs. Subbubs enlivened the dinner table conversation with an account of the new servant.

"I don't know much about her yet," she said, "but she is good-natured and harmless, at any rate."

"How did you find that out?"

"By her singing. She is always singing at her work."

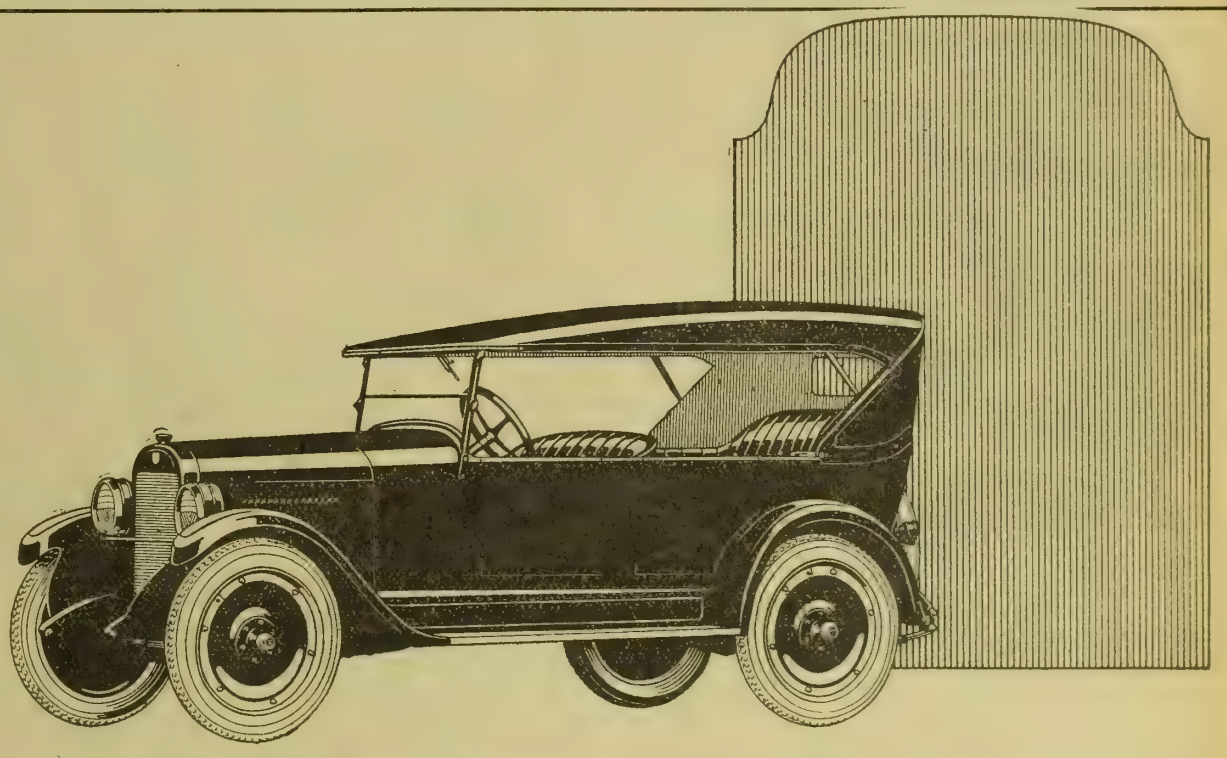
"That's no sign," said Mr. Subbubs. "A mosquito does that."

## Oil Light Beats Electric or Gas

### BURNS 94% AIR

A new oil lamp that gives an amazingly brilliant, soft, white light, even better than gas or electricity, has been tested by the U. S. government and 35 leading universities and found to be superior to 10 ordinary oil lamps. It burns without odor, smoke or noise—no pumping up, is simple, clean, safe. Burns 94% air and 6% common kerosene (coal oil).

The inventor, W. V. Johnson, 31 N. Fifth St., Portland, Ore., is offering to send a lamp on 10 days' FREE trial, or even to give one FREE to the first user in each locality who will help him introduce it. Write him today for full particulars. Also ask him to explain how you can get the agency, and without experience or money make $250 to $500 per month.



Such value as you will not find elsewhere—value that expresses itself in a new kind of beauty, in all-satisfying performance, in savings that make a motor car worth while on the farm.

Cord tires, non-skid front and rear; disc steel wheels, demountable at rim and at hub; drum type lamps; Alemite lubrication; motor-driven electric horn; unusually long springs; deep, wide, roomy seats; real leather upholstery in open cars, broadcloth in closed cars; open car side-curtains open with doors; clutch and brake action, steering and gear shifting, remarkably easy; new type water-tight windshield. Touring Car, $885; Roadster, $885; Sedan, $1335; Coupe, $1235. Prices F. O. B. Detroit, revenue tax to be added.

# Good Livestock at San Diego

By Jack Klein

FOR the fourth time the San Diego County folks came forward in a quiet way and and put on their county fair under the auspices of the farm bureau. Starting in a small way this show has grown until it ranks with all the other fairs of the state.

Beautiful Balboa Park, which was the scene of the exposition in 1915, is the location of the fair and it is a most wonderful situation. Many of the exposition buildings are of the permanent type and they are particularly well suited to show purposes.

The farm centers were all active and prepared beautiful exhibits which were judged by Ernest Braunton, Wm. Hertrich and Geo. P. Weldon. Escondido was the winner with Japatul and El Cajon close competitors.

The livestock department showed a decided increase over previous years and the quality was fine.

Being more or less of a range county the interest in horses is still great and there were many beautiful animals ridden by skilled horsemen to keep the crowds amused. Some very good purebred draft horses were also shown by John S. Hull of Nestor and Winsor Ranch. The fair is for San Diego County entries only, and this tends to produce a greater rivalry between the small breeders of the county than if the classes were open to all comers. This helps to make the fair one of great interest to the local people.

The Holstein show was small with Claude L. Weston of Mission Valley showing the grand champion bull and Jas. Ballantyne of Santee exhibiting the champion cow.

In the Jerseys Winsor Ranch of Bonita exhibited a long string and won all the female classes and champion cow as well as a number of firsts in the males. A. P. McComas of Ramona won the champion bull.

The Guernseys outnumbered all other breeds and four first class herds were shown. G. T. Drinkwater of Lakeside won firsts and grand champion cow; F. B. Naylor of San Diego was next and C. R. Grice of Santee and Russell S. Cox of San Marcos were also generally in the running. Cox had the honor of showing the grand champion bull. Most of these animals will be shown at Riverside and Pomona against the best herds of the state.

The beef cattle were limited to a small herd of Herefords shown by D. H. Ogden of Alpine.

# Showing Calves in the Ring

By Fred E. Klussendorf

Assuming that the animal you are to show has been selected with all the skill at your command; that it is an animal showing constitution and capacity; that it conforms as far as possible to the highest standards of breed type; that it shows all the indications of production and dairy temperament and quality; that it has been properly fitted; that you have led and posed it every day for a long time and that all these things have been done faithfully and well, you are ready to lead it into the ring.

Have a neat looking halter on the calf. It need not be an expensive one but should fit well and be of good appearance. Don't have a rope on it big enough to tie an elephant nor have fringes hanging all around, but let it be clean and neat.

Have your calf or older animal so trained that it will walk into the ring with head up and without any pulling and hauling. Take your place in the line and keep a space of at least three feet between your animal and the next.

### In The Ring

Now remember that for the length of time your animal is in the ring your whole attention should be given to that animal and to the judge. Do not let your attention be drawn from your work in the ring. This means no visiting with Johnnie Jones; no looking over the crowd to see if they are all watching you. You must be entirely occupied with seeing that your animal is standing squarely on its feet; that you keep it properly posed at all times. Above everything, at this particular point, do not allow it to stretch itself after the manner of a saddle horse—as so many the past year seemed inclined to do. Some believe that this may cover up a sloping rump, but it never deceives the judge, and it usually brings out other faults.

As the judge comes down the ring toward you stand on the opposite side from him so that he may see at a glance the top line, length and depth of body, and the entire general outline of your animal. After he has passed you quietly step to the other side—always remembering that your animal, yourself and the judge are the only things to be considered by you while in the ring.

When the judge walks up to you to examine your animal, be sure to stand on the opposite side, and, as he feels of the hide, allow the head of your calf to very slightly turn toward him. This will enable him to take hold of it more easily and determine its softness and quality. He will now examine for veining and milk-well openings, for ribbing and openness of vertebrae; in females, for placing of teats, attachment and quality of udder; in males, for placing of rudimentaries and how well cut out behind; also for length and levelness of hip. As he walks to the head of your animal to examine that and to better observe the spring of fore rib and depth of chest, stand slightly to one side. Your calf should be so well trained that you will be able to do this without the animal moving from position.

Be courteous to the judge and superintendent or other persons in charge. Do as you are told by them, and, should you leave the ring without a ribbon, do not go away discouraged but with a determination to get the blue next time. Find out where your faults were and correct them.

After the ribbons are given out, if you have any question that you would like to ask the judge, do not hesitate to do so. The entire purpose of the show ring is to teach us, as breeders of dairy animals, what are the essentials of a really high class animal. The fact that you may fool the judge temporarily does not help the breed or the person showing. It is as much to your interest to know what are the faults of your animals as it is to know whether you are first or last. Whether Ted Smith wins or Johnnie Jones wins is not the most important point. But it is absolutely vital that the proper animals shall be placed at the top, in order that you boys and breeders may study and take home with you in your minds just what constitutes an animal of the best conformation.

## CALIFORNIA JERSEY BREEDERS ANNUAL

California Jersey Breeders held their regular annual meeting during the state fair, Tuesday evening, September 5. It was a large and enthusiastic meet, there being about 60 breeders present. The item first on the program was the election of officers, and the following were elected for the ensuing two years: President, J. W. Coppini, Ferndale; vice president, Grant A. Brown, El Monte; secretary, W. E. Foley, Ferndale; treasurer, J. H. Sawyer, Lockeford.

Several matters of business came up, among them being motion authorizing

**Their Spring Stretch Never Dies**
That's Why
Nu-Way Strech
Rubberless Suspenders, Garters and Hose Supporters give easy comfort and long wear.
No rubber to rot; Phosphor Bronze Rustless Springs give lots of stretch. Suspenders have easy slip-loop back. Nickel trim, 50c; satin brass trim, 75c. Men's Wide Web Garters—no metal can touch the leg—50c.
Ladies' and Misses' Hose Supporters and Corset Sew-Ons. Lasting stretch and no troublesome garter-runs—25c.
Children's Hose Supporter Harness. Easy on stockings and give long wear. Only 50c.
A YEAR'S WEAR GUARANTEED
ASK YOUR DEALER. If he hasn't them, send direct, giving dealer's name. Insist on Nu-Ways. Accept no substitute. Guarantee label on every pair. Ask for story of Nu-Way Stretch
Nu-Way Strech Suspender Co.

Edeson Phone Co. 6 Beach St. Dept. F-38 Boston Mass.

the treasurer to draw a check for $20 as a contribution to the school essay fund in connection with the purebred sire campaign in Marin and Sonoma Counties this fall. It was also decided to offer a trophy for breeders young herd at California Annual Livestock Show to be held in San Francisco next month; also to give a cup as prize to the school team standing first in the judging of Jerseys during the convention of the boys and girls agriculture club winners next month.

Talks were made by Frank B. Astroth, field agent of the American Jersey Cattle Club, and Dr. C. L. Roadhouse, University Farm, Davis, and Prof. P. M. Brandt who judged the Jerseys.

The Jerseys had by far the largest show of any dairy breed at the California state fair this year, there being exhibited 193 animals in all.

### STATE FAIR BUTTER AND CHEESE CONTEST

Creamery Butter—1, Jackson Creamery Co., Jackson, 94; 2, A. Wirtz, Hollister, 93¾; 3, Chas. A. Holm, Salinas, 93½.

Display Dairy Products—1, Northern California Milk Producers Association, Sacramento; 2, Associated Milk Producers, Holt; 3, Northern California Counties Association, Redding. (There were four entries in this class.)

Best Display Milk Powder and Condensed Milk—Northern California Milk Producers Association, Sacramento, highest award, gold medal.

### WAKE UP! SWINE BREEDERS

**By Bruce S. Bennett**

From present indication and all outward signs the swine breeders of California have not awakened to the possibilities presented to them. Sales of dairy cattle the past six months show a strong demand for good animals. Swine sales held last January and February indicated a good market for purebred swine at very satisfactory prices. When a breeder can realize two to three times the price of pork for bred gilts it affords a margin of profit that should in every way be satisfactory to both buyer and seller.

### COW TESTING

The Kern County Cow Testing Association reports through Tester Rousseau number of cows tested for the month, 877; average pounds milk per cof, 702.4; average pounds fat per cow, 26.6. 79 cows produced more than 40 pounds fat during the month. The three best cows of the month were owned by A. R. Buttles, H. G. Hull and C. P. Morgan. Mr. Buttles' cow produced 74 pounds fat. The two highest herd averages were made by the dairies of C. P. Morgan, 36.9 pounds fat and A. V. Bennett, 36.2 pounds fat.

# Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

### Fresh Cow—Little Milk

We have a fresh cow that is giving only a quart or two at a milking. Before we turned her dry she was giving a gallon and a half a day and could scarcely dry her up. She was dry about six weeks before calving. About two weeks before she calved she began to make bag and then it seemed to disappear and when she came fresh there was scarcely any milk at all. She is apparently healthy and all right and the calf seems to be perfect. The milk is good. What is the trouble and what can we do for her?—Subscriber, Bakersfield.

Something must be wrong with the feed or water. Give her sloppy feed and green alfalfa or corn fodder if you can get it. Mix three pounds of opsom salts and two pounds of common salt and give her a handful of it once a day in the feed. That will thin the blood and may start a greater flow of milk.

### Poor Sow

I have a brood sow that will have a litter in about a month and she is very poor. She has been feeding in a barley field with a little alfalfa. Other sows on the same feed are in good shape. Can you tell me a tonic that will put her in good shape?—Subscriber, Live Oak.

Any one of many things might be wrong with her. The others may annoy her or the trouble may be in the mouth with the teeth. Better separate her from the rest, feed her liberally and watch her to find out what is wrong with her. Hogs need very little medicine. Give her sour milk with some corn meal in it. May be a little baking soda will help some.

### Discharge from Nostrils

I have had a good, eight year old cow for over two years and she is doing fine; eats well and gives a fine amount of milk. She was tested for tuberculosis last winter and was all right. Lately for a month she has had a discharge from her nostrils. I noticed it once before last summer or winter. She acts as if she had a cold. What can I do for it?—Subscriber, Sebastopol.

It may be due to a loose tooth in the upper jaw. If there is such it should be removed. Or she may have coughed and forced some feed up into her nostrils from the back passages. That would be hard to reach. If you can not find anything wrong give her a teaspoon of sulphate of iron in a little feed once a day.

### Heifer Sucking Cow

I have a heifer, seven months old, sucking cow. I took the heifer from the cow when three days old, kept her separate for a couple of weeks and then turned her in with the rest of the stock using one of the baskets to keep her from sucking. Everything went well until the basket got caught in the brush and was pulled off and the calf commenced to suck the cow the same day. She was about two months old at that time. I have used everything I know of since to break her but have been unable to do so. Have used a different kind of basket and also one of the prods used by the cattlemen around here but in some way or another she manages to twist the thing around and get to the bag. Kindly advise me through the Cultivator if there is a way to break her.—Subscriber, Arroyo Grande.

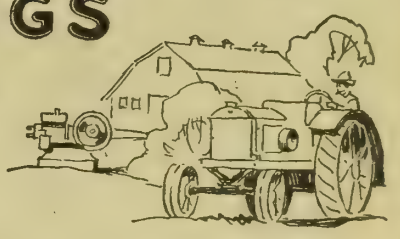
It seems that you have tried about every known means. About the only remedy left is to separate her from all other cattle. Some get the habit and seem to be incurable.

### PER HUNDRED

The farmers of the state are now ready to purchase animals at prices within reason, and it's up to the breeder as to whether or not this demand is supplied. In other states, in various sections, public sales of swine have been absorbed nearly in their entirety by farmers. There is no reason to doubt that the same conditions exist in California.

The depression of the past two years has cut deep into the ranks of state's swine breeders, but among all breeds there remains the nucleus for strong organization whose efforts can put the business back where it belongs. It is to be hoped that the coming season will see many public sales of purebred swine of all breeds, and it's strictly up to the breeders as to whether or not there are more hogs on the farms of the state.

McQUAY-NORRIS
PISTON RINGS
PISTONS
PINS



*They will cut down your Gas, Power and Transportation expense*

Your tractor, truck, engine or pump, and your automobile all depend upon the motor's piston rings, pistons and pins for economy and the machine's length of life. There is great waste in all of them when wear has taken place in these three vital units. And these parts wear faster in farm motors than they do in city-used motors, because of dusty roads and fields.

Dust works into the cylinders through the carburetor and mixes with the lubricating oil where it acts as an abrasive and produces more wear than happens in city automobiles that operate on paved streets. There is special need for farmers to overhaul their gasoline motors.

Thousands of added miles of car life and many added hours of power usefulness can be given most motors by renewing their piston rings, pistons and pins. The gas and oil saving will generally pay the expense of renewing them. They really need renewing just as much as tires do. There is this difference: you can see tire wear easily, but you cannot see piston ring, piston and pin wear. Power loss in the motor and an increase in gas and oil consumption tells you of it, however.

Sometimes only piston rings are required to restore these losses due to wear. There is a McQuay-Norris ring for every purpose and price—all made of Electric Iron.

If, however, the cylinders are worn enough to necessitate regrinding or reboring, then McQuay-Norris *Wainwright* Pistons and Pins are needed as well as McQuay-Norris Piston Rings. The McQuay-Norris line offers a complete renewal service for motor wear. Send for our Free Booklet, "To Have and to Hold Power," which explains the whole subject of motor wear and its correction. Address Dept. AB.

McQUAY-NORRIS MANUFACTURING COMPANY, ST. LOUIS, U. S. A.

**Pistons and Pins** McQuay-Norris *Wainwright* Pistons and Pins—gray iron pistons as light in weight as safety permits—specially designed for replacements—available in standard sizes and over-sizes—also in semi-finished form 75-thousandths over-size—pins of special hardened steel, ground to exceptional accuracy.

$1.25 Per ring. LEAK-PROOF—an exclusive two-piece design preventing loss of gas and compression. Gives equal pressure at all points on cylinder walls. For all piston grooves except top, which should have Superoyl. Each ring packed in a parchment container.

$1.00 Per ring. Superoyl—Keeps lubricating oil out of combustion chamber. Collects excess oil on each down stroke of piston and empties on each up stroke, which ordinary grooved rings cannot do. Each ring packed in a parchment container.

50c Per ring. *JIFFY-GRIP*—a one-piece ring. Non-butting joint, which can be fitted closer than ordinary step cut—velvet finish—quick seating. "Seats in a jiffy." To keep them clean and free from rust, each ring is packed in an individual glassine envelope.

**Snap Rings**—of the highest grade. Raised above the average by McQuay-Norris manufacturing methods. Their use insures all the satisfaction possible for you to get from a plain snap ring. They are packed twelve rings to the carton and rolled in waxed paper.

### WOOL GROWERS TO MEET

Secretary Wing writes that a meeting of interest to all wool growers will be held at the place of E. B. Hiatt, eight miles from Cloverdale on Friday, October 13, at 2 p. m. The following officers and directors of the California Wool Growers Association will be present: A. T. Spencer, director and chairman of the committee on transportation; George J. Cleary, director-manager of the Whitney Estate, Rocklin; Frank Bullard, treasurer, Woodland. There will also be present Dr. J. P. Iverson, chief, division of animal industry, state department of agriculture, Mr. Poole, in charge coyote control, United States biological survey, Professor James F. Wilson, sheep specialist, university farm, Davis; E. E. Kaufman, agricultural statistician, and F. A. Ellenwood, vice president National Wool Growers Association, if he returns from New York in time for the meeting.

Questions taken up will be: Coyote control, eradication of sheep diseases, possibility of forming a branch association of the California Wool Growers Association. Another meeting will be held at Eureka on October 10 and the same people will be present.

### THE HIGH SCHOOL JUDGING CONTEST

One of the interesting features of the California state fair was the high school judging contest which was held on Saturday, September 2. Twenty high schools competed on the five classes of livestock: horses, beef cattle, dairy cattle, sheep, swine.

Considerable interest was manifested in this contest by visitors and exhibitors. It is one of the educational features of the fair. The Esparto high school won the contest; Salinas high school was second and three high school students from Santa Cruz were third. They made the trip alone without a coach, and they are to be congratulated upon the fine showing that they made.

One of the high school instructors commenting upon the contest mentioned the fact that "the actual judging of livestock is only one of the significant features of the contest. One of the other important features is the training at home. In addition the contest affords an opportunity for instructors and students to get together—exchange ideas, and to receive inspiration." These students had been trained by various instructors, by going out into the country visiting herds and getting ideas from breeders in their own committees.

M. J. Warner, former principal of the Esparto High School, was superintendent of the contest, and B. H. Thomas, W. E. Tomson and E. H. Hughes were the judges.

## Livestock News Notes

**LIVESTOCK SALE CALENDAR**

October 26, C. W. Anderson, Burbank.
November 16, Dispersal, Arthur & Maxfield Holstein Co., Hanford.

Superintendent W. R. Harriman of the Los Angeles County farm reports records some of the county farm Holstein cows have been making. Jane Garden Pontiac De Kol as a junior two year old made 103.2 pounds of butter from 78,379.4 pounds of milk in 365 days. Princess Alcartra 2d, a senior two year old, made 540.6 pounds in 305 days, and Gerben Piebe Roderick 665.76 pounds also in 305 days. Burrm **Orndyke Vale at 30 months** o. age made 24.64 pounds butter from 438 pounds milk in 7 days and is milking over 60 pounds a day on year test.

"Ayrshire Milk Facts" is the title of a new booklet issued by the Ayrshire Breeders Association, Brandon, Vermont. This 16 page folder tells of the experience of several people in using Ayrshire milk in hospitals and public homes. The little lady on the title page is a product of a California Ayrshire farm. Copies of this booklet will be supplied breeders, doctors, mothers and others interested in the problem of securing better milk on application to the Brandon office.

A good many inquiries for Ayrshires were reported by the Ayrshire exhibitors at Sacramento. Mr. Starr of the H-G Ranch at Buellton reports the sale of three bull calves while Norabel sold the only one they had for sale. A good inquiry for females also developed. There is no question but that the man who shows his stock to the buying public at the fairs stands a better chance to sell than does the man who stays at home. Many fair visitors will buy for stock when they can pick it out of a show string. The moral is to show your stock even if you have only a few head of calves.

# Fall Chicks Make the Big Profits!

**We Can Deliver on October 5**

**500 White Leghorns at.....$15.00 per hundred**
**300 R. I. Reds at.....$19.00 per hundred**
**100 White Wyandottes at.....$22.50 per hundred**

Delivery charges paid in California, full oount guaranteed. This is all exceptionally fine stock from Purebred flocks kept on large range. We guarantee chicks to be purebred and true to type and color. This stock comes from our hatchery, Corner Vine and Hollenbeck streets, Covina. Phone Covina 375. These chicks are all hatched in the famous Chic-Elec Incubator made in Los Angeles which assures you a scientifically and perfectly hatched chick.

# Poultry Queries

(Conducted by Jean A. Koethen)

### Slobbers

What is good for slobbers in rabbits?—Subscriber, Chico.

Remove animal from others—rub alum (powdered) in mouth and on wet hair. Keep all food and water from animal for 10 or 12 hours and then feed sparingly for one or two days. Cause is indigestion from improper feed or a quick change in feeds.—W. D. W.

### Colds

Can you tell me what to do for rabbits with colds?—Subscriber, Chico.

If subscriber will tell what organs are affected, can prescribe direct remedies and manner of using remedy.—W. D. W.

### Pigeons

Please tell me where I can purchase pigeons for breeding stock for commercial purposes.—Subscriber, Porterville.

At present I know of no place where commercial pigeons can be bought in large quantities. The different pet stock dealers in Los Angeles or cities near to Porterville might have a few. At present, Mr. Hollender, of Hollender & Funk, Los Angeles, is secretary of the Pigeon Club, and might be able to make inquiries of club members who have the varieties wanted.—W. D. W.

### Sprouted Oats

Please outline the most approved methods for sprouting oats in quantities sufficient for 400 to 600 laying hens. How can mold be prevented?—Subscriber, San Gabriel.

I have never seen any exact statement as to the amount of grain which should be sprouted daily for 100 hens, but if we follow the method of feeding at the Santa Cruz egg laying contest, which sets aside one-fourth of the hard grain allowance for sprouting, of oats to be sprouted daily would be about 3 pounds or 6 quarts for each 100 hens. The oats are soaked for 24 hours in water which is a little warm (about 100 degrees) when it is put on the oats. To guard against mold, add 10 drops of formalin to a pail of soaking oats. After 24 hours pour the oats into the trays of a sprouting cabinet or into ordinary lug boxes with holes in the bottom for drainage, cover with burlap and moisten every 12 hours. The temperature should always be kept above 60 degrees; for this reason the sprouting cabinet is kept in a room that can be artificially warmed. The sprouting cabinet is a rack seven feet high and two feet square, the trays having a four inch marginal board and metal bottom. Many feeders begin to feed on the fifth day, when there are many little white sprouts, but no green. Others wait a little longer till the green shows. As a rule the hens like it best when the green is just beginning to show.

### Lame Goose

A goose nearly matured recovered from an attack of diarrhea only to lose the use of one leg, which is stiff. Can anything be done for her?—Subscriber, Simi.

You might paint the stiff joint two or three times a week with tincture of iodine. Keep her in a shady place and feed plenty of green feed. If she does not recover soon it might be best to eat her.

### Weak Legs

Some of our turkeys, four months old are getting weak legs. They have bone meal in their mash, but possibly not enough. Have had some trouble with feather picking.—Subscriber, Burbank.

A handful of bone meal to a gallon of mash should be ample. The trouble with your turkeys is not lack of bone meal. More likely they are not getting sufficient exercise. Turkeys four months old ought to do well on plain bran and rolled barley, with green feed and sour milk. Perhaps you are overfeeding, and the bodies are too heavy for their legs. If they are on alfalfa range they do not need a great deal of grain.

### OCTOBER, COAXING THE PULLETS

April pullets should begin laying in October, but they will not unless they have inherited the laying tendency—fecundity, experts call it—and have been well cared for through their six months of life. Pullets should not be forced for early maturity. On the contrary, they should be held back by a ration that is more fattening than forcing till they have developed the necessary frame and muscle. When they are ready to lay, however, at six months old or perhaps a little earlier, they should be given a ration which gives all materials for egg production and something more to stimulate the appetite. Cracked corn is an important part of the ration of pullets in their first season. A good laying mash always before them is another essential. Green feed is a sine qua non. Sour milk is a great help, and sprouted oats or barley stimulate the appetite. Here is a typical day's program: Morning, sprouted grain; 10 a. m., cut alfalfa in feeders, enough to last all day; 2 p. m., mash moistened with sour milk—just what the flock will clean up in 15 minutes; 4 or 4:30 p.m., mixed hard grain, preferably wheat, barley and corn, all they will eat, and a little for early morning.

### CULL FOR BREEDERS

Hens lay the majority of eggs during their first two laying seasons, and especially during their pullet year, if they are early hatched.

If a hen lays well during her pullet year she should be kept for another year as a breeder. The older she is and the more culling she survives the better, for then she has proved that she has the vitality to stand up under long continued laying and consequently is valuable as a breeder.

Dispose of all weak or deformed chicks as soon as they are hatched. Sell all weak, late hatched or undeveloped pullets. Keep all mature, vigorous, healthy pullets.

Get rid of all hens that are weak, sick, or overly fat, the early molters, those with shrunken scaly combs, those with sunken, dull, listless eyes, those with thick pelvic bones, small abdomens, hard, fat, egg sacks, small,, dry, yellow vents, and those with prominent, yellow shanks, beaks or ear lobes. Save hens that are healthy, strong, active, late molters, those with waxy, full red combs, prominent, bright eyes, thin pelvic bones, large abdomens, soft, flexible egg sacks, large expanded, moist vents, and those with pale shanks, beaks and ear lobes.

Cull all aged male birds that lack constitutional vigor and vitality. Cull all aged hens that do not show exceptional qualities as egg producers.—Paul C. Jamieson, Colorado Agricultural College.

LOOK!
THE minute that pocket gopher touches the cork, he is a dead gopher. The Getsem Gun never fails. It gets them every time. You have tried traps and poison with fairly good results, but with a Getsem Gun you get him and you know you get him because every time the gun barks you drag out a dead gopher.
Liebers "Getsem" Gun is simply a small shot-gun specially made for killing pocket gophers and other destructive pests. It shoots standard .410 shot-gun shells.
How It Operates
Just scrape away the pile of dirt and spike the gun in the ground with the muzzle pointing down the hole. Set the trigger and insert firing pin. In a few moments Mr. Gopher comes up to close the hole, bumps into the cork on the trigger wire and Bang! there's a dead gopher. It never misses.
72 Gophers with 75 Shells
is what one farmer did with a Getsem Gun. Another shot 200 pocket gophers this summer.
Send $3.85 for one Getsem Gun or $11.00 for three. Absolutely guaranteed to satisfy or your money refunded. Ask your dealer—if he can't supply you send your order direct to us—or send for circular.

## RESULTS OF CITRICOLA SCALE CONTROL IN CENTRAL CALIFORNIA

(Continued from Page 333.)

by many growers. We have found that where machines used have maintained a high pressure and the trees are thoroughly covered the results in percentages of dead scale invariably run much higher than in the case where low pressure was maintained and poor distribution of material occurred. A man might better not spray at all than to do a poor job. Another important issue with the grower in choosing the formula he will use in spraying is the cost compared with the probable final results. It has been conclusively proven to us that the most expensive sprays do not always give the best control. It is evident that the grower who is spraying in a haphazard manner with a machine that does not maintain a good pressure and is not thoroughly wetting the trees is working at a financial loss and might better discontinue such work. If all spraying was done in the best possible manner of application at the season of the year that sprays have proven most effective, and with the materials that are giving the best control when costs are considered, I will venture that we would kill at least two scale per unit of cost where one is killed today, and would thus net more on this investment.

After spending much of my time during last year collecting data on spray work and tabulating results on some 6,000 acres there are many questions that might seem simple that I am unable to answer to my own satisfaction and will say that we need more collective evidence on the many issues pertaining to this work. I do feel that the average grower who goes to examine a few of the groves where spraying has been done and is willing to accept as final answer to these questions his conclusions from this limited evidence, is not doing justice to his own business.

### Regarding Scale Conditions This Season Compared With Last

There was a smaller acreage fumigated this year than was covered last season, largely because there were far fewer groves this summer that were severely infested with scale. Late last fall there was an unusually heavy natural mortality, and innumerable groves where no control was applied that were moderately infested last summer are now in little worse condition than they were a year ago and in many cases we find them to be far cleaner. This effect by climatic conditions upon the scale has in many cases been mistaken for the effect of control measures that were applied and in reality did not alone accomplish this clean up. The immense amount of spraying done together with the natural heavy kill retarded the increase of scale to the extent that the number of heavily infested groves where fumigation would be resorted to was greatly reduced. This season in the trees that are scantily foliated and in poor condition or have become very dry during part of the summer we find a heavy mortality, while in most of the healthier trees it remains alarmingly low, indicating that unless there is some very unusual change in this condition we may expect and be prepared to combat a serious condition during the coming season.

The limited time allotted me at this institute prohibits taking up all of the numerous details concerning gray scale control, many of which are more or less important, therefore I will merely touch upon a few which I consider of most importance.

Perhaps the two most important and least understood issues in connection with practical scale control are, first—The ratio of scale increase from year to year under various local environments and the ways in which these environments affect the development of scale, some direct others indirect in their respective actions. Second—The important issue of discriminating between scale control and prevention of scale increase. This question is very often asked by the citrus grower: "I have some gray scale on my orange grove. What should I do about it, spray or fumigate?" I believe this question cannot be answered intelligently unless the proper knowledge of existing conditions is secured.

If the grove in question is vigorous and heavily foliated, with plenty of irrigation water and surrounded by other groves or plantings of a like nature, I would unhesitatingly say in reply to the query that if the infestation is severe or moderate to severe the proper means of control would be fumigation. On the other hand if the grove was in a run-down condition because of lack of water, and adjoined an open grain field or bare hillside, and was lightly infested, or light to moderately infested, spraying with lime-sulphur solution oil and spreader should be employed as the proper means to prevent scale increase.

This of course, is also true to my belief in the case of any grove which is lightly infested, but I could not conscientiously advise a grower to spray a severely infested grove for the purpose of controlling gray scale, and this does not mean that this has not been accomplished. It has in a number of instances to my personal knowledge, but the conclusions arrived at by the writer are taken from averages and not extreme cases. These averages are secured from a careful inspection of 3567 acres of sprayed groves, and 2091 acres of fumigated groves this year, coupled with casual inspections and careful investigations during the past eight years, covering approximately 9,000 acres of sprayed groves and 14,500 acres of fumigated groves. From these observations and careful investigational inspections the following conclusions have been reached:

1. Both spraying and fumigation are necessary methods to be employed by the citrus grower in combating citricola scale in Tulare County at this time.

2. When costs and efficiency are considered, conscientious fumigation with hydrocyanic acid gas has proven itself to be the proper method for the control of citricola scale on groves moderately to severely infested.

3. Spraying with lime-sulphur oil and spreader has proven itself to be an efficient means of preventing scale increase on groves lightly to moderately infested, providing the work is done in a thorough and conscientious manner. There are no doubt other benefits derived from lime-sulphur spraying although as this paper deals with only scale control, I will therefore merely make casual mention of this phase.

In conclusion wish to state that in summing up the matter of citricola scale control in Central California, it appears to the writer that spraying with lime-sulphur solution oil and spreader is the "ounce of prevention" and fumigation with hydrocyanic acid gas the "pound of cure."

## VOCATIONAL EDUCATION IN AGRICULTURE

J. B. Lillard, state supervisor of agricultural education, writes regarding the program for agricultural education for the next year in California. He sends a statement made by C. H. Lane, chief, agricultural education service, federal board for vocational education, from which we quote:

"Agricultural instruction as organized in connection with the vocational programs of the states is so fundamentally sound and practical that it is challenging to the citizenship of the nation to assist in instilling in the minds of our boys and girls the highest ideals of farmer-citizenship.

"One of the greatest problems with which our country has been confronted during the past year is that of a depressed agriculture, resulting in a large way from the pressure of the readjustment following the World War. We are living in a new era and are now in the beginning of an epoch making period. No one can visualize the problems of the future. Vocational education in agriculture equips our future men and women of the farm with a broader vision and a clearer understanding of, not only their individual privileges and responsibilities, but the causes and effects of economic influences upon their united efforts in the interest of maintaining a sound and prosperous agriculture.

"No one will question that agriculture is the basis of our national prosperity and it therefore must be placed and continued on a sound basis, and I know of no better way for gaining this than by developing the best thought and efforts of the young people of our rural communities. More than 50,000 boys and girls have carried on in the United States during the summer months practical work on their home farms under the leadership of approximately 2,000 trained agricultural teachers, and every farmer within reach of a vocational department of agriculture in the high school should see to it this fall that this boy or girl is given an opportunity to take advantage of this new movement in education carried on cooperatively between the United States government and state boards for vocational education."

## CALIFORNIA HAS LARGE CITRUS ACREAGE

Three-fourths of an acre of citrus fruits for each person in California in 1920 is the record California growers have made. About 78 per cent of the acreage is in bearing oranges and 20 per cent in lemons, while new plantings are about 62 per cent oranges and 35 per cent lemons.

Formerly the Navel orange made up about 70 per cent of the orange crop but in 1921 it was only a little over 56 per cent. On the other hand, the Valencia has increased until now it makes up about 43 per cent of the oranges.

To assist growers in understanding cultural and market practices, the University of California college of agriculture is offering its services in several ways. The county farm advisors, the division of citriculture, the citrus experiment station and a correspondence course on citrus fruits are all helping growers to keep up with the best practices and to understand changes in the citrus industry.

HIGH GRADE LIME

MAKES BIGGER CROPS

| | Lbs per ton | Percentage |
|---|---|---|
| Calcium Carbonate | 1857.2 | 92.86% |
| Magnesium Carbonate | 45.2 | 2.26% |
| Nitrates | 4.12 | 0.206% |
| Phosphates | | Traces |
| Moisture | 4.80 | 0.24% |
| | 1911.32 | 95.566% |

Analysis by Pacific Chemical Laboratories San Francisco

This is a marine plant lime of a peculiar formation, which is especially adapted for improving the physical condition of soils, in addition to its excellent chemical qualities. It is very light and bulky, so its physical benefits are distributed accordingly.

You do not buy or pay freight on moisture or material of no value as plant food.

We recommend 1½ tons of our lime every 3 years for average California soils.

$7.00 to $8.00 per ton in bulk carload lots of 30 tons, F. O. B. Central & Northern California S. P. sidings.

### POTATOES AND ONIONS

These are the actual prices obtained between 7 and 8 o'clock, September 26 by wholesalers in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on walk. There may be slight fluctuations during the day's trading.

Potatoes: Demand and movement moderate, market steady. New Stock: Locals, best, sacked 1.35@1.65; mostly, 1.50@1.65; poorer, low as 1.00 cwt. Northerns: Rivers, 2@2.15 per cwt. Sweets: Locals, Nancy Halls, 2½@4; Jerseys, 2@3 lb. Northerns: Nancy Halls, 3½@4 lb.

Onions: Demand and movement slow, market steady. Stocktons: Yellows, 1.25@1.50; Whites, 1.25@1.50. Locals: Whites, 40@60; Spanish, 75@90 lug. Garlic, Mexican best, 7 lb.; Northern, 6@7; poorer, 5.

### PRODUCE MARKET

Trading featureless, the supply outbalancing the demand and practically no change in price. Northern Gravensteins were practically cleaned up, and supplies of local apples are increasing. Northern lettuce continues scare and is selling at around $3.75 per crate.

Peaches, pears and plums are selling well at unchanged prices, and much stock is being drawn out of cold storage. The onion market is slightly firmer following advances in shipping districts.

### VEGETABLES

These are the actual prices obtained between 7 and 8 o'clock, September 26, by wholesalers in their sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms: Cash on the walk.

Beans: San Pedro: Kentucky Wonders, and Limas, 7½@8.

Bunched Vegetables: Per dozen bunches: Turnips, beets, parsnips, 30@35. Parsley and radishes, 15; spinach, 25.

Cabbage: Market steady, quality generally good. Field cr., best mostly, 2.75@3.00.

Cauliflower: Per doz., 90.

Cucumbers: Local, lug, 1.50@1.75; Pickling, 2.75@3.25.

Celery: Movement moderate, market dull. Wide range in quality and prices. Locals, best, 3.00; poorer, 2.50@2.75.

Corn: Green, local, best, lug, 60@90.

Eggplant: Local, 3@4.

Lettuce: Market steady. Locals: Ordinary, leafy, 75@90 cr.; Northern, 3.75@4.00; mostly, 3.75.

Okra: Lb., best, small, 6@7.

Peas: Best, Northern, lb., few best, 12@13; poorer, 6@10.

Peppers: Locals: Bells mostly, 3@4; Chilis, 3@4 lb.; Cherry and Floral Gem, 8; Pimentos, 5@6.

Squash: Market steady. Locals: Summer, lugs, 45@50; Italian, lugs, 70@80; cream, 65.

Tomatoes: Demand moderate, movement slow, market dull. San Pedro: Lugs, best pink, 75@90; ripe, 40@60.

### FRESH FRUIT

These are actual prices obtained September 26 by Los Angeles wholesalers from their sales to retailers, peddlers, hotels, restaurans, cafeterias, etc., as compiled by the U. S. Bureau of Markets. Terms, cash on the walk.

Apples: Demand and movement moderate, market steady. Northerns: Bellefleurs, many green, fancy, 4 tier, 90@1.10; 3½ tier, 1.10@1.35 per box; loose, 2@2½c lb.; loose, King Davids, 3c; Jonathans, 3½c lb.

Grapes: Demand slow, market steady. Northerns and Locals: Muscats, 3½@4; Malagas, 4½@5; Black Hamburg and Rose of Peru, 5; Black Prince, 6; Tokays, 6@7 lb.

Peaches: Market steady. Locals and Northerns: Freestone and Clings, all varieties, best 3@4; poorer, 2 lb.

Pears: Demand good, market steady. Northerns and Locals: Bartletts mostly, 4½@5; overripe, 2@3 lb.

Plums and Prunes: Demand and movement moderate, market steady. Per lb.: Locals, 3@4, according to variety and quality. Northerns: 3@4½ lb.

Watermelons: Demand moderate, market dull. Locals: Klondikes, large sizes, 1.25@1.50 cwt.; smaller, mostly, 1.00 cwt. Northerns: Black Diamond, large, 1.50@1.75.

### CITRUS FRUIT

Grapefruits: Market steady. Locals: packed box, fancy, 9.00@10.50; small sizes, 7.00@8.50 according to size and quality.

Lemons: Demand and movement light, market steady. Special brands, fancy, 8@9; choice, 6.50@7.50.

Oranges: Demand moderate, market steady. Valencias, special brands, $10@11 according to size.

### HONEY

Honey flow in Southern California curtailed after orange flow by drouth. Crop alfalfa honey light due to damage to crop in Northern section by adverse weather conditions and to reduction of acreage in Southern California. Demand and movement moderate, market steady. Carloads f. o. b. usual terms per pound. Extracted, White Orange mostly, 9½ cents; White Sage, 8@8½; Light Amber Sage, 6½@7; Light Amber Alfalfa, 4¼@6½. Comb: Buyers reported offering $2.70 per case for carlots f. o. b. Inyo County points ,but no large sales reported.

### HAY

Following are prices in the general market to growers f. o. b. Los Angeles in carload lots; handling and commission must be added to obtain retail prices on new hay:

Prices quoted f. o. b. L. A. to producers:

| | |
|---|---|
| Tame Oat | 20.00@22.00 |
| Barley Hay | 16.00@18.00 |
| Rabbit Alfalfa | 24.00@26.00 |
| No. 1 Dairy | 22.00@24.00 |
| Standard Alfalfa | 16.00@18.00 |
| Wheat Straw | 8.00@10.00 |
| Barley Straw | 7.00@ 9.00 |

Prices for alfalfa being received by growers on the ranch vary greatly. As approximate figures we may say that Rabbit Alfalfa is bringing the growers around $22 as a fair average. No. 1 dairy is varying from $15 to $17 with $16 as a mean or average price. Standard alfalfa is not much in evidence. Few offer it; fewer want to buy. If sold it brings from $10 up.

### GRAIN

L. A. Grain Exchange prices:
Barley: October delivery, 100 ton lots, 1.36¼@1.37½.

# San Francisco Markets

San Francisco, September 25, 1922.

**Raisins, Sun-Maid Raisin Growers' Prices:**

Under the schedule of prices for the 1922 crop of raisins announced by the Board of Directors of the Sun Maid Raisin Growers to the trade August 9, the growers will receive 5¾ cents for Muscats, 6 cents for Sultanas, and 6½ cents for Thompson's sweat box basis. Northern bleached Thompsons, (Sun Maid quality) oil dipped, soda dipped or choice sulphur bleached Thompsons will bring the grower 6¼ cents. Fancy Northern sulphur bleached (Sun Maid quality) will bring $40 more per ton, extra fancy Northern sulphur bleached (Sun Maid quality) $60 more per ton. Southern bleached (Sun Maid quality) oil dipped, soda dipped and choice sulphur bleached will net the grower 6¾ cents. Fancy Southern sulphur bleached (Sun Maid quality) will bring 9cents. Extra fancy Southern sulphur bleached (Sun Maid quality) will bring 9 cents. Extra fancy Northern or Southern bleached packed by growers, (California brand) soda dipped, oil dipped and choice sulphur bleached are named at 5¾ cents. The price for fancy sulphur bleached (California brand) 9¼ cents. Muscat layers 3 and 4 crown, all packs will bring 7 4-10 cents. Six crowns will net 8 4-10 cents. A $15 bonus will be paid for making layers in addition to half-cent quality bonus for extra standard grade. Layers will be settled for on packout basis as provided for in the crop contract. "These prices," said F. A. Seymour, general manager, "will be returned to the grower on a sweat box basis. Their realization, however, depends upon the disposal of the entire crop at the new prices named by the board."

1921 crop practically sold out.

## Citrus Markets

Los Angeles, September 27, 1922.

Valencias show a great spread between lowest and highest offerings. In the auction as low as $1.85 has been reported and as high as $12.35 in New York on September 20. The small quantity offered has resulted in every consignment of good fruit being picked up immediately. Shortage of cars is interfering somewhat.

Lemon market is strong and much higher. Weather remains favorable to quick sales. Shipments are slackening and it is hoped that a steady winter supply may be kept in the market. F. o. b. quotations have run as high as $9.00.

**Shipments**

Shipments of citrus fruits to date since November 1, 1921. Southern California: Oranges, 22,429 cars; lemons, 4,431; total, 31,860. To same date last season: Oranges, 38,171; lemons, 10.853; total, 49,-024. From Central California to date this season: Oranges, 5,099; lemons, 106; total, 5,205. To same date last season: Oranges, 6,603 cars; lemons, 185; total, 6,788. From Northern California to date Oranges, 22,429 cars; lemons, 9,431; total, 380. To same date last season: Oranges, 305; lemons, 5; total, 310.

### AT THE AUCTION

**September 25**

New York: 22 Val., 2.90@13.20; 2 lem., 6.40@8.60.

Boston: 7 cars Val., 2.40@9.50.

Pittsburg: 4 Val., 2.75@7.55; 2 lem., 6.40@7.55.

Cincinnati: 3 Val., 4.35@7.55; 2 lem., 4.30@7.30.

Cleveland: 1 Val., 6.45@7.75; 1 lem., 4.90@7.90.

St. Louis: 2 Val., 4.00@6.70; 1 lem., 4.40@5.65.

Philadelphia: 4 Val., 2.65@10.85; 1 lem., 6.40@6.95.

**September 26**

New York: 18 Val., 1.85@11.95; 1 lem.,

## Snappy Notes on Livestock

Any error herein is unintentional and subject to correction the following week. This summary is assembled from the best sources obtainable, and both producers and packers can assist by reporting actual sales or buys, giving names, dates and facts, and we will, if requested, withhold names. All we want is fact and a fair deal and correct information for the producers. Address A. L. Spellmeyer, care California Cultivator, 317 Central Avenue, Los Angeles. The Cultivator reaches over 40,000 producing farmers and livestock men.

Beef shortage exists on the Pacific Coast. Two things only prevent a great activity in western cattle and they are being remedied. One thing has been the low carcass beef price obtained by killers and the other the policy of giving a lower price for the small lot of cattle or hogs, to the detriment and discouragement of the small man. This has positively driven the small man out of the Southwest livestock production. Low carcass beef and trimming the small producer are twins in evil effect and one depends on the other. The larger Los Angeles killers have promised to remedy this small lot policy and give the small producer a price equal to the large, but it remains to be seen what their word amounts to in this matter.

A few fancy beef steers are sold at 8 cents here though it is possible better steers may only bring 7.50. A lot of steers at 6 cents was offered that equals the lots purchased on a 7.50 equivalent, but these packers can't seem to keep off manipulations. Carcass prices are two cents better than a month ago in some instances of actual retail sales. This is encouraging.

There isn't any stated price for Los Angeles fat steers except to buy them as cheap as possible at any price from 6 to 7 cents if a man ships in and 6 to 7 cents the same if he holds them at home. And these packers must change that custom soon if they are to have a livestock supply coming into the stockyards here in November.

Lambs are around the 12 cent mark and hogs are over 11. The entire meat trade is strong.

Wool and hides allow a margin now that counts in the killing. There is a stronger demand for feeder lambs and ewe lambs than it's possible to fill. Watch the market for the next two weeks, for something is due to break forth in cattle.—A. L. Spellmeyer.

### LIMA BEAN INFORMATION

Harvesting of Lima and Baby Lima beans is commencing to get well under way in the five counties of Southern California in which these varieties are grown.

Threshing has not proceeded far enough to permit of an accurate estimate as to total production. Some fields have yielded no more than last year, and others an appreciable increase. However, few, if any fields, are yielding over 85 per cent of the amount estimated six weeks ago. Size of Limas from early deliveries shows rather small, an evident result of the August heat wave.

From best information now obtainable, it appears that a liberal estimate of the total production of Limas would be not to exceed 1,200,000 bags, and of Baby Limas a total of about 160,000 bags, which will be considerably less than last year's crop of Baby Limas and carry over.

Since last year's production of Limas amounted to about eight hundred thousand bags, and the carryover in coast warehouses and in distributing markets probably 300,000 bags, it can be seen that the increase in Limas is not likely to exceed 100,000 bags, and, if so, will be less than the average annual consumption.

As about 1,100,000 bags of Limas were marketed last year, mostly at prices ranging from $5.75 to $9.25, it seems reasonable to assume that 1,-200,000 bags could be marketed this season, mostly at shipping prices ranging from $6.25 to $7.00 per cwt., when markets are bare and business conditions improved, providing growers will keep posted as to the real facts and move their crops to market in an orderly manner.

Shipments to cover sales made for September delivery are going forward as fast as beans can be delivered and cleaned, and numerous telegraphic requests for quotations are coming in from various markets indicating the wholesale trade is thinking about purchasing for October shipment.

The California Lima Bean Growers Association on September 20 confirmed carload sales of both Limas and Baby Limas for shipment during the first half of October at $6.25, and car of September shipment Limas at $6.50 f. o. b. rail cars. Considerable purchases of Limas from growers during past week at from $6.00 to $6.15 per cwt.

Free buying and selling is expected to develop within the next two or three weeks.—R. L. Churchill, manager California Lima Bean Growers.

### MODERN PLUMBING IN THE MAKING

An exhibit which is being installed at the Riverside fair shows the actual manufacture of bath tubs and how various forms of porcelain enamel plumbing fixtures are made. This exhibit was one of the most popular at the recent Pageant of Progress in Los Angeles. At no time, when the booth was open, was it not crowded. The exhibit itself shows a model reproduction of 38 acres of Whiting-Mead industries, including their foundries, enameling works, pottery plant, lumber yards and mills, and in the center of the display a model enameling oven where the model cast iron tubs are placed and the enamel properly baked on. The exhibit is interesting and educational. It should be seen by every visitor to the fair.

DAVIS GLENDALE

**Overhead Irrigation SYSTEM**

*"Just Like Rain"*

The Overhead system of irrigation is Nature's way. It is the simplest and cheapest method of applying irrigation to truck crops, gardens, green houses, lawns, etc.

Saves Water.
Gives Even Distribution.
Works Night or Day Without Watching.
No Ditches to Dig. No Heading-in to Do.
Once Installed Will Last a Lifetime.
Easy to Operate.

We have complete installations in our open field crops and also in our four 750 foot green houses. If you are interested call and see it in operation, or fill out the coupon for information and prices.

MAIL THIS COUPON TODAY

Davis Glendale Co.,
P. O. Box 147, Glendale, Calif.
Please send me complete information and prices of your overhead irrigation systems.

# Radio

## The Greatest Radio Offer of the Year—Absolutely Complete, $49.50

This special receiving outfit will give as good results as any outfit of this improved type on the market. It is absolutely complete, there is nothing extra to buy. We include everything—you simply put up the aerial, connect the instruments, which is easy to do, and in less than half an hour you can be receiving signals, radio music, lectures, stock reports, market reports, or any other radio program sent out.

In making tests with this set in Chicago we regularly heard Detroit, Pittsburgh and other stations were often tuned in. Of course, atmospheric conditions affect the range of this or any other receiving set made.

### Highest Development in Radio Receiving

This outfit will equal in results any outfit of this type regardless of price. It is especially made for us and has behind it the fifty year old guarantee of Montgomery Ward & Co.: "Satisfaction guaranteed or your money back." You take no risk whatever in ordering this set.

### Long Distance Vacuum Tube Receiving Set

The complete outfit includes our special Combined Tuner and Detector; Special 2000 ohm Double Head Set; Radio Storage Battery; one Detector Tube, one "B" Battery; and complete antenna and connecting equipment including 150 feet bare copper wire and 25 feet insulated wire, porcelain tube; double throw switch; 2 antenna insulators; lightning protector; ground clamp, 2 screw eyes and 25 feet of wire for instrument connections.

Order this set at our risk. It will be packed carefully and shipped immediately from our nearest house. Shipping weight 40 pounds.

563Z599—Complete Outfit..... **$49.50**

Order this outfit today and start at once enjoying in your home the most marvelous invention of the age.

Price of receiving Set without batteries, head piece, switch and aerial, shipping weight 8 pounds: 563Z598—$27.50.

Send money order or check to the one of our five houses that is nearest to you.

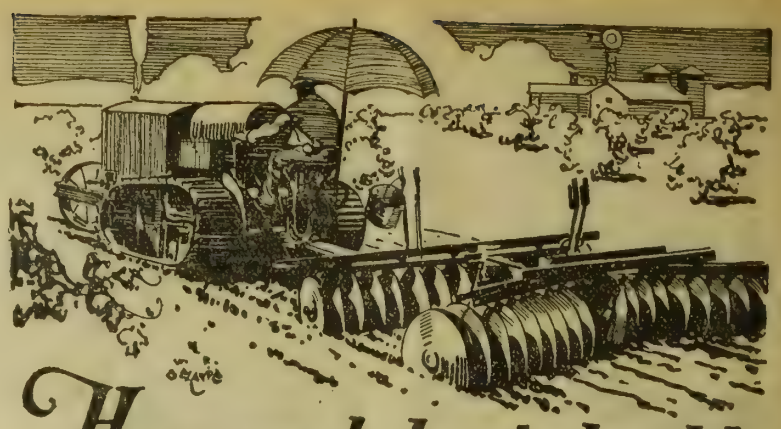
FRESNO CALIFORNIA



# How much heat should a tractor oil stand?

And how long should it "stand up" in that heat? Tractor oil *must* resist high operating temperatures if it is to keep your working equipment on the job.

Zerolene resists heat. Fill your tractor crankcase with this lubricant of stability, refined from crudes carefully selected for heat-resisting quality.

## *Oiliness — Purity*

Zerolene penetrates to small-clearance bearings and clings evenly. At the same time it splashes freely, and you get all the power your tractor engine is rated to deliver.

Because it has purity, Zerolene burns clean, and deposits but a small amount of carbon, so soft and flaky that most of it blows out harmlessly with the exhaust. An exclusive high-vacuum refining process has removed all impurities, yet retained the highest lubricating value.

Consult the Zerolene Correct Lubrication Chart for the correct grade for your tractor, truck or automobile.

STANDARD OIL COMPANY
(California)

"An analysis of Zerolene shows that it maintains always the right 'body' at all operating temperatures, following in close relation the decrease in bearing clearances caused by heat expansion."

*—Board of Lubrication Engineers.*

The Standard Oil ZEROLENE For Motor Cars

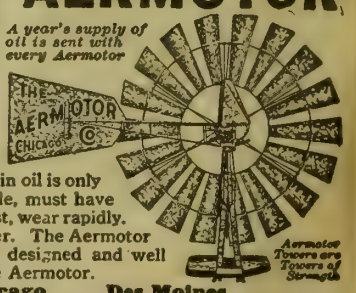
**more power & speed ~ less friction and wear ~ thru *Correct Lubrication***

# THE AUTO-OILED AERMOTOR

## A Real Self-Oiling Windmill

Oil an Aermotor once a year and it is always oiled. Every moving part is completely and fully oiled. A constant stream of oil flows on every bearing. The shafts run in oil. The double gears run in oil in a tightly enclosed gear case. Friction and wear are practically eliminated.

*A year's supply of oil is sent with every Aermotor*



Any windmill which does not have the gears running in oil is only half oiled. A modern windmill, like a modern automobile, must have its gears enclosed and run in oil. Dry gears, exposed to dust, wear rapidly. Dry bearings and dry gears cause friction and loss of power. The Aermotor pumps in the lightest breeze because it is correctly designed and well oiled. To get everlasting windmill satisfaction, buy the Aermotor.

OUR ADVERTISING RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest, bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If among the more than 40,000 Cultivator's weekly circulation any fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

## EDITORIALETTES

The beautiful maple leaf on the cover owes its beauty—or its ugliness—to the work of the beetle shown below the leaf. This pest is known as Popillia japonica, or, more generally, the Japanese beetle. Like many another small creature this little insect has succeeded in stirring up the United States. It has brought two states and the federal government into harmonious action, and a laboratory has been established and Quarantine 48 promulgated. The pest already has occupied a large section of New Jersey, has surrounded Philadelphia and is at work in many of the counties of Pennsylvania.

* * *

Quarantine 48 forbids the movement from the infested area of sweet corn, grapes, lettuce, forage crops, including all hay and straw, nursery stock, both ornamental and all greenhouse stock, soil, compost, manures and, one may almost say, every living green thing, between June 15 and October 15 of each year. The pest is not fastidious in its tastes and will eat smartweed, ragweed and almost everything which grows.

* * *

The beetles appear during the middle or latter part of June, but are most abundant and active during July and August. They feed on fruit, foliage and blossoms of most cultivated crops, as well as many shade trees and common weeds of field and roadside.

* * *

The devastation is not only awful in its completeness but swift in accomplishment. Quarantine Officer Shaw, in charge of plant quarantine work in New York harbor, said to us that he had seen trees carrying clusters of this pest working on apples or other fruits, and that from one apple he had at one grasp taken a double handful of the pests, leaving only the large core of the fruit.

* * *

The Japanese beetle laboratory has been established at Riverton, New Jersey, through cooperation of New Jersey, Pennsylvania and the U.S.D.A. The laboratory has issued bulletins, window hangers, and other publicity, giving warning of the menace. The penalties are severe, ranging from $500 fine and one year imprisonment, downward.

* * *

It is a satisfaction to see the vigor with which the people in this section have taken hold of the situation in the effort to control this pest. Even as it is, there does not appear to be the thoroughness which is generally observed in California. Especially is this true in intercounty shipments. There is not that thoroughness of organization shown by the horticultural commissioners of this state. Worse, however, is the fact that the producers generally are not awake to the real menace to agriculture. With gypsy moth, corn borer and a few other destructive pests, the East has had its lesson, but it seems a hard one to learn. Officials find difficult enforcement of any law or regulation with which the people are not in cordial sympathy. California quarantine is receiving that sympathetic support which will, we hope, result in keeping more pests than we already have the other side of the Mississippi and the Pacific.

* * *

The most discouraging feature in California is the increase in number of war vessels and transports endeavoring to land contraband fruits or plants. The officers are largely Eastern people and not in sympathy with agriculture, and not only neglect, but sometimes refuse, to obey department regulations. A recent bulletin of the California department of agriculture notes the fact that the largest interception of prohibited fruit fly material ever recorded at the port of San Francisco was made on September 1, last, on the arrival here of the U. S. navy transport Henderson. This transport came from the Orient, and in addition to a large passenger list of troops and civilians, had among its passengers the secretary of the United States navy and government officials accompanying him. The records of the California department of agriculture show that the refrigerators and storage rooms of the transport contained a long list (which this report enumerates) of prohibited fruits, against the law of California and the law of the United States to bring in, as possible and probable bearers of the Mediterranean fruit fly and other pests. Infestations by both the Mediterranean fruit fly and the melon fly were noted in this material, and all of it was boiled up and thrown overboard.

* * *

Nor are all Californians without blame. We saw the "City of Los Angeles," direct from Mediterranean fly infested Hawaii, sail into Los Angeles harbor last Monday and discharge her cargo and large list of passengers. These were, practically every one of them, Californians, and the great majority loyal supporters of the inspectors who looked through their baggage and belongings to intercept any possible pests. On the other hand, there were a few grumblers, those who looked at the two hour delay as unreasonable. They were anxious to get to their homes or back to their desks—that for the moment being more important than saving the fruit industry of the state. And these—a very few—called the effort of the inspectors bungling meddlesomeness.

* * *

One of these impatient ones insisted that while the ordinary rabble of Asiatics coming in on a vessel from Japan or Hongkong might well be examined, representative citizens, nearly all members of the chamber of commerce and all thoroughly understanding the penalty to California in case of introduction of serious pest, should be exempt. But a few minutes after the remark was made, the speaker was shown two avocados which a passenger had endeavored to get by the inspectors.

* * *

As a rule the Chamber of Commerce folks were real sports. They fully realized the menace to California's future and aided in every way in most rigid enforcement of the quarantine.

* * *

One feature at the Southern California fair to be held at Riverside next week will be Horticultural Commissioners' Day. Director of Agriculture Hecke will be there and make address to the commissioners on the evening of October 10, and the next morning there will be an automobile drive to citrus groves, a stop at the experiment station and a trip to the top of Mt. Rubidoux. The headquarters, however, on the fair grounds, will be in the farm bureau tent. At a meeting to be held there, an address will be made by Lee A. Strong in which he will touch upon the present fight being made to prevent the entrance into California of the Mediterranean fruit fly.

* * *

It will take almost 800 refrigerator cars daily to handle the grapes and other fruit of California during the next few weeks. We won't get that many cars, but shippers, state department of agriculture, farm bureau and others are pulling on every string which can be reached to get as many cars as possible. The water shipment which was forwarded in chamber charged with carbonic acid gas, has proven a disappointment. Those who tried the experiment, however, assure us success will yet be had in water shipment of fresh grapes.

## WALNUT PRICES

Opening prices on California walnuts just named by California Walnut Growers are No. 1, 22½ cents; No. 2, 17½ cents, and fancy budded, 26 cents. Last year's closing price for No. 1 was 27 cents. The tariff argument that "higher tariff, higher prices" would obtain has one knockout blow in the action of the walnut people. The association states:

"In refutation of the assertion made by interests which strongly opposed the passage of the tariff bill, to the effect that it simply will enable manufacturers and producers to impose upon the public, we have just advised the wholesale and manufacturing trade of a material reduction in the price of both unshelled and shelled walnuts. This happens just at a time when the new tariff bill gives us a 200 per cent increase in duty on shelled walnuts. We feel that you will be glad to know that the efforts you put behind the tariff schedule, which resulted in its passage, will not prove to be a boomerang to embarrass you, nor a pretext to gouge the American people."

## CALIFORNIA IS PROTECTED

Growers of almonds, dates, figs, grapes, lemons, oranges, olives and on down to walnuts, are generally pleased with the recognition which congress extended to California products. Statements have been issued giving credit to our two state senators and practically all of our representatives, for the magnificent work they gave to secure justice to California. We rather take it that in addition there are some faithful workers in some of California's cooperative organizations who have also done some exceptionally hard work. As one incident of many of these jobs we refer to seeing in a little inside office in the House office building in Washington only a few weeks ago R. H. Taylor of the Almond Growers, formerly of the university and afterwards with the state department of agriculture, with sleeves rolled up, gathering facts and figures and bringing them together in most convincing statements as to the impossibility of California laborers competing with Mediterranean laborers in producing almonds. Mr. Taylor was working for the "5 and 15," but instead of that protection the almonds were really given "43/4 and 14." Other California products protected make a list altogether too long for us to give, but amongst them are: Berries, 1¼; berries dried, 2½; cherries, 2; prepared or preserved, 40 per cent ad valorem; citrons, 2; candied, 4½; figs, 2; prepared, 35 per cent ad valorem; dates, 1; grapes, 25 cents per cubic foot; raisins, 2 cents per pound; lemons, 2; oranges, 1; grapefruit, 1; olives, 20 cents per gallon; dried ripe, 4; peaches and pears, 1; evaporated, 2; plums, prunes, etc., fresh or dried, ½ cent; honey, 3; walnuts, 4; shelled, 12; pecans, 3; shelled, 6; olive oil, 7½ cents per pound; dried beans, 1¾.

This, of course, succeeds the emergency tariff bill. Literally thousands of amendments or changes have been made since it was originally presented, and practically two years of time has been given up to it in the congress of the United States.

## THE BUDGET

The Commonwealth Club of San Francisco is making a fight for a state budget amendment which will come before the electors next month. The club feels that the more or less loose methods of the past must be set aside and the business handled for the state with some of the same judgment which has prevailed in private and corporate interests. Mr. Boynton of the Commonwealth Club says regarding this bill:

"Government is a business and the state should be run on business principles. The administrative machinery is definitely established, and the cost of running various departments should be accurately estimated and expenditures conform to such estimates. Under the budget system every state department would submit in advance its estimated requirements and these estimates would be correlated by trained economists under the direction of the governor. The extravagant and wasteful practice of having the legislature appropriate specific amounts for definite purposes without consideration of available funds to meet these costs would be done away with and the taxpayer would know fairly accurately just what the state would spend in any year and where the funds will go."

# California Cultivator

Vol. LIX, No. 15 | Los Angeles, October 7, 1922 | One Dollar Yearly

# Subsoiling and Deep Irrigation

THERE is fascination in anything mysterious, and there is something mysterious in soil. We used to think it was a matter of chemistry; now we realize that physics has more to do with proper soil handling than does chemistry. There must be right conditions for the growth of billions of microscopic life in order to create right chemical conditions. As to tillage, "Touch only the merest surface without disturbing the tiny feeding roots which come up to seek the nourishment made available by sun and air" is heard from one orchardist, while another says—with even greater emphasis—"I know that my orchard has been improved in health and general appearance and in capacity to bear big crops of perfect fruit by putting in the subsoiler and tearing out rootlets, even roots, and forcing other roots to seek for the potash and other needed elements in the lower depths of the orchard. These diverse opinions may be because of different types of soil or innumerable conditions, or they may be due to differences in power of observation. Sure it is that by comparison of these opinions of practical soil culturists we are able to sift out the truth. The Cultivator is glad to aid in the sifting, and to that end gives the following practical ideas from three widely separated sections.

* * *

**A. E. Tatum, Visalia**

The subject seems to be going the rounds and occasionally is being added to and in some instances taken from, until now we have arrived at the point of issue which is used in connection with deep cultivation and subsoil irrigation used in connection with deep cultivation versus surface irrigation and shallow tillage.

Now we are discussing the subject from its different angles and attitudes, and I would like to say that I am the person who is going to do this very act, that is, I am going to do the subsoil-irrigation and would like to state that I am going to do this on the ground that is set to peach trees, cling. They are about nine years old and it remains a question to be solved whether it is wiser to so proceed or let the trees eventually die out or go down and reach new avenues of nutrition which will unlock the potash which lies in deeper tillage. As we are all aware, the new avenues and new foods are the only thing that will revive or stimulate the new rootlets finding their way into this new bed. Now we are all aware that the trees after attaining to this age will eventually rob their neighbor trees of more or less of their needed nourishment, and if we so confine their feeding area and apply the moisture where it is allowed to penetrate at will and slowly enough to be of some material benefit in putting into solution so as to be assimilated by the rootlets, we have at least remedied the seriousness of the affliction.

I want to state to those interested in this venture that I find at the age of nine years most all of the orchards have trees that you can very nearly push from their seatings. I have found in my orchards that I am able to push some of my peach trees over with just a little stubborn resistance as they are so shallow rooted. It is just a matter of slow starvation to the trees.

When I first decided to make the change I just asked myself was it wiser to continue the habit, let the trees rob one another and continue to run the water at the mercy of the sun and warm ground or go down and unlock the rich fertility already further down in the ground and take chances of cutting feeder roots and isolating the trees to give each and every tree just so many square feet of feeding surface and break the irrigation pan.

This year my crop was way off and with signs of going further off another year, so in evidence of all this and the possibility of making this either better or worse, I took the stand of going down after it, either more peaches or less peaches. As it was it would not pay expenses on the place, so now let's watch for results. I am going to use deep tillage also with the subsoiling irrigation.

I have made careful survey of different orchards that have attained some years and I find that all are beginning to wane, look shabby and no longer pay to cultivate. After an examination I find that all had surface tillage and surface irrigation, and that there is a pan they never did break through.

This idea of running water from a pump through small ditches about three feet apart over the surface of the ground adds plow pan every time and none of it is ever broken. If such a thing comes to pass that it is broken after the very first application of the ditch water the ground is run together, as it were, of a cement nature, just where it was at the beginning, and the persistent subsoiling and subirrigation and deep tillage go hand in hand to remedy the deficiency in the crops and conditions of orchards and vineyards.

Now if any reader has a few words to add to the already gained momentum, please do not sit back, but join the circle and let's thresh this thing out to an end which will make the better for all.

* * *

**Forrest Manning, Glendora**

In recent issue of the Cultivator I noticed an article on "Subsoiling and Deep Irrigation," also a reference to question by a Visalia subscriber, and an answer to it by Mr. Neff, all of which I have read with interest.

I am taking the liberty of writing my experience along that line. My Valencia grove, about 17 years old, is in a very heavy soil, though not adobe, and my observation on experiments I have made during the past two or three years leads me to agree pretty closely with Mr. Lehr of the Killefer Company.

For a couple of years I subsoiled once between the rows, beginning perhaps with the August irrigation, but some time during the 1921 season Mr. Nelson, the state soil moisture expert, gave a talk and demonstration at the Azusa Foot Hill Citrus Company's ranch in connection with the farm bureau program.

From Mr. Nelson's talk I got the following impressions, viz., that we were not running our furrows close enough to the trees and that after the danger of June and July drop was past one could subsoil at least twice

(Continued on Page 379.)

# Dehydrator Plants Are Taking Care of a Big Crop

By J. H. Yetter

FRUIT evaporation, dehydration, cold storage, canning and all other agencies are taking care of an enormous fruit crop and demonstrating their great value to the growers of California this year as never before.

The average man thinks that the only worry or trouble a grower has is to produce a crop. This is not one-half or one-third of the battle as all the growers know. This year with California's unusual crop, with a fair demand for practically all of it, the transportation system of the country failed to maintain 100 per cent efficiency. This has made plain to the fruit industry of California the necessity of provision for taking care of the crop by dehydration, canning, cold storage, warehousing and reduction plants.

One of the best examples of foresightedness in operation in California today is a newly constructed plant by the J. H. Strait Company of Redlands which has installed a process evaporator with a capacity of 15 to 20 tons of apples per day. This plant is operating in two to three shifts, turning into a splendid marketable product such apples as are not selected for packing or canning.

Earlier in the season a run was made on apricots with splendid success, the fruit being turned out in excellent condition with promise of good marketing contracts. There are five or more outlets for the crop, the first being a green fruit trade, the next the canner, the third the evaporator or dehydrator and the poorer grades going to the cider mills or the vinegar mills, and it may be stated that there are other enterprising concerns in the Redlands district, one of which is operating a cider mill, another a vinegar plant, so that this district is as nearly 100 per cent efficient as any section of the country for taking care of its almost unlimited fruit production.

**How the Dehydrator Works**

California fruit growers have been

# Agricultural News Notes of the Pacific Coast

## Northern California

A viticultural experiment station is to be built near Marysville, Yuba County.

September 13, Woodland, Yolo County, shipped 5,000 sacks of wheat from one mill.

Northern California, from San Francisco to Eureka, was visited by a rain on September 26.

Petaluma, Sonoma County, boasts a pear tree 67 years old, on the Thompson place, that is still bearing.

A new paved highway just opened shortens the distance from Yolo County points to the bay cities by 25 miles.

Prune harvesting in the Anderson Valley, Shasta County, is about over; the estimate is two and a half tons to the acre.

Corning, Tehama County, reports a heavy Smyrna fig crop, with several figs measuring nine and a half inches each in circumference.

The third annual show of the "Horticultural Round Table" will be held in Hilgard Hall, University of California, Berkeley, November 16-18.

Potato growers in the Stockton delta section have formed the California Delta Potato Growers Association, with headquarters in San Francisco.

Oswald, a small station in Sutter County, shipped 1,271 cars of peaches in 52 days, representing a value of $1,143,900, and more peaches to follow.

Colusa County vineyardists complain of great destruction of grapes by quails and the season does not open for killing them until November 15.

The Yuba County chamber of commerce announces that the fruit tree acreage of the county has grown during the past ten years from 1,538 to 9,790.

The famous Italian-Swiss Colony Wine Corporation, for years the heaviest shipper of wine from the Sonoma Valley, has filed an application at San Francisco for dissolution.

The Poultry Producers of Central California, Inc., have established headquarters at San Francisco, also distributing stores at Oakland and packing plants at Petaluma and Santa Cruz.

A new Phillips Cling peach has been found at Yuba City, Sutter County, a single tree, that fruits ten days later than any other in the orchard. It has been called, provisionally, the Giblin.

A 100 acre-tract five miles north of Yuba City in Sutter County will be planted to cherries the coming season, and the claim is made that this will be the world's largest tract wholly in cherries.

On September 18, Yuba City, Sutter County, shipped 145 cars of Phillips Cling peaches to outside canneries, the record for one day. Also the train record was broken with 85 cars of peaches in one train.

Exports of dairy products from San Francisco during the week ending September 23 were, in pounds: Butter, 55,479; cheese, 20,799; condensed milk, 92,675; evaporated milk, 559,280; eggs, 28,560 dozen. Nearly all this went to Hawaii and the Philippines.

## Central California

The Merced fig packing house will send out about 1,200 tons of figs this year.

Porterville, Tulare County, will ship 40 cars of pomegranates during October.

The Santa Cruz County fair will be held at Bush League Park, Santa Cruz, October 11-16.

Clovis, Fresno County, opened a new fruit packing house the last week in September.

Pear trees 60 years old are still bearing heavy crops at Saranap, Contra Costa County.

Reedley, Fresno County, reports that its cannery has a payroll of more than $8,000 a week.

The Brentwood district of Contra Costa County will grow 110 acres of cauliflower this season.

The Porterville, Tulare County, Poultry Association shipped 16,602 dozen eggs during August.

A Hanford, Kings County, farmer recently shipped 1,000 purebred Rambouillet ewes to Montana.

A firm of sheep feeders at Wren, Oregon, sent 65 purebred sheep, of five breeds, to the Fresno fair.

Mountain View, Santa Clara County, is shipping strawberries by the carload to Chicago and eastern points.

The almond growers association of Oakdale, Stanislaus County, shipped its first car of almonds September 21.

Exeter, Tulare County, will build a cooperative precooling plant that will have a 200 ton capacity to handle grapes.

At several points in Tulare County two year old Phillips Cling peach trees have produced a ton of fruit to the acre.

An orchardist at Winton, Merced County, sold from five large capri fig trees $110 worth of capri figs at one cent each.

A bunch of Thompson seedless grapes grown at Ceres, Stanislaus County, weighed a little more than seven pounds.

A syndicate from Pomona, Los Angeles County, has bought the 3,500 acre Spreckels ranch near Aptos, Santa Cruz County.

Horticultural Commissioner Brann says that Tulare County's crop of Emperor grapes, the harvesting of which began October 1, will be 100 per cent normal.

Modesto, Stanislaus County, has such a labor shortage in the canneries that the chamber of commerce has asked school girls to use spare time in the cannery work.

The sale of the lands of the fourth unit at Delhi Colony, Merced County, will open November 1, and consist of 87 farms and nine two acre farm laborer allotments.

Trees will be planted, through cooperative effort, from Livingston, Merced County, to Turlock, Stanislaus County, the state to furnish the trees without cost to planters.

Fresno County's grape acreage is reported as follows: Muscats, 70,605 acres; Thompsons, 60,167; Sultanas, 6,888; Malagas, 16,057; Feherszagos, 4,947; black grapes, 3,637; currants, 236.

## Southern California

All the streets in Oxnard, Ventura County, will be paved by January, 1923.

The Yucaipa, San Bernardino County, apple show will be held November 8-11.

The Deglet Noor Date Packing Association opened its new plant at Indio, for packing dates, on September 25.

The 1922 crop of Lima beans in Southern California is estimated at 1,200,000 bags; Baby Limas 160,000 bags.

The new $15,000 dehydration plant at Redlands has sent some of its dried orange products to foreign markets for trial.

Banning, San Bernardino County, reports a light crop of almonds and that all will be harvested early this month.

Broom corn is being sent from Waltrip, Imperial County, to Los Angeles, where it brings from $150 to $175 a ton.

Three tons of date palm leaves were sent from Coachella to New York, for the annual Jewish feast which opened October 7.

English sparrows have been observed at La Jolla, San Diego County, feeding on the snails which are such a pest in that territory.

A $275,000 pre-cooling plant for the pear growing industry of the South Antelope Valley has just been completed at Palmdale.

A new gypsum mine was discovered near Dixieland, Imperial County, and the first carload was shipped, September 20, to Los Angeles.

The Live Oak Canyon dam has been completed. This will protect the orange orchards west of La Verne, Los Angeles County, from flood waters.

The new state highway connecting the Victor Valley, San Bernardino County, with the county seat and southern cities has just been opened.

Fumigation for black scale in Riverside County, western district, began September 25, and, in connection with that for citricola scale, will run to at least October 15.

Farm Adviser Wahlberg says that but five walnut groves in a total of 141, chosen at random in Orange County, are planted far enough apart for best crop returns.

The Imperial Valley has a fine turkey crop but present prices for young toms range about 32 cents and raisers expect 42 cents about Thanksgiving, so none are marketable.

Evening meetings for citrus growers interested in the citrus survey of Los Angeles County will be held in October as follows: Azusa, 9; Glendale, 16; Covina, 23; San Dimas, 30.

Imperial Valley has sent out, in carload lots only, as follows: pomelos, 39, cantaloupes, 12,477; lettuce, 4,559; watermelons and casabas, 1,998; grapes, 36. Express shipments will add 300 cars to the total.

General picking of apples in the Yucaipa Valley, San Bernardino County, began September 15, with King David and Jonathan. Picking Delicious began on the 20th. About a half million boxes will hold the crop.

## The Coast and General

Yavapai County, Arizona, has 60,000 Angora goats.

The prune crop of Clarke County, Washington, will exceed 9,000,000 pounds.

Bellingham, Washington, reports the 1922 peach crop as the greatest ever known there.

Five hundred acres in Escambia County, Florida, were set to Satsuma oranges in 1922.

A new union railroad depot is to be built at Phoenix, Arizona. Bids to be opened October 19.

Palm Beach County, Florida, shipped over a half million dollars worth of potatoes during 1922.

For the first time Pima County, Arizona, is growing commercial lettuce with more than 100 acres planted.

The federal government is about to open for sale the timber supply on 550,000 acres in eastern Oregon.

An orchard of Delicious apples near Nampa, Idaho, but 11 years old, has yielded 40 boxes of No. 1 apples to the tree.

Shipments of pomelos from Florida began during September, but "full swing" will not be reached before October 15-20.

One-half the wheat crop of the Pullman, Washington, district has been sold at prices ranging from 85 to 92 cents.

All the d'Anjou pear crop in the Yakima Valley, Washington, is to be held in cold storage for the eastern Christmas trade.

A new million dollar sugar mill has just been completed on the Miami canal, Florida. Its capacity is 1,000 tons of cane a day.

The tobacco industry of Southern Florida faces a serious labor shortage which in turn will result in a shortage of Christmas cigars.

The average daily temperature in Arizona during September was seven degrees above normal, causing early ripening of all crops.

The Hawaiian Pineapple Company, of Honolulu has leased 12,000 additional acres and will at once plant 3,000 acres of pineapples.

More than an inch of rain fell in the Fort Bayard section of New Mexico last week and stock ranges and water conditions are much improved.

Hot weather during the entire month of September has matured the Arizona cotton crop very early, likewise Salway peaches and Verde apples.

The pineapple industry on the east coast of Florida is enjoying a revival; no Florida cuttings are propagated, but all obtained outside the state.

More than 5,000 cows and calves from outside the state reached Aricava, Arizona, in one week, to be distributed in the Tres Bellotes section.

On September 21 the new tariff on eggs went in effect: 8 cents a dozen in the shell, six cents a pound on frozen eggs and 18 cents a pound on dried eggs.

Many cattle from New Mexico and western Texas have been sent to ranges in the Tucson, Arizona section, on account of drouth in the former districts.

# What is the Best Pear Stock?

By Leonard Coates

The Cultivator has had several articles during the past few years by Mr. Wisker and others, in which dwarfing, standard trees, resistance to blight and other questions have been discussed. Mr. Coates renews the discussion, giving attention, not only to blight, but to excessive moisture and root aphis resistance. The questions are so full of interest that we have asked others to join in the discussion.

THIS is a difficult and unsolved problem in view of comparative resistance to excessive moisture, root aphis and pear blight.

For many years pears on Japan pear root have been called for by planters, but what created the demand is hard to say, unless the statement that this stock was resistant to the blight was the cause of it. Of course there is great variation in seedlings, but all of the type (or species, if there be but one) differ from the European in being deeper rooting and the roots being less fibrous. This would appeal to the California planter.

It is very evident, however, that the Japanese pear stocks will not stand as much water as the previously used French stocks, which had more fibrous roots and not so much downward vertical action. It is no uncommon sight to see young pear trees dead from sour sap, sometimes hundreds in an orchard, following a wet winter.

On the other hand the Japanese stock is not so liable to injury from aphis as the more fibrous roots, though, with the extra care now being displayed by nurserymen and county inspectors, not much more danger from this source need be feared.

Pear blight may be controlled through Vigilance (with a capital "V") and is quite costly. Furthermore, there is no way by which its recurrence, and in perhaps a more virulent manner, may be prevented. The owner himself, with the utmost care, may overlook some infection, so the danger increases with larger orchards and more or less careless or incompetent help. This has led to the introduction and experimentation with some Asiatic stocks, some of which are resistant, and, perhaps, immune to bacterial attack of this nature. A. L. Wisker is foremost in this work in California.

The first difficulty is the obtaining of seed of Pyrus usuriensis or of any other species which is true and unmixed by contact with other species. Some have been collected through the United States department of agriculture by the late Prof. Meyer and also by Prof. Reimer of Oregon, who is the leading authority on the subject, and who is carrying on exhaustive experiments to determine the comparative resistance of certain stocks.

It does not seem possible, however, that seedlings may ever be depended on, which would mean, first, proof of immunity of offspring of a certain tree, and then its complete isolation so that future seed may not by any possible chance have been pollenized from any other source. Therefore, the so-called "resistance" of any stocks on the market is problematical or at best comparative.

The only practical means to the desired end is, first, to find a tree that does resist infection, and then to double-work. When I put this question to Prof. Reimer he concurred in the surmise.

I found, on growing plants from Pyrus usuriensis (so-called), a great variation in foliage, color of wood, etc., evidence that all could not possess the same "resistant" property. I selected three strong seedlings of very distinct appearance or type, and Mr. Sydney Stokes, horticultural commissioner of Lake County, kindly consented to make a test in his own orchard by grafting these three types on different limbs on a well grown, mature Bartlett pear tree. These grafts will next spring be grafted back to Bartlett, and the resulting Bartlett wood inoculated with the disease. If, then, the blight is checked when it reaches any one of these usuriensis grafts, its resistance to the disease is established. If the blight spreads downwards through this wood there is nothing to do but to try again.

It will readily be seen by practical growers that once this immunity is established it is merely the matter of using the available wood to graft on to old trees until there is supply enough to begin double-working in the nursery and growing really resistant pear trees. This same principle, and practice, may easily apply in cases of other bacterial disease. A seedling, owing to its variation, can never be relied upon, while an individual specimen may be found that resists gummosis, let us say. Double-working may again be the remedy.

This brings us to a brief consideration of the quince as a stock for the pear. This stock has always been used for dwarfing the pear and is used abroad almost exclusively for that purpose as in the United States for the amateur's garden. To a less extent it is used in commercial planting, and where this is so in California a double-worked tree is grown in the nursery, or the Beurre Hardy on quince root is planted in the orchard and later top-grafted to Bartlett or whatever the desired variety may be. The reason for this is that the Beurre Hardy makes a perfect union with quince, which Bartlett and many other varieties do not, and budding or grafting any other pear to Hardy is absolutely free from any possibility of failure.

The Bartlett pear or any other variety so double-worked is a perfect commercial success, and the quince root thrives in heavy or wet land where the pear roots would languish. Furthermore, it is not a dwarf tree by any means although it will commence to bear fruit earlier than on any other root. Trees in my own orchard by actual measurement average eight feet high and 1¼ to 1½ inches diameter of trunk with a well branched form, many having fruit and planted in January 1920 as dormant bud trees so really only two year old trees at this date.

What is needed is an educated demand from the planter so that the nurseries will have some incentive to raise double-worked trees or any other and on certain types of roots which experience has shown to be superior.

Years ago I received a letter from a grower wanting pears on Myrobolan root: an instance of unthinking, unintelligent demand. It is the business of the nurseryman to supply the demand, but growers should remember that as it takes two to four years to raise a fruit tree so he should more thoroughly inform himself and if anything special is desired make a contract ahead.

* * *

By F. W. Sand

This is indeed a very interesting and educational article and I believe

(Continued on Page 377)

# This Month in the Vegetable Garden

## Northern California

By A. R. Gould

NOW that the days are getting shorter and somewhat cooler we can plan for our winter garden, but this does not mean that there will be less to do as there is no rest for the gardener, and those plots which we shall plan to use for our summer crops must be cleaned and dug over several times during the season. In fact, every plot should be well dug or trenched with manure before planting as plant food must be supplied if we expect results. It is poor policy to try to save on manure or any fertilizer as this is an essential to success. Decayed leaves and garden refuse should all be dug in as this is invaluable, and our observations lead us to believe that were this practice followed more religiously our soils would be in a much more fertile condition. Even the contents of the garbage can will make good manure if dug in deeply and allowed to rot.

Any plants affected by fungus diseases should be burnt and not buried as there is a chance of the spores giving trouble in the future. It is also advisable to avoid planting potatoes or tomatoes year after year on the same plot for the same reason. Our winter plots must be put more rapidly into shape now as the seeds will germinate more quickly during the next few weeks than when the ground is too cold. After the ground has been well spaded, manured and the plots leveled they should be well watered, and as the soil gets into condition it should be ready for sowing. The following may be sown or planted this month:

### Carrots

Sow for succession on well prepared ground in rows 18 to 20 inches apart, French Forcing and Danvers Half Long. By the end of the month those sown last month as advised will be ready for thinning at least six inches apart.

### Cabbage

If seed was sown last month there should soon be a fine stock of healthy plants to select from, and these may be planted out on the plot prepared for same on the first dull day. Plant at least 12 inches apart in the rows which should be two feet or more apart and water immediately after planting.

### Cauliflower

There is still time to plant these and they should be placed 18 inches apart in the row. They should be planted firmly and well watered after planting. Early Snowball is the best variety to grow and the soil should be heavily manured.

### Corn

Collect all the cobs saved for seed and place in canvas bags to dry. Dust maturing cobs of late crop with arsenate of lead to destroy corn worm.

### Lettuce

To maintain a successional supply sow Los Angeles and May King, also White Paris Cos which is a very popular variety and very hardy. Seed should be sown in rows 20 inches apart very thinly on rich soil.

### Celery and Leeks

These should still be given liquid manure twice weekly, and see that all stems are covered with brown paper covers for blanching. This crop will keep for many months in the ground, but if the plot is required for other crops this should be dug and stored in soil in the cellar.

### Beans

Collect all shell beans and store for winter use. The best winter bean to grow is the Broad Windsor, sown in rows two or three feet apart. This grows two feet high and has a wonderful flavor besides being very hardy.

### Kale and Brussels Sprouts

Plant these if they were not planted last month as we advised. They are both very useful and should be extensively grown. Plant at least 18 inches apart in rows which should be 30 inches apart on well manured soil. Water immediately after planting.

### Peas

Any of the early varieties may be sown, and it is essential that the soil be well prepared for this crop by trenching deeply. Sowing should be at intervals of three weeks or so from now on, and by this means a successional supply may be secured. Of the dwarf varieties the following are best to grow; Little Marvel, American Wonder, Premium Gem and Blue Bantam. Tall earlies are Gradus and Alaska or Thomas Laxton, three of the best. One pound of seed will sow a row 100 feet long. The rows should be two to three feet apart. They require plenty of water during the growing season.

### Beets

Sow thinly in rows 20 inches apart Detroit Dark Red and Crosby's Egyptian in rich soil. Later thin out to six inches apart. Store all matured roots for winter use in the cellar.

### Swiss Chard

Sow seeds of this useful vegetable in rows two feet apart. Giant Lucullus is the best variety. It is also excellent for poultry as green feed.

### Radish

Sow winter varieties Rose Winter

# Preservation of Grape Juice

By W. V. Cruess, Fruit Products Laboratory, University of California

THE impending shortage of refrigerator cars has caused a flood of inquiries to the University for information on the preservation of grape juice. There are four general methods of preservation that might be used. There are refrigeration, canning, bottling and preservation in barrels by the use of sulphurous acid.

The canning of grape juice has been investigated by the university with fairly successful results.

### Extraction of Color

The consumer seems to demand a red juice. Therefore, red wine grapes must be used, although these may be blended with an equal weight or less of white grapes. Crush and stem the grapes in the usual manner as for wine making, using grapes that are in sound condition, crushers and other equipment that is free and clean from mold or yeast. If the operation is conducted on a small scale, heat the crushed grapes in a tank equipped with coil or in a jelly kettle. Copper, tin or aluminum may be used Do not use iron. If the operations are on a very large scale run the crushed grapes into open vats and drain off as much of the juice as possible. Heat juice in tank equipped with steam coil, or in continuous pasteurizer and return hot juice to skins. By either method heat grapes to temperature of 140 to 150 degrees Fahrenheit to dissolve the color. Press at once in basket presses. Continuous presses cannot be used.

### White Juice

Where it is not desired to have a red color crush grapes but do not stem. Press at once in basket presses without heating.

### Clearing Juice

The coarse pulp can be removed from the juice by straining it through sugar bags, cheesecloth or burlap. Red juice may then be filtered through a wood pulp filter if a clear product is desired. A centrifugal clarifier can also be used for either white or red juice to remove most of the sediment. These are obtainable from the Sharples or De Laval Pacific Company, San Francisco or Los Angeles.

### Filling Cans and Exhausting

Fill the can with the strained or filtered or otherwise clarified juice. Heat the cans in steam until the juice in the center of the cans registers a temperature of 175 degrees Fahrenheit. An ordinary can exhaust box, used by commercial canners of fruit, is suitable for the purpose. If red juice is canned, the cans must be inside enameled. The Number 10 can is probably most suitable for the purpose. The cans should, if possible, be held at the temperature of 170 degrees Fahrenheit for about ten minutes before they are sealed. If the heated cans are placed to one side for ten minutes after they come from the exhaust box and before sealing this will accomplish the desired purpose, which is to remove all of the dissolved air from the juice.

### Sealing and Sterilizing

Seal the cans at once and as full as possible, following the ten minutes' heating at 175 degrees Fahrenheit, described above. Place the cans in water at 175 degrees Fahrenheit for an additional twenty minutes.

### Cooling

Chill the cans in cold water, or under sprays of cold water following the sterilizing process.

### Spoilage

Those who have canned grape juice in the past have found that it frequently corrodes the tin plate and may even perforate or eat holes in the tin plate, with subsequent spoilage. We have at the University found the same difficulty, where the heated cans were not heated for at least ten minutes before sealing and in the manner described above. The preliminary heating before sealing is vitally important.

### Bottling of Grape Juice

Tin cans impart a notice ble flavor to grape juice and if the natural flavor is to be retained it is best to bottle the juice. The preliminary treatment is exactly as described above for the canning of juice. The strained or filtered juice is filled into grape juice bottles, leaving a space of about one and one-half inches below the cap to permit expansion. The bottles are then sealed with crown caps, using either a foot power or hand power capper, or an automatic capping machine, according to the size of the plant. It is not necessary to heat the juice before sealing the bottles. Place the bottles in a tank of water, with bottles horizontal. Heat the water to a temperature of 175 degrees for 40 minutes. Bottles must be completely covered with water during the heating process. Count time only after water has reached 175 degrees. Draw off the hot water and allow bottles to cool.

### Pasteurizing in Barrels

Juice prepared as for canning can be preserved in 25 or 50 gallon barrels and shipped to the eastern market. New barrels must be used and only oak barrels are suitable. The barrels should be soaked out with hot sal soda solution containing about two pounds of sal soda to one hundred gallons. They should be soaked with hot water to remove soda and woody taste before they are used. Just before barrels are to be used to receive the juice, heat the interior very thoroughly with steam. Then heat the juice in a continuous pasteurizer, or in a tank with steam coil, to 180 degrees Fahrenheit. Fill the steamed barrel with juice at 180 degrees. Drive into the bung hole a wooden bung fitted with a clean piece of muslin. Both the muslin and the bung should be boiled at least ten minutes in water and should be taken out of the boiling water directly before use, in order that they will be sterile. Paint the barrel with shellac at once and roll on its side. Store in a cool place.

### Preservation With Suphurous Acid

The most convenient method of preserving grape juice in the average winery is by the addition of sulphurous acid. Prepare the juice as for canning. Cool it by artificial means if necessary to the temperature of the storage cellar, which should not be above 60 degrees Fahrenheit. Use clean puncheons, barrels, or tanks that are as nearly sterile as it is possible to make them. Barrels may be steamed; tanks may be washed out with metabisulphite solution, or sulphurous acid solution. As the juice flows into the barrels or tank add slowly a solution of potassium metabisulphite in water, or a 6 per cent solution of sulphurous acid. Potassium metabisulphite is dissolved at the rate of one pound per gallon of water. For a clean container

GMC

Model K41—Two Ton

$2375

*Chassis Only—At the Factory*

*GMC Chassis list at factory as follows: One Ton, $1295; Two Ton, $2375; Three and One-half Ton, $3600; Five Ton, $3950; tax to be added*

## Haul Stock This Fall With a GMC

Flashing along the good highways at a fast speed and also developing more pulling power in bad going than is averaged by trucks of like capacity, the Model K-41, Two Ton GMC truck, is the finest equipment yet produced for hauling stock and for other heavy work on the farm.

Like the "Jim-Dandy" one ton GMC, this truck has exclusive improvements that increase operating economy and reduce the time and expense of maintenance. Model K-41 is equipped with the GMC Two-Range Transmission, providing greater pulling power in combination with more road speed—a combination never before accomplished until the development of this distinctive feature by GMC engineers.

The Two-Range transmission has successfully multiplied economical engine power into greater power at the wheels and has opened up new fields for motor truck use, both in the city and on the farm. With this transmission a GMC truck will go anywhere that wheels can get traction and on good roads will speed 18 miles an hour with solid tires.

It has such other advantages as GMC Removable Cylinder Walls, Pressure Lubrication, Removable Valve Lifter Assemblies, Instantaneous Governor Action, Magneto Ignition, Conduit Wiring, Thermo-Syphon Cooling, Electric Lights and Generator, Provision for Starting Motor and many other refinements not usually found on motor trucks.

Write for an illustrated booklet "GMC Trucks on the Farm."

1872 GOLDEN JUBILEE 1922
Pioneers Together
—the staunch builders of this great country—and Montgomery Ward & Co., who first supplied their needs by mail.
Fifty years of progress together, and today this great new-old institution of Montgomery Ward & Co. is filled with the same spirit of the Pioneer—always progressing—always leading the way.
We enter our second half-century of service by offering you in this, our Golden Jubilee Catalogue, the fruits of fifty years' experience in making low prices on goods of dependable quality always.
Catalogue Number 97
MONTGOMERY WARD & CO.
Fall & Winter 1922 23

# Millions Buy from this Book on Faith in the Name "Montgomery Ward"

**Interesting stories from three of our oldest customers**

"I received my first Montgomery Ward price list in 1872, and I became a customer almost immediately. The catalogue has been coming regularly ever since, and I have been doing business with Montgomery Ward & Co. practically all of that time.

"I wish to state, that in all of those years there has never been any occasion to make a complaint or to return any goods we have ordered from Montgomery Ward & Co."

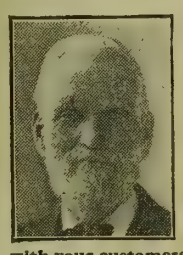
**William McCandless, Sloan, Iowa**
A Customer Since 1872

For fifty years, ever since Montgomery Ward & Co. was started, Mrs. Merrick has taken a keen interest in its development.

"I have been a customer from the first.

"I have always had the most courteous treatment from you," she said, "I believe that much of your success has been due to your unfailing policy of fair dealing."

**Mrs. Emma E. Merrick, Malcolm, Iowa**
A Customer Since 1872



Mr. Beatty is a real pioneer. He is the only man now doing business in Helena who came to Montana in 1862. He served under General Johnson in Utah (1857-8). He finally settled in Winston, Montana.

"I have traded with Montgomery Ward & Co. for 45 years," he said, "and I have never found anything wrong that has not been satisfactorily settled. If you continue to deal as fairly with your customers as you have in the past you will surely prosper."

**Mr. George Beatty, Winston, Montana**
A Customer Since 1877

This book is saving many millions of dollars for the American people.

Is it saving money for *you* and for *your* family? Are you taking *full advantage* of your opportunity?

This book—our Golden Jubilee Catalogue—celebrates our 50th Anniversary by offering you the lowest prices possible on everything for the Home, the Farm and the Family.

It is filled with bargains—with merchandise of high quality. And every price is a Money Saving price for you.

For Fifty Years Montgomery Ward & Co. have earnestly worked to serve the American people.

Today millions of people are buying from this book on faith in the name "Montgomery Ward."

And it is our policy to keep faith with our customers. It is our policy to sell only serviceable goods, to serve you promptly — always to offer you a saving — and to deal with you always in the full spirit of the Golden Rule.

Montgomery Ward & Co. begins its second half-century of business existence. Yet today it is filled with the spirit of youth; alert, looking ahead, improving its service, filling orders quicker, and offering lower and lower prices.

To buy from this Golden Jubilee Catalogue is to be guaranteed a definite saving and entire satisfaction—and back of this guarantee is the reputation of Fifty Years of fair dealing.

Buy from this book. Fill all your needs from this book. Consult it daily to find the right price, the lowest price for dependable, reliable goods of standard quality.

# Walnut Trees Too Close

ONLY five walnut groves out of 141 chosen at random, located in various sections of Orange County, which is the world's greatest walnut producing center, have the trees set as wide apart as they should be. This startling bit of information came to light when the California Walnut Growers Association announced the result of a survey which it conducted in Orange County last summer in cooperation with Farm Adviser Wahlberg.

Horticultural experts long ago arrived at the conclusion that walnut trees to produce the most satisfactory results should be set not closer than 60 feet apart. The wisdom of such a policy was recently proved by C. C. Teague, president of the California Walnut Growers Association, who announced that after taking out every other tree on his famous Limoneira Ranch he got heavier tonnage and better walnuts.

In the opinion of Mr. Teague most of the walnut groves in Southern California are crowded, and his conclusion is borne out by the result of the recent survey. He says that half the trees in many groves could be taken out with ultimate profit to the owner. The fact that the groves in Orange County, one of the best horticultural sections in the state, are badly cramped for room is conclusive proof that Mr. Teague speaks with authority.

The association in its survey assembled data concerning 141 walnut groves located in various sections of Orange County, representing 1,665.41 acres. These included 1616 bearing and 49 non-bearing acres. Five groves were set 60 by 60 feet, which is the proper distance; 69 were set 40 by 40; 20 were set 50 by 50; 9 were set 48 by 48; 11 were set 45 by 45; 7 were set 42 by 42, and the others, in single instances ranged all the way from 40 by 45 and 38 by 38 down to 30 by 30 and 24 by 24 feet apart.

W. T. Webber, salesmanager of the association, says that where walnut trees stand closer than 60 by 60 feet in the rows they do not get the necessary amount of sunshine and circulation of air. Association officials are agreed that if crowded groves are properly thinned, the net result for a year or two may be somewhat smaller than formerly, but the ultimate result will be greater in tonnage as well as in size and quality.

During the survey the association inspected 1309 groves in Orange County owned by 1239 persons. The average acreage per ranch is 12.42 acres. That Orange County ranks high in irrigation is indicated by the fact that 1285 groves, or 98.1 per cent of the total, are under irrigation, 24 being without irrigation facilities.

The production of these groves in 1921 was 16,746,346 pounds, an average of 1154.45 pounds per acre. The bearing walnut acreage of Orange County is 14,506.10. The non-bearing acreage, embracing trees under seven years of age, is 888.50, making a total acreage of 15,394.60 for the county.

The Santa Barbara Soft Shell variety leads in production. It makes up 56.67 per cent of the total acreage, which is 8,724.63. The Placentia comes next with 40.55 per cent, the acreage being 6,246.94. Eureka acreage amounts to 2.36 per cent, the Prolific shows .11 per cent, the Ehrhardt shows .12 per cent, Hardshells show .08 per cent, and Chase shows .07 per cent, with Klondykes credited with .04 per cent of the acreage.

According to the survey, 408 growers, or 33 per cent, use tractors exclusively, while 43 per cent use horses exclusively. It appears that 13 per cent use both horses and tractors, 4.4 per cent hire all their work done; and 28.7 per cent keep cost accounting records.

The survey just completed is, according to association officials, the most valuable compilation of information on the walnut industry which has ever been assembled. It was secured with the assistance of the Orange County farm adviser.

Similar surveys will be undertaken in Los Angeles, Ventura, and Santa Barbara Counties early next spring, the association says. It is hoped that these three counties can be fully covered during 1923. The complete result of the survey by counties, and the final report, will be available to the U. S. department of agriculture, the state department of agriculture, all county horticultural commissioners and farm advisers, and any other organizations having general interest in the walnut industry of this state.

# Peach and Fig News

By Ira J. Condit, California Peach and Fig Growers

It is difficult to estimate the dried peach crop of California this season on account of the variable conditions existing in the orchards. Some sections which delivered very few peaches last season are delivering large tonnages this season because of the difference in frost conditions this season and last. Some orchards which normally deliver excellent fruit are sending in a very poor quality of peaches on account of neglected conditions of the trees. It is probable that the expected large increase in tonnage will not materialize this season although the tonnage will be somewhat larger. On account of the slowness of the peaches to mature, the harvesting of the crop overlapped with that of grapes, making it difficult to handle the peach crop to the best advantage.

The peach market is not affected by importations since practically all of the peaches marketed in the United States are produced in California. The demand for the product continues strong. The use of the test grader has greatly facilitated deliveries of peaches and allows the grower to better observe the grading process. The fruit is classified as "A," "B" and "C" grades as soon as received at the packing houses and the returns made to the grower according to the percentage of each grade delivered. "A" grade includes all sound and properly colored fruit. "B" grade includes all peaches somewhat immature or slightly off color, while "C" grade includes the very dark, or slabby fruit. In test grading the sample of peaches taken from the grower's delivery is run over various sized screens and graded as follows: Standard, No. 34 screen; Choice, No. 42 screen; Extra Choice, No. 50; Fancy No. 58; Extra Fancy, all fruit passing over the grader.

According to latest reports, there are in California 107,786 acres of peaches in bearing and 22,518 acres, non-bearing with an estimated planting in 1921 of 6,057 acres. Fresno County leads in acreage with 25,150 acres in bearing and 1010 acres non-bearing. For several years past about 60 per cent of the California peach crop has been canned, 30 per cent dried and 10 per cent marketed as fresh fruit. The average production for the past 16 years amounts to 25,694 tons, the heaviest production being in 1917 with 39,000 tons.

### Figs

Naturally the most important event in the fig situation recently has been the debacle in Asia Minor and the destruction of the city of Smyrna. This will either completely cut off the importations of figs from that city or delay the crop for several months. The 1921 crop of figs in Smyrna was handled by nine houses employing 8,000 men, women and children. The crop consisted of 18,000 tons, of which 10,000 tons were sent to the United States. The two cent duty on figs does not prevent the importation of immense quantities of cheap figs from southern Europe, principally from Portugal and Spain. Ten days ago, Spanish tapnet figs were quoted in New York at 95 cents for 22 pound boxes. Such figs naturally compete with the

# To the Fruit Growers of California:

*By* J. E. BERGTHOLDT

Secretary and Manager of The Silva-Bergtholdt Company, Nurserymen, and one of California's most extensive growers of fruit.

YOUR MOST VITAL PROBLEM IS TO EDUCATE THE AMERICAN CONSUMER IN THE USE OF YOUR PRODUCTS AND TO EDUCATE THE RETAILER IN THE EFFICIENT DISTRIBUTION OF THESE PRODUCTS. THIS ACCOMPLISHED, EVERY ACRE IN CALIFORNIA THAT WILL GROW FRUIT, WHEN PLANTED, CANNOT SUPPLY THE DEMAND.

In my first announcement on "The Reason Why," I showed you that there were 44% less trees in orchard in the United States outside of California in 1920 than in 1910.

In my second announcement on "Another Reason Why," I called your attention to the evolutionary change in the diet of the one hundred and twenty million American people—consuming an ever increasing amount of fruit and vegetable products.

I showed you, also, that California, by reason of her natural climatic advantages, enjoys a practical monopoly in the production of the various articles of fruit food that go most largely into consumption.

REALIZING THESE FACTS, you, as a fruit grower of California, will be tempted to sit tight, in the anticipation that the decreasing competitive supply on the one hand and the increasing consumption on the other, will insure the prosperity of your business.

*But that won't work out in practice. Don't kid yourself.*

For example, if you were manufacturing a commodity which every person deemed an absolute necessity, the success of your monopoly would depend altogether upon the degree in which you intensively and intelligently exploited the sale of the commodity.

THIS IS AN AXIOM IN SELLING, AND ONE UPON WHICH EVERY SUCCESSFUL COMMERCIAL ENTERPRISE HAS BEEN FOUNDED.

## Publicity Needed for Green Fruit

During my thirty years' experience in horticulture, I have been a close observer of the marketing methods employed in the fruit industry. Your present co-operative marketing organizations are an evolutionary product of the experiences (and adversities) of the past.

All of these organizations, except the deciduous fruit (green fruit) shipping branch of the industry, are using a reasonable expenditure in intelligent publicity, a major portion of which is being employed in newspaper advertising.

It is a tragedy that the men constituting the heads of the various commercial fruit shipping companies and the California Fruit Exchange (green fruit) are so blind in their conservatism as to fail to see the advantage of the proper use of modern publicity methods. The products of this branch of the industry, constituting in value 20 per cent of the whole, are being marketed by means of the antiquated methods of a generation ago.

With the exception of the Pear Growers' Association, not one dollar is being spent in publicity toward increasing the consumption of these products. While the effort of the Pear Growers proved a modest experiment, it did demonstrate the efficacy and necessity of direct commodity advertising in green fruit.

Your various marketing organizations are all largely employing identical methods in their publicity.

## Bergtholdt Plan is Safeguard

A year ago, in announcing the Bergtholdt Plan to increase the consumption of your products and increase the efficiency of your retail distribution, I urged you to do your part toward getting under way this movement, which would absolutely safeguard the industry.

I covered the subject fully in four public announcements. I cannot afford to buy the space to reiterate what I then told you, although it is of vital importance to you. If you do not have copies of these announcements, write me and I will be glad to mail you a complete set.

The major portion of the advertising expenditures on the part of your various marketing organizations are employed in newspaper advertising, having a total subscription of approximately fifteen million.

In my announcements a year ago, I proved to you by authentic deduction that, granting these advertisements 100 per cent efficiency, your advertisements could reach but six million readers of the fifteen million subscriptions.

## Great Market Remains Undeveloped

Granting further that every one of these six million readers is a housewife, and that every one of the six million were prompted thereby to increase the consumption of your products—granting all of this—your present newspaper advertising, as now employed, is reaching but six million housewives out of the twenty million housewives of America. *How about the other fourteen millions?*

This is proof that newspaper advertising, though intensively employed, is inadequate to the task of influencing the whole.

Most of your organizations are publishing pamphlets, also, calling attention to the wholesomeness of their product and giving recipes for their use. I have been authentically advised that one of the most efficient of your marketing organizations, which has, for a period of years, made an intensive effort to distribute these pamphlets, succeeded in reaching, during these years, but three million housewives, and then only in a very fragmentary way. *How about the remaining seventeen millions?*

Most of your various organizations likewise employ practically identical systems of dealers' helps. The fact, however, that scarcely one in ten retailers exercises the efficiency in display and salesmanship of an average haberdasher, proves the inadequacy of these present methods toward increasing the efficiency of your retail distribution.

## Need for Greater Organization

By these statements I do not mean to detract from the great good that has been accomplished toward increasing the value of your products by the methods as now employed. The results realized, inadequate though they have been, are well worth the expenditure, and this method of direct commodity advertising and direct selling efforts on the part of the various organizations should by all means be continued.

These facts, though, do prove that your present methods are inadequate, and that the task of informing the one hundred and twenty million people of the United States and Canada of the attractiveness, the economy and the goodness of your fruit products; and the task of disseminating these products among the people of the civilized world, is so vast and stupendous that the means so far employed by your organizations, though efficient to a degree, are totally inadequate.

I REITERATE TO YOU THIS FACT—*the American housewife, of whom there are twenty millions, and the public eating house absolutely control the consumption of your product; and the retailer is the agency upon which you absolutely rely for its intelligent distribution.*

NO ONE ORGANIZATION ALONE IS BIG ENOUGH FOR THE TASK; COLLECTIVELY IT CAN BE PUT OVER.

Even if one of your organizations, by enormous expenditure and intensive effort, did accomplish the task, do not lose sight of this one great economic truth; that no branch of the industry of itself will prosper for long alone.

The organization designed to put over the Bergtholdt Plan must be commensurate with the vastness of the fruit industry of California.

## Market Expansion Object of Plan

This organization, in its direct appeal to the housewife, should create a book unlike any other publication or cook book, so edited and compiled as to fascinate and hold the interest of the housewife. It should embody suggestions as to the hygienic wholesomeness, the attractiveness and the economy of your products—so sincerely written as to be absolutely convincing; and, most important of all, it should contain a code of recipes compiled by the best expert culinary talent in the country. The book should be simple, wholesome, attractive and labor saving—a book de luxe, a gift that by its intrinsic value, its attractiveness and romantic interest, will be forever appreciated for its practical usefulness, and an indispensable necessity to every housewife.

This organization should, if possible, place a copy of this book in the hands of every one of the twenty million housewives of America, and should devise methods of publicity which will keep this book a live issue in every household.

## Development of Foreign Markets

This organization, by means of this book printed in foreign languages, should function toward increasing the consumption of your products in the export trade. Other methods should be evolved for developing foreign consumption.

This organization, in a department created and manned for the purpose, should function to increase the consumption of your products on the part of the public eating house.

Most important of all, this organization assisted by the best advertising and salesmanship talent that can be engaged, should function in a department of aid to the retailer with the definite object of increasing the efficiency of your retail distribution. It should evolve a system by which the co-operation of the retailer is obtained toward keeping the book a live issue with the housewife. It should evolve plans for inducing the retailer to SPECIALIZE in the sale of California fruit food products in a SEPARATE DEPARTMENT. It should evolve efficiency methods in merchandising, display and salesmanship; in other words, it should function to make every retailer and retailer's clerk an efficient specialist in the sale of your products.

## Fruit Growers Must Act

In the present status of the situation, it is up to the management of your organizations to create a preliminary organization. The functions of this organization will be, first, to secure by means of publicity, the support of every fruit grower outside of the organized branches of the industry, the aid of every factor engaged in the handling and manufacture of fruit products and of all allied industry; secondly, by publicity and a financial drive, equitably prorated, to OBTAIN THE NECESSARY FINANCIAL SUPPORT TO PUT THE PLAN OVER.

In the final analysis, however, it is absolutely up to you, the individual fruit grower, to set aside every other consideration and bring your influence to bear upon the management of the marketing organizations with which you are connected, to take action that will get this effort under way.

Your annual contribution to the cost of putting over the Bergtholdt Plan will be repaid to you, tenfold, each year in the increased value of your product. Every year that you defer you suffer, in depreciated values, many times the expenditure.

The consummation of this Plan will absolutely insure to you the permanence, the growth and the prosperity of the fruit growing industry, and through it, of California.

*This is the third angle of my story, and the most vitally important. It is now up to you!*

J. E. Bergtholdt

Secretary and Manager,
The Silva-Bergtholdt Company, Nurserymen,
Newcastle, California

S-02:10-3

---

California Adriatics for cooking and bakery grade.

The California crop is being rapidly harvested and prepared for market. There is expected to be an increase in the tonnage of Mission figs but a decrease in Adriatics on account of frost damage to the trees last season. The canning of fresh Calimyrnas has withdrawn a considerable tonnage of this variety from the dried fruit market.

The three fig canneries operated by the association have practically completed the season's run and have handled about 1000 tons of Calimyrna figs and 150 tons of Kadota figs. The picking of the fruit has been handled principally by the association and picking costs have, in most orchards been reduced to the minimum. Since Calimyrna figs dry down about 3 to 1, the first returns are regarded very favorably by the growers in comparison with the returns received from dried figs.

### N. B. F. O.

The semi-annual conference of the National Board of Farm Organizations has been changed from October 3-5 to October 11-13. Several of the state farm organizations affiliated with the board are to hold their conventions during the week prior to October 11, and it is believed that a more representative attendance will result from the change in the plan for holding the conference.

# This Month in the Ornamental Garden

## Southern California

By Ernest Braunton

OCTOBER should be the busiest of the autumn months in the garden, a time of unusual activity. It is the month of first bulbs and for a long list of annual and perennial seed sowing. Bulbs need a deep, well pulverized rich soil, but containing no fresh animal manure. It is almost unnecessary to state such soil is very good for nearly all plant life.

The list of bulbs for present planting is: anemone, calla, cyclamen, freesia, gladiolus (dwarf), hyacinth, ixia, jonquil, lily, montbretia, narcissus, ornithogalum, oxalis, ranunculus, Spanish iris, sparaxis, tritelia, tuberose, tulip, Watsonia. The last, with freesia, are as well planted in September and should therefore be planted at once. Tuberous rooted begonias, that now are dormant, may be planted in pots, to be kept in house for spring flowering.

### Seeds to Sow

There is no flower that stands frosts better than calendula and when no other flowers are available through effects of cold weather, the calendula proves its value. Sow the seeds now. The following are also in order: acrolinium, alyssum, antirrhinum, bartonia, bellis, candytuft, carnation (annual), clarkia, collinsia, coreopsis, centaurea, cosmos, chrysanthemum (annual), cornflower, godetia hunnemannia, larkspur, linum, lupinus, mignonette, myosotis, nemophila, poppy (all kinds), phlox, primrose, pansy, petunia, scabiosa, schizanthus, stock, statice, sweet pea. A collection of native flowering plants, both perennial and annual, should be added to the list. A little South African daisy, by the almost tongue-defying name of dimorphotheca should not be left out. It comes in orange and shades of yellow.

### What to Avoid

Things to avoid are those flowers which fairly revel in hot weather and those easily injured by frost, also some that require dry treatment. Nasturtiums are subject to all these conditions and are best left for spring sowing unless one has a "hot" spot in a frostless section. The true marigolds have just flowered as they keep company with the zinnias, therefore they are better as autumn flowers. Yet in California they are, like coreopsis, sown throughout the year. It is now somewhat late for sowing seeds of pansy and cineraria and it would be better to secure plants.

### Flowering Shrubs

One may now begin to garden seriously in all lines, so that ornamental trees and shrubs are in order. The first of shrubs for all California is probably abelia; it is a jewel that grows but four feet high. Today the red berried shrubs are very popular and one may plant quite a list. Of the taller ones none is finer or more fruitful than Cotoneaster pannosa. Pyracantha coccinea and its variety Lalandi are equally good for berries. Several species of crataegus will also find a place in good shrubberies and as not all of these are in ripe berry at the same time, a variety is desirable.

Other good shrubs are: Buddleia magnifica, a blue flowered semi-herbaceous (not hard wood); myrtle coronilla, hypericum (best in semi-shade); hydrangea, aucuba and mahonia are also for shady spots. Of shrubby acacias A, cultriformis is the best for both flowers and foliage. Our native "wild lilacs," the ceanothus, in several species, are worth space in any garden. For dry places the Australian bottle brushes are excellent. Where foliage and not flowers is desired, Coprosma Baueri is very fine, especially at or near the coast. Duranta Plumieri is fine for blue flowers. Nandina domestica enjoys heat, yields white flowers and scarlet berries. Of the brooms one known as Genista fragrans is our freest flowering shrub with yellow flowers; the Spanish broom almost makes a tree and will grow in driest spots.

## Northern California

By A. R. Gould

OUR thoughts are now directed to obtaining the best supply of winter bloom, and to do this we have to arrange our beds and borders very carefully as doing things by chance in the garden rarely gets one anywhere and our seeds must be sown at the right time to produce flowers accordingly. We have to plan ahead so that we shall have something seasonable. This is also a good time to move shrubs. One word of warning, when moving shrubs have the soil around them as dry as possible and get a good ball of earth which should be moved intact and see that your hole is large enough before moving and water immediately the shrub is planted, not forgetting to plant with manure.

Take care of the lawns and continue to dress them with fertilizer to take out the brown spots and stimulate, and by all means keep the weeds out. It's a perpetual job but very necessary to secure a nearly perfect lawn. All vines will need attention as the long growths must be tied in and dead wood removed. Dig manure in to the roots of these and water well. Rose bushes may be pruned and the ground well cultivated around these when it will also be a good plan to apply good, farmyard manure.

### Chrysanthemums

These will soon be giving a wealth of bloom and should be shaded from the strong sun and the plants watched carefully for aphis and red spider, but avoid contact with any buds showing color. Feed twice weekly with liquid manure and complete the staking of the plants.

### Bulbs

These are invaluable for winter and spring bloom, and there is such a wide selection that almost every shade can be secured especially among the tulips. Among the earliest bulbs are freesia, crocus, snowdrop and narcissus, and these should be planted without delay, while the blue bell, Scilla Campanulata, a charming flower may also be included. The ground should be well prepared for planting and only the best quality bulbs planted. These should be purchased from a reliable dealer and a glance through the bulb catalog will enable you to select the varieties you need.

### Sweet Peas

The winter flowering types of these are now a very important feature of our winter display, and some charming colors may now be secured which will provide bloom for many months. The ground should be well trenched and watered before the seed is sown.

### Alstromeria

This golden lily from Peru is one of the best cut flowers we have and massed in a group for the border it is very effective. It will thrive in any good garden soil and may be planted any time this month.

### Ranunculus

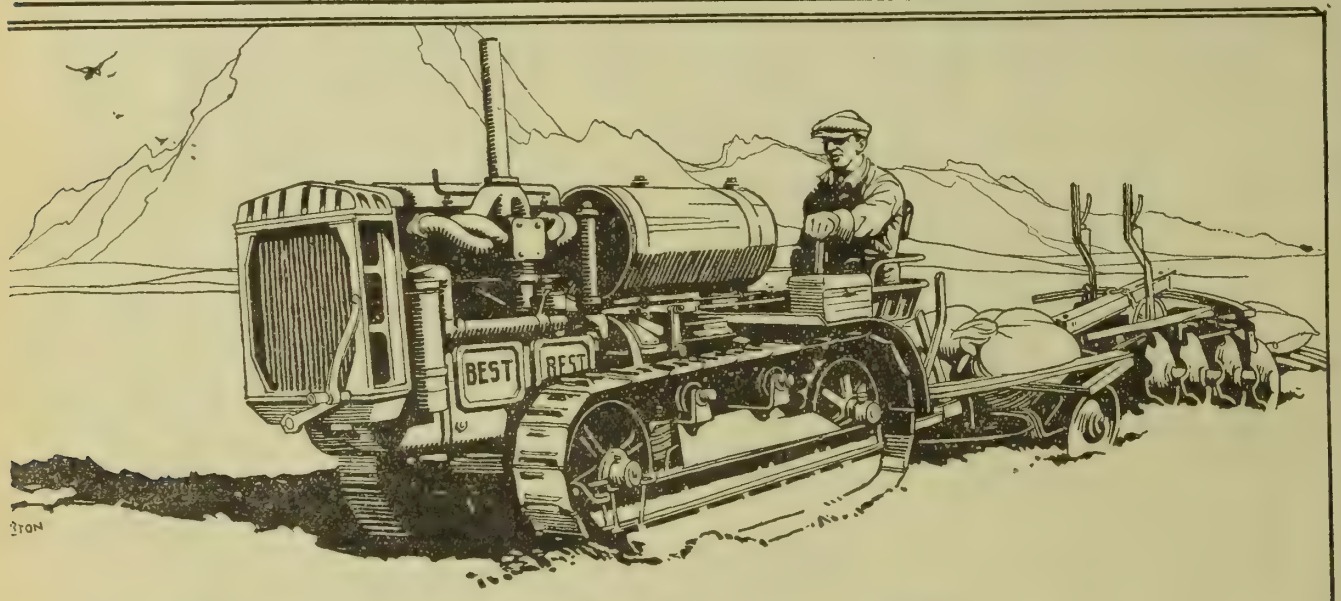
For early spring flowers no garden can be complete without them, and among the French mixed strain are some very beautiful colors. Bulbs of these may be planted now about six inches apart.

### Flowers to Sow at Once

Complete the sowing of foxglove, canterbury bells, English daisy, forget-me-not, snap dragon, viola, pansy, columbine, clarkia, godetia, nemophila, primula, cineraria, alyssum, bartonia, calendula, California poppy, stock, lupine and Sweet William. Sow these on the seed border and transplant with the exception of nemophila and California poppy which should be sown where they are to flower.

### Oxalis

These wonderful little flowers may



# Bigger and Better Crops

One of the greatest aids in increasing yields, is a GOOD tractor—the BEST kind of a tractor. Deeper tillage—better cultivation, produce bigger and finer crops, but it takes power of the right sort to handle this work satisfactorily. Best Tractors have that power. Plowing and other field work can be done rapidly—24 hours a day if necessary—and done more thoroughly and efficiently. Every advantage of weather can be utilized for better yields—then there is a saving in time, labor and hired help.

The right tractor will perform faithfully and economically. Such a machine should havemore power than is required; should be more than ordinarily well built; should be just a little better and more substantial than seems necessary. Such a machine is the right one. It represents the true ideal of all successful industrial mechanical power—real worth, built to meet fully all requirements in its field.

Best tractors have earned a splendid reputation for faithful service at low cost, for dependability, for power, for stamina. For years farmers have been depending on Best Tractors for better crops, the kind that pay dividends.

There are two models of Best Tractors, the "Sixty" and the "Thirty."
Write for catalog and full information and name of your nearest dealer.

BEST TRACTORS

be had in pink, lavender and yellow and should be planted in fairly rich soil 8 inches apart.

## Southern Arizona

By M. E. Bemis

THE calendula is a hardy annual which grows to about one foot in height and with its colors, varying from palest ivory to a deep orange, is a fine plant for borders. A moderately light, rich soil is best for this attractive plant although it will grow readily almost anywhere. It is also well to plant them about eight to ten inches apart if planted in masses.

The candytuft, with its clusters of small white, crimson, carmine and lavender flowers, is good for edging beds. This hardy flower should be planted in good rich soil with plenty of water. The flowers will be larger if a few of the buds are removed.

Daisies are hardy perennials which bloom during the early spring and well into the winter, giving forth a profusion of many colored flowers. This is an easily cultivated flower.

Petunias are popular because of the ease with which they are grown. The seed should be scattered thinly on an even surface and barely covered with sand or fine mulch. The tender plants give forth a profusion of blossoms ranging from white to almost purple. They are fond of sunshine and will prove most attractive in beds and masses.

The extreme easiness of cultivation of poppies entitles them to a place in every Arizona garden however large or small. The seeds should be sown rather thinly in a sandy loam; they should then be covered very lightly as they are small. They grow to a height of 2 feet.

The Spencer sweet peas are easily grown in a variety of brilliant colors. Select a place where plenty of sunshine will reach the plants and dig a trench 18 inches in depth and about two feet wide. In the bottom of this trench put about three inches of well rotted barnyard manure, then mix a sprinkle of manure and commercial fertilizer with the dirt already removed and replace in trench. Open a trench across the bed about six inches deep and plant one ounce seed to every 15 feet. Cover the seed with about one-half inch of soil. Fill the last trench with water, soaking thoroughly; then follow with a sprinkle of fine manure to prevent the earth surface from crusting. After the peas have grown to eight or ten inches begin to draw the dirt toward them, gradually filling the planted trench. At a distance of about 10 inches from the row open a trench through which they may be irrigated through the rest of the season. After the peas are 12 or 15 inches high a mulch of fine manure should be put on the bed and gradually worked into the soil. The plants should be kept well watered, and it is well to cut the flowers each day while they are blooming so as to prolong the blossoming period.

### SMYRNA FIG AND RAISIN CROPS

Government officials in Smyrna have a lot of trouble checking up export figures, particularly with regard to figs. Although the total production of figs for 1921 was officially recognized at 44,950,000 pounds, the actual exports reached a total of 51,193,000 pounds. This difference of over 6,000,000 pounds is accounted for by the shipments from certain unscrupulous exporters who deliver "hordas"—culls—in place of figs.

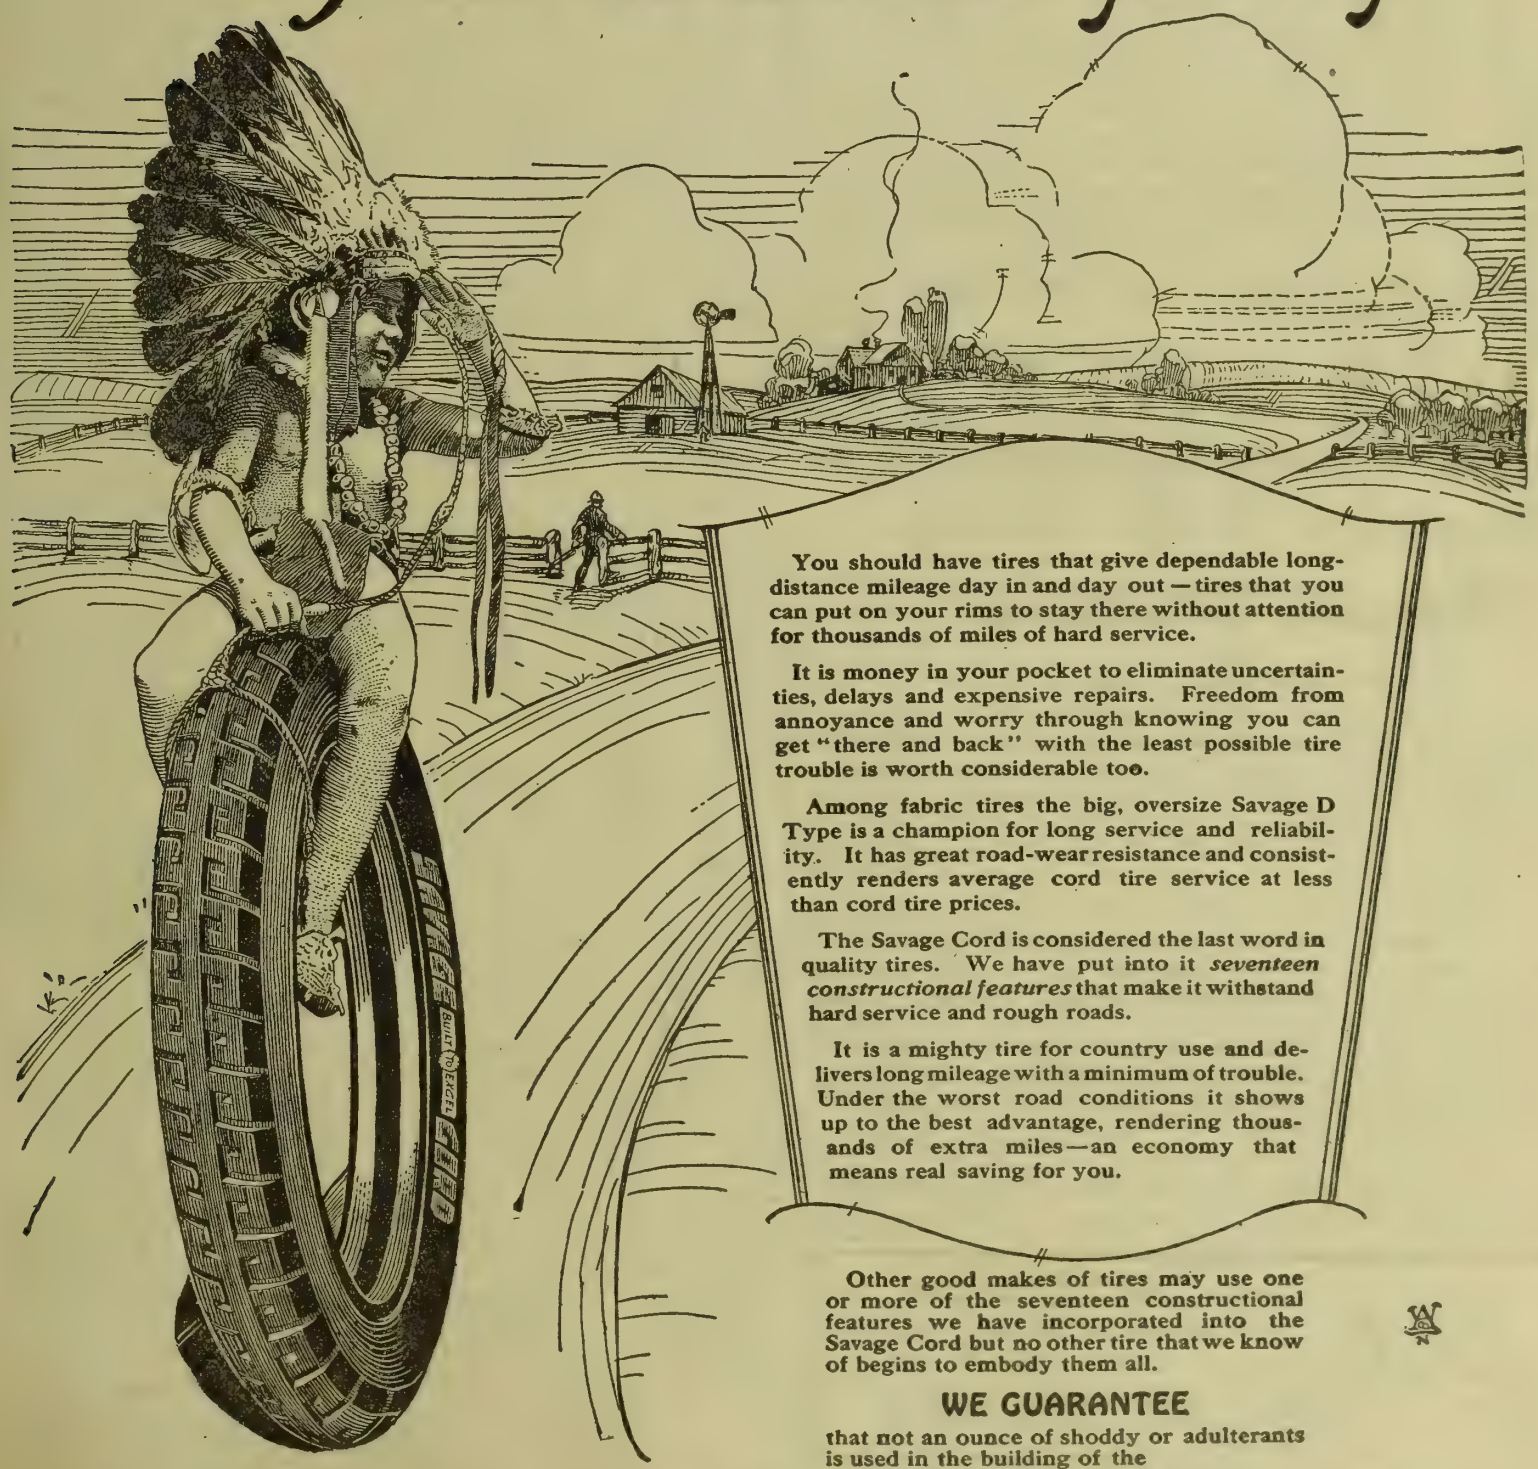
It is believed that this year's crop will be between 50,000,000 and 55,000,000 pounds. However, if the expected rain fails to come this crop will be reduced to between 37,500,000 and 42,500,000 pounds. The expected rain also will affect the raisin crop similarly.

The "currant" crop of Greece for this year is expected to be only about half as large as the previous yield.

*Look for*

**GREATER MILEAGE**

*from the next tire you buy*



You should have tires that give dependable long-distance mileage day in and day out — tires that you can put on your rims to stay there without attention for thousands of miles of hard service.

It is money in your pocket to eliminate uncertainties, delays and expensive repairs. Freedom from annoyance and worry through knowing you can get "there and back" with the least possible tire trouble is worth considerable too.

Among fabric tires the big, oversize Savage D Type is a champion for long service and reliability. It has great road-wear resistance and consistently renders average cord tire service at less than cord tire prices.

The Savage Cord is considered the last word in quality tires. We have put into it *seventeen constructional features* that make it withstand hard service and rough roads.

It is a mighty tire for country use and delivers long mileage with a minimum of trouble. Under the worst road conditions it shows up to the best advantage, rendering thousands of extra miles—an economy that means real saving for you.

Other good makes of tires may use one or more of the seventeen constructional features we have incorporated into the Savage Cord but no other tire that we know of begins to embody them all.

**WE GUARANTEE**

# Penetrates, Pulverizes and Packs--Better--

# It's Flexible-

John Deere Disc Harrows are noted for keen penetration and thorough pulverization, and, in addition, **they pack the soil better** than any other disc harrow **because they are flexible.** Soil packing fills up the air spaces and conserves the moisture.

## JOHN DEERE
## MODEL "B" DISC HARROW

**It's flexibility makes it do a better job of disking**—the gangs are independent of each other. By means of a third lever, pivoted yoke and **unusually powerful** spring, the inner ends of the gangs of the John Deere Model "B" DiscHarrow can be given light pressure for soft ground or ridges; heavy pressure for hard ground or for going down into dead furrows and depressions. Each gang can be angled properly to prevent harrow from crowding to one side when working on hillsides and when overlapping hard and soft ground.

**Unusually strong.** All steel main frame; double bar gang frames; riveted; convenient grease cups and spring steel oscillating scrapers.

**A way to save money.** Buy a Model "B". Use it with your horses. Later on, if you buy a tractor, you can convert the Model "B" into the popular John Deere Pony Tractor Disc Harrow by buying only a rear section andthe proper hitch. Then you will have a harrow that you can use with either tractor or horses—an advantage that often saves much time and money.

**FREE BOOK.** Write today, address John Deere, Moline Ill., and ask for a copy of free booklet describing the John Deere Model "B" and Pony Tractor Disc Harrows. Ask for Booklet DB-76.

THE TRADE MARK OF QUALITY. MADE FAMOUS BY GOOD IMPLEMENTS

# Herbicide Kills Weeds Cheaply, Effectively

**Satisfaction Guaranteed**

Destroys, **absolutely,** all pest weeds, noxious grasses, vines, shrubs, including Johnson, Bermuda, Morning Glory, Crab, Nut, Bronco, Water Grasses, Malva, Thistle, and all other noxious plants.

Herbicide is a triumph of modern science. It is a combination of chemicals, which, when sprayed on the foliage, permeates the entire sap system of the plant, and kills it root, branch, seeds and all. Inasmuch as the seeds, also, are killed, your next season's crop of weeds will be lighter and eventually you will banish them entirely.

Herbicide is extremely economical and easy to use. Does not require a professional sprayer. Far cheaper and more effective than hand labor with a hoe. To save freight we ship in concentrated form—one gallon makes ten gallons of spray. This is one of the reasons why Herbicide is a more economical spray to use.

Herbicide is tried, tested, proven. It cannot fail to remove noxious weeds in the cheapest and most effective manner known. **Now is the time to kill them.** Enrich your land by removing worthless weeds which sap the soil.

Write for prices, today.

### Spring on Government Land

Is there any way by which I can file on or hold water diverted from a spring rising on government land?—Subscriber, Cahuilla.

Water can be thus appropriated by the usual method of filing notice of appropriation setting forth number of inches desired and thereafter making actual diversion and beneficial use of the water. Since the appointment of the water commission it would be necessary for you to obtain the permission of the commission to make this diversion. Write to the water commission at Sacramento and it will send a deputy to investigate and award a permit.

### Grain Sacks

I sold through an exchange wheat and barley. Three-fourths pound was deducted from the wheat for each sack, yet they kept the sacks. Could I do anything about obtaining the value of these sacks?—Subscriber, Hanford.

Doubtless deduction was made for weight of sack under net container act. As it is probably assumed that the sack weighs three-quarters pound the price paid probably included the value of the sack. In any event in view of the fact that the money was offered in full payment for the shipment and received by you it probably would be considered that it was in complete accord and satisfaction.

### Naming Child

Is it compulsory to name a baby born in a hospital before leaving the hospital?—Subscriber, Stockton.

The act providing for the gathering of vital statistics requires that there be filed a certificate of birth which shall contain various items, among which is required to be given the full name of the child. It is however, provided that if the living child has not been yet named at the date of filing of certificate of birth a space for the full name of the child may be left blank to be filled out subsequently by a supplemental report. The hospital doubtless did not desire to be troubled with the necessity of filing such supplemental report as penalties are provided in case the full provisions of the report are not complied with. But it is not compulsory to name a child prior to taking it from the hospital.

### Rented House Damaged

I leased a house for a year, rental payable monthly. Tenants absented themselves on a vacation. When they returned they found that water boiler had burst by reason of excessive pressure turned on by the city for fire purpose. The house itself was badly soaked and considerable damage done tenants' furniture. Who will have to stand the expenses of repair and damage?—Subscriber, Anaheim.

Unless there was some provision concerning liability for repairs the lessor is not bound to make ordinary repairs and is not liable for damages caused to the goods of the tenant. On the other hand the tenant would be under no obligation to make repairs to the house and would be entitled to cancel his lease if within a reasonable time after notice of the damage the lessor has failed to place the house in a condition fit for occupation or at the option of the tenant, if the costs of repairs do not require an expenditure greater than one month's rent, he can after such notice repair to the extent of a month's rent and deduct the expenses of such repairs from the rent.

# Questions and Answers

**Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.**

### Pruning Tokays

What is the best method of pruning Tokay vines that have been frozen back? If grape vine has been headed so the crown is near the ground will the crown ever be any higher?—Subscriber.

The pruning of frosted Tokay grapes is much the same as that of other varieties which are not pruned to canes, the main idea being to select fruit wood which will preserve the form of the vine and produce a satisfactory crop. It is impossible to describe just how this should be done as each vine presents an individual problem. Do not use the quick growing sucker wood which often follows a severe freeze unless that wood is growing in the proper position that it may in two years time make a satisfactory arm or spur. Grape crowns that have been grown too near the ground may often be raised by using a short stake to which a well placed cane may be tied upright and a new head formed, the old arms below being removed gradually after the new head is able to take care of the growth.—F. K. H.

### Stemming Raisins

We dry our Thompson Seedless grapes for home use and find it a very slow and tedious task to remove the raisins from the stems, either before or after drying. Is there any machine on the market for doing this work, suitable for family use? If so where can one be obtained?—Subscriber, Hemet.

We know of no small machine which could be conveniently used for the removal of cap stems from Thompson Seedless raisins. This operation is accomplished in packing plants on a large scale by very rapidly revolving fan-like blades enclosed in a coarse screen cyinder. The blades throw the raisins violently against the screen and the stems are snapped off and are carried away by water. Less difficulty in removing the stems will be experienced if the raisins are very dry, after which a little rough usage or shaking around in some sort of container or rolling between the hands will accomplish the desired result. After removal the cap stems may be separated from the raisins by a blast of air from an electric fan. Perhaps some reader may have a better plan than this.—F. K. H.

### To Ripen Blackberries

I am raising Himalaya blackberries. This year at least 40 per cent will not get ripe. They are very large and red but will not ripen any further. They are getting irrigated once a week. Any information will be appreciated.—Subscriber, Oxnard.

Try withholding water and at same time make application of some form of potash.

### Market for Mustard Seed

Kindly tell me if there is any market for mustard seed. If so where.—Subscriber, Hamilton City.

Yes, the mustard seed market of the country is Ventura in this state. This being the center of its production, the larger buyers have located there.

### Orchard Queries

What is the best method of pruning six year old almond trees that were cleft grafted over to plums last spring. What is the remedy for slugs on cherry trees? Is it practicable to work over six year old orchard of almonds to plums? Is it best to graft or bud? Will it harm cherry trees to irrigate twice a month where alfalfa is grown in the orchard?.—Subscriber, Lodi.

Not knowing what shape your grafts are in, it is rather difficult for us to advise as to best method of pruning. In a general way we would say to prune them back so as to make them thicken up and thus form the proper foundation for the future head of the tree, also cut out any unnecessary or interfering limbs.

If the slugs are numerous, we would suggest calling on the horticultural inspector of your district, who will no doubt look over your trees and advise you just what is best to do.

It depends on the condition of the orchard. If it is vigorous and on suitable soil it might pay to work it over, but as a rule we think it best to pull out the old trees and plant new ones of the variety wanted.

Grafting is more desirable than budding in working over deciduous trees.

If your soil is of a sandy nature, deep and well drained, it may not harm your cherry trees to irrigate as often as you mention, but as a general practice we would not recommend such frequent irrigations.

### Loans from Stock Land Banks

Can you give us any information how to go about getting a loan from organization of Pacific Coast joint stock land banks?—Subscriber, Pomona.

The best way is to get in touch with the federal farm loan association. One such association covering Southern California has its offices in Los Angeles. However the Southern California branch of the joint stock land bank is maintained at the office of Bank of Italy in Los Angeles.

### Pear Blight

I am sending you a limb of a pear tree planted a year ago last February. Is it affected with blight? Otherwise the tree is growing and doing well. What is there to do?—Subscriber.

A case of pear blight; sometimes called fire blight. No spraying is effective. Cut out and burn all affected parts. See article by Jas. Mills Jr. in Cultivator of February 12, 1921, Page 197.

### Layering Loganberries, Etc.

When is the best time to cover the tips of Logan and Cory Thornless to make rootings?—Subscriber, Dunlap.

During growing season. Usually the rank growing vines will fall to the ground and falling leaves with cultivated soil will cover and root. Do not reset till dormant season.

### Wooly Aphis

A few choice apple trees are affected with something resembling cotton on limbs, with millions of little lice. Nearly all apples this year are wormy. Also a little bug about one-eighth of an inch long works inside of the apples. Will you tell me how to get rid of these pests, what spray to use and when to spray and how often to spray?—Subscriber, Whittier.

Your apple trees are infested with wooly aphis and the fruit with codling moth. Any of the soap or oil sprays will control the aphis in the tops of the trees but they will probably appear again the following year as they breed in the roots of the tree and on old trees it will be found extremely difficult to eradicate those on the roots. There are a number of parasites that hold the aphis in check. It is possible to control the codling moth by consistent spraying with poisonous sprays. The following spray is recommended: Lime three pounds, Paris Green one-quarter pound, water 50 gallons. Dissolve the lime and Paris Green and all the water. Spraying should be done just after the blossoms fall and before the calyx cups close and must be applied under a heavy pressure so as to fill each cup with the solution. Follow this with a second spraying about three weeks later

Exide
BATTERIES

Delivering the goods

The horse is being driven closer to his stable; the gas truck (started and lighted by an Exide Battery) goes on long hauls; and through the great zone in between, the electric street vehicle is coming into its own. Propelled by an Exide Battery, it delivers the goods — with least trouble and most economy.

You will find Exide Batteries playing an important part in all manner of industries. Exides supply current for the telephone system; they run mine locomotives, operate railway signals, and propel a majority of the world's submarines beneath the waves.

Rugged, simple Exide Batteries supply the current for most of the farm light and power plants, and they are famous for lasting for years without getting out of order.

You are, perhaps, most interested in the Exide built for starting and lighting your automobile. It is known as *the long-life battery*. It keeps its dependable power so much longer that it is not merely a great convenience but is the most economical battery to buy.

Exide BATTERIES SERVICE STATION

The nearest Exide Service Station has a battery the right size for your car. If your present battery needs repairs, no matter what make it is, it will be repaired skillfully and reasonably. If not in your telephone book, please write us for the address.

When Writing Advertisers Please Mention the Cultivator.

and a third two weeks after the second. It is recommended that a spreader of flour paste at the rate of three pounds to 50 gallons of water be used in the second and third applications. This will give the fruit and foliage a coating of the spray that will kill all the worms present. A band of cloth or burlap tightly wrapped around the trunk of the tree will prevent the worm from coming up from the ground but should be taken off every week or ten days and all worms that have collected under it destroyed. If you will take the matter up with the horticultural inspector of your district he will no doubt be glad to advise and assist you in the work of cleaning up your trees.

### Water-Logged Walnuts

I have recently lost three walnut trees eight years old. The first grew on land where water table is six feet below surface. It had just begun to leaf out well when the leaves withered and tree died. When we dug the tree the soil had a peculiar odor and after, when tree was cut into stove wood, it smelled very sour. The second stood on higher ground and withered and died slowly. Another still has a few green leaves but will die. Trees were budded on northern black walnut stock and were fine trees. Did the fact that we had 28 inches of rain have anything to do with condition of trees?—Subscriber, Fallbrook.

A clear case of stagnant water about roots. Walnuts will be short-lived where water level is six or eight feet below surface. The 28 inches of rain certainly was a factor in hastening death.

### Kadota Figs?

Can you tell me what ails my fig trees? I have two Kadotas planted in 1921 which have made wonderful growth and this year were loaded with fruit, but they fall off when as large as marbles. A white Adriatic next to them matures fine fruit—Subscriber, Glendale.

It may be as well that the first year's fruit fell off for the strain on the young trees would be too heavy for first year when all vigor should go into tree growth. But we suspect your Kadotas are Calimyrnas and would next year get some wasp-bearing Capri figs in June. When figs are mature the Kadotas and Calimyrnas are quite unlike and easily recognized.

### Nematodes

Commenting on control of nematodes through chemical fertilizers, especially nitrate of soda, Dr. Snowden writes: "I thought you would be interested to see the fine work done by nitrate of soda on the only test we have now running on nematodes. I tried a plot with check plot and the beets are practically gone on the untreated plot, while the nitrated plot (400 pounds nitrate of soda per acre) is thriving.

Beets will, of course, stand a heavier application of nitrate of soda than will orchard trees. However, we believe there would be no harm in applying at the rate of 400 pounds per acre. 300 pounds is a common application, though usually applied in three different lots in one season. However, it would perhaps be well to have a care to secure perfectly even distribution where large quantities are used.

### Roof Paint

Can you give me formula for making good graphite paint for shingle roof; also for wine colored stain for siding? What should be the cost per gallon for each?—Subscriber, Upland.

Dry graphite for use on roof is usually mixed at the rate of about 3 pounds to each gallon. There is such a wide range of oils and an equally wide range of prices that it is hard to know what is best to recommend. Some will even use distillate and mineral oil. More prefer fish oil, while some still insist on the old-time raw linseed oil mixed with a little kerosene in order to secure greater penetration. Kerosene gives better results than distillate. Where raw linseed is used three quarts to one quart of kerosene makes a good roof stain. Instead of the graphite one may use Prince's Metallic. It is somewhat cheaper than the graphite which costs 7 or 8 cents. The cost of the paint can only be figured out in your own locality after inquiry as to linseed oil quotations. There are some excellent and very cheap roof paints now manufactured which may be bought ready to apply. For the wine colored stain the Prince's Metallic with the addition of a little lamp black might answer, but unfortunately that material varies greatly in color, sometimes being almost yellow and again a distinct red. In case you cannot get a good red, then an even better wine color may be secured by using Indian red with a touch of lamp black as needed.

### Best Apricot

I would appreciate your opinion as to the advisability of planting Moorpark apricot trees in this locality. The soil is river bottom sediment and very fertile as we have wonderful alfalfa upon it. Also would you advise planting Tilton apricot, or what variety? Please give reasons for your selections as we contemplate planting this spring.—Subscriber, Orland.

These questions must be answered by each community. There are some sections where the Tilton has done remarkably well. For instance, see cover illustration on last week's Cultivator. This is a Tilton tree, grown in Hemet, Riverside County. The Tilton has also done well in some portions of the southern end of the San Joaquin Valley. Many say that the Moorpark is absolutely the most perfect apricot grown. It certainly has a remarkable flavor and is of a large size, but it has a reputation for being a shy bearer. Possibly at Orland it might bear well. Orland apricot growers can answer as to best variety for that section far better than can one at a distance. We will appreciate it if apricot growers will write in of their experience or opinions.

### Mealybug

A prize Norfolk Island pine surrounded by ornamental grapevines and shrubs is infested with mealybug. There is also a smaller (white) scale and the vines are infested with red spider. What is the best spray?—Subscriber, Los Angeles.

For the mealybug it will perhaps be best to spray with miscible oil spray. See special spray number of the California Cultivator, September 24, 1921. For the red spider, dust thoroughly with sulphur or sulphur and hydrated lime. However, as a further suggestion, we may say that the cryptolaemus, beneficial insect introduced a few years ago, would prove helpful in control of this pest. The "crypts" are being distributed by the state department of agriculture and we have known of their being liberated in serious infestations of the ordinary mealybug in vines and other ornamentals and practically cleaning them up. At least, on this point information may be had by writing H. M. Armitage, State Insectary, Whittier. We may also add that serious infestations of mealybug have at times entirely disappeared, it is thought, because of the

work of some native beneficial insect.

### Cost of Aqueduct

What was the total cost of the Los Angeles aqueduct?—Subscriber, Lodi.

Approximately $24,000,000. This as to the aqueduct, tunnels, steel siphons and reservoirs. In addition there was about a million and a half spent for right of way, minor water rights, etc. The bonds sold to raise funds to cover cost of aqueduct have now been partly redeemed. Of the original debt only about $12,000,000 remains. The payment has been made from the revenues. We recently heard its engineer, William Mulholland, say that the $24,000,0000 property has been conservatively appraised at $52,000,000, but that in his estimation is all too conservative as he considers its real value to the people of Los Angeles $70,000,000. The above does not take into account the distributing system carrying water to the homes in the city. The cost of this has been approximately the same as the cost of the aqueduct, about $25,000,000. This likewise has been paid from the revenues. Approximately another dozen of millions has been raised by sale of bonds, which has been invested in power plants along the line of the aqueduct. These are proving even more profitable to the city than the water supply.

### Trees in Chicken Runs

What trees would be advisable to plant in chicken runs to grow rapidly for shade?—Subscriber, Baldwin Park.

If fruit trees are wanted why not plant walnuts or figs? They are deciduous and give dense shade in summer and sunshine in winter.

### Jerusalem Thorn

Can you tell me the name of shrub of which I enclose leaves and flowers? The trunk is six inches thick and tree is about six feet high. Can I move it successfully.—Subscriber, San Marcos.

Your shrub is Parkinsonia aculeata, native to the American tropics, but called Jerusalem Thorn. We would advise against any attempt to move it except a large ball or block of earth could be moved with it, preferably in a box at least 30 inches in each dimension.

### Squash Bugs

We have a very large bug that gets on the squash vine. They go right at the stem and seem to suck out all the life of the vine. They are about one inch long and one-third inch wide and are a dark grey color. We have used everything we know of to get rid of them, but nothing has helped and now that the squash is all dead they are after the melons.—Subscriber, Chino.

Presumably this is squash bug. There is no satisfactory spray. Instructions as given in the special pest fighting issue of the Cultivator of September 24, 1921, are: "Hand pick early in the season; also pick off eggs and destroy. Eggs are deposited in clusters on the leaves when the vines are very young. Trap bugs by laying boards loosely on the ground under which they crawl for protection. As soon as crop is harvested, gather and burn vines. Do not allow weeds to grow on the ground during winter months.

### Wireworms—Squash Bugs

What will kill wireworms, squash beetles and eelworms?—Subscriber, Bishop.

Wireworms and eelworms, or nematodes, are desperately perplexing pests. There is no satisfactory eradication method. The depredations by wireworms may in part be controlled by burying near the plant to be protected cut pieces of potato. The wireworms gather and proceed to devour the potato which may be carefully lifted and the wireworms destroyed by dropping into oil or making other disposal of them. For eelworms there is but little hope outside of soil sterilization. That may be accomplished by steam heat, formaldehyde, or, as has been suggested more recently, possibly by the application of large amounts of nitrate of soda. Crop rotation is also helpful. As to squash beetles they smell worse and make the farmer madder than most any of the other pests. Still worse, is the method of control, for it means hand picking. See answer to similar question in this department.

### Potato Troubles

What will prevent black rot, brown scab, tuber moth and blight of potatoes?—Subscriber, Bishop.

For the blight and scab the best preventive is to plant seed which has been dipped in formaldehyde, one pint 40 per cent formalhyde to 30 gallons water and plant in disease free soil. However, where blight is once established it is hard to eradicate. To prevent tuber moth infestation leave the potatoes exposed as little as possible after digging. Be sure they are kept well hilled up while growing.

### Gumming of Deciduous Trees

I am enclosing sample of gummy substance which we find on a number of our three year old Kelsey plum trees. This appears on the lower part of the tree. Will you kindly publish cause and remedy?—Subscriber, Fresno.

This is a question which has been discussed in former issues of the Cultivator and recently on pages 261 of issue of September 9; 274, same issue; 311, issue of September 23. This hard crystallized gum will form on peach and other deciduous trees because of injury, diseased condition of sap or physical defect.

## FARM BUREAU DAY AT LOS ANGELES COUNTY FAIR

Friday, October 20, will be Farm Bureau Day at the Los Angeles County Fair at Pomona. A special feature of the day's program will be the awarding of the cups which are given as annual prizes in the Los Angeles County farm bureau dairy cow competition, and the cups and medals won by poultrymen at the Southern California farm bureau egg laying contest which has just closed. This program will take place in front of the grandstand at 1:30 in the afternoon just before the races start. This will be an exceedingly attractive feature of the day's program as there will be more than 30 cups to be awarded as well as some medals.

## THORNLESS BLACKBERRIES

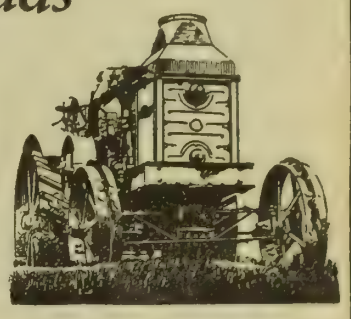
Complaints reach the Cultivator of thornless blackberries proving unprofitable through non-fruiting though plants grow rank. We fear this condition is common only to the Burbank Thornless. We have not heard similar complaints where plants are known to be Cory Thornless. One correspondent suggests that thornless blackberries are merely a fad, but many growers find them more profitable than others as they bear as heavily, sell as well to retailer and canner and are picked faster and the plants picked cleaner than the thorny varieties. Burbank Thornless will fruit well if heavily pruned.

## FARM TRESPASSERS SCORED

Town people sometimes drive through country districts and raid the farmer of his fruit and other products. Everything that grows on a farmer's farm belongs to that farmer. To take even wild fruit without his permission is as much a misdemeanor as to take his corn, potatoes or chickens.

The TRACTOR that successfully burns cheap fuel Oils

—Under All Conditions
—At All Loads



THINK of a tractor designed *especially* to burn kerosene and other cheap fuels. A tractor that burns kerosene successfully under ALL conditions and at ALL loads — not just under favorable conditions. That is the OilPull! Many owners are burning stove tops and distillate with excellent results. There is no missing or "loading up" at light loads or when idling.

OILPULL

"The Cheapest Farm Power"

The OilPull burns these cheap fuel oils successfully, because of Triple Heat Control, a perfected system of oil burning that positively controls motor temperatures. Motor is never too hot, even when doing hardest work in hottest weather—never too cold, even when idling or working at lightest loads. The result is maximum power from the cheapest fuels. The OilPull is guaranteed in writing to burn kerosene successfully—under *all* conditions—and at *all* loads—up to the rated brake horsepower of the tractor. It saves at least 39% of the fuel costs when using kerosene — it saves even more when stove tops or distillate is used.

**Write for Free Booklet**

Learn how the OilPull not only has to its credit—(1) All Principal National Fuel Records for the past 10 years but also (2) Shows upkeep cost of only 50% of the Government's national average, besides (3) OilPulls average 10 years and more of service. Our special booklet on Triple Heat Control gives all the facts. Write for your free copy. Also ask the Advance-Rumely dealer for demonstration.

ADVANCE-RUMELY
THRESHER CO., INC., 17-19 Main St., San Francisco, Cal.

The Advance-Rumely Line includes kerosene tractors, steam engines, grain and rice threshers, alfalfa and clover hullers, husker-shredders and farm trucks.

### A NATION'S HOPE

Who are the men of the morrow?
Seek ye the boys of today!
Follow the plow and the harrow;
Look where they rake the hay.
Walk with the cows from the pasture,
Seek 'mid the tasseled corn;
Try where you hear the thresher
Humming in the early morn.
Who are the men of the morrow?
Look at your sturdy arm!
A nation's hope for the future
Lives in the boy on the farm.

### POPPY O' THE WHEAT

By Frances Greenman in Youth's Companion

PETERSON'S Poppy was racing to towy. Down the level reaches of a Kansas highway, thick with dust, sped the stanch little automobile. Poppy, hatless and happy, with her slender brown hands sure and steady on the wheel and her gray eyes on the road, was humming softly:

"Back of the flour the mill,
Back of the mill the wheat.

"And me," she added, laughing, "and Uncle Swan and Aunt Lena and the boys; we are back of one particular wheat deal. How lovely it is, the wheat! But, oh, the hard work behind a loaf of bread! Dear knows how farmer folk spared time to go to town and back for supplies before autos happened."

The car speed merrily along; spirals of dust followed in its wake and drifted in a fine powder upon the Jimson weeds and the young sunflower shoots that bordered the road.

In pioneer days "bullwhackers" had crawled along over the same route toward trading points in old Mexico, little dreaming that in future years a golden store to help fill the world's bread basket would come from that sun-browned country.

Poppy's eyes swept to the right and to the left—wheat, wheat, wheat, covering every field right up to the dust of the roadway! A golden sea, rippled by prairie winds! "I love it," she murmured, "but I wish harvest were ended."

She slowed the car as she approached a big white house surrounded with wheat. She blew the horn and leaned out from under the hood. "Hello-oo, Mizzoo."

"Coming." A plump girl in khaki hurried down the walk. "It's mighty nice of you-all, Poppy," said Missouri as she climbed into the automobile. "Pa allowed he was too plumb busy rounding up hands to take time to trade. Ma needs all this." She waved a sheet of paper on which a long array of "wants" was listed. "Ain't harvesting the limit? Ma says she wished we had never left old Missouri; give her the little farm back there in the Ozark hills; but pa is wheat-bound—hurrahs for Kansas the year round. He's in town every day, haunting the railroads, endeavoring to entice likely and unlikely gentlemen off the trains into the wheat. I'll wager I may have to drive yet. We couldn't get track of a hired girl; we scoured the country pretty nearly to the Colorado line, and what did we get? An Indian!"

"Territory?"

"No; Haskell. She allows she'll take a place during vacation. Her name is Arabella Two Feathers. Don't suppose she wears a blanket, do you?"

"If she does now, she will not later on," replied Poppy, laughing; "not when the thermometer take a high fly. It's never very cool at harvest time. I'm glad you found Arabella. Long may the feathers wave! I wish we had an Indian to help us, feathered or unfeathered."

Missouri's white, even teeth flashed; no one could call her plain when she smiled. But Poppy was radiant and had dancing eyes and crinkly hair and a complexion that remained fair in spite of prairie winds.

Peterson's Poppy and Missouri Smith had graduated from district school with "nice exercises," and Poppy had headed the class with remarkably high grades. Then the two girls had fared along to county high school and had finished together, thanks to Poppy, for Missouri, according to her own honest story, had been obliged to work like a clock to pass. "If Poppy hadn't been right there to wind me up," Missouri had said, "I should have run down in my freshman year. But Poppy had a walk-over; she shone even in geometry, I never see a square or a triangle but I get cold feet."

But only Poppy and Missouri knew how persistently, patiently and painfully Missouri had worked to pass. The girls' paths would soon diverge, for Mr. Smith was long on wheat and education, whereas Mr. Peterson was long on wheat alone. Only reluctlantly had he consented to Poppy's going to high school, and when agricultural college and a career as home demonstrator were broached he fell silent. You cannot argue with a wordless opponent.

"Too bad," said Aunt Lena and Gene and Swan Junior and Johnny. "We'd like to see you graduate some more, Poppy, but—"

The boys had once been content with the education that they had got at the district school, but now they wished they had gone to the county high school and "on and up." "Pa thinks," said Gene, "that we know enough to raise wheat. Anyhow it's too late for us to broaden out with an education, but we want you to get one, Poppy. Dad's piling up the dollars fast. This year's yield will average forty bushels to the acre, and every grain is No. 2 or better. He could stake you four years at Aggie well as not."

Poppy said little about college, but her disappointment was keen. Now as she drove the car between fields of gold her brain was busy with thoughts of it.

"Nickel for your thoughts," said Missouri; "I've been thinking hard lately, Poppy. I don't want to go to college without you, but pa's so set on education! You may rest easy, though, on this: I don't take any prizes in math. I'm going to select some studies I can do without laying down my life to get a grade. Can't your Aunt Lena talk your Uncle Swan over?"

Poppy shook her head and put her foot on the accelerator; both girls became silent as the car sped along a fine bit of road.

Aunt Lena was American born, but Swanson Peterson had lived in Sweden for the first twenty years of his life; at the age of twenty he had made the great adventure to America and had brought along a small bundle of clothing, a dogged persistence and inherited ideas of thrift and economy. He took up land, built a "soddy," married Anderson's yellow-haired Lena and held on in the prairie country through drouth, grasshoppers and hot winds until wheat "made" western Kansas. Then Mr. Peterson became a king.

"I wonder what sort of a bunch we'll get this year," said Missouri, thinking again of the harvest. "Remember the poet pa captured last year off the Rock Island? He fell down the first day. He raved over the beautiful yellow sea when his eye lit on the wheat, but when he waded in the poetry didn't work. And eat! Locusts and grasshoppers aren't in it compared with harvesters. Ma plans to make bread all day tomorrow. I'm glad we have an oil stove—" Missouri stopped suddenly as she remembered the hot range in the Peterson kitchen.

"We too," said Poppy, turning the car at Kerry Crossing on the last stretch to town. "The boys get wages this harvest, so they have bought Aunt Lena the best oil range Vantyne had in the store. They brought it out last night. Johnny was so proud; Gene says he sat up nearly all night courting the stove."

"Won't you be happy!" said Missouri rather absently, thinking how loyal Poppy was to Swanson Peterson—never complaining or criticizing. "She must come of mighty fine folks," Missouri mentally concluded.

People in the wheat country loved Peterson's Poppy. No one knew her real name. In a country churchyard down the road a "piece" from the ranch Poppy's folks were sleeping the long sleep. Years ago in early springtime a mover had camped one evening in a bend of the Troublesome; the creek was on a "rampage" and was muddy and deep and swift from spring rains. The mover, so Swanson Peterson declared, must have been all kinds of a tenderfoot to try to ford it. Peterson, who was looking for a stray cow, had witnessed the tragedy and at the risk of his own life had urged his mount into the rushing waters. He saved a mite of a two year old girl and the Petersons gladly gave her a refuge. She was about the age of their own daughter, Hilda, who had died the preceding winter. So had happened Peterson's Poppy.

At the edge of town the two girls met a battered old automobile full of "gleanings." Mr. Peterson had evidently been to the railway station. "College boys and full of pep," cried Missouri, "but wait awhile-o; they'll eat you out o' house hand home three times a day. Don't you wish your feet were rubber tired during the harvest rush Poppy?"

"Surelee, if they wouldn't puncture," Poppy replied and laughed.

"Here we are at Hafner's. Now for a load of groceries. Maybe we shall have to leave our feet and come back for them, for I do not see how we are to stow away everything in this car. So long. Let's try each to capture a swift clerk."

That evening Poppy snatched time to watch a picture in the western sky; her eyes were wide with wonder as flaming bars touched the wheat to a gleaming radiance as far as the eye could reach. As the sun slipped lower a little breeze ruffled the golden sea. "It is beautiful, the wheat," murmur-

## The Cultivator Patterns

**4093, Child's Coat**—Cut in 4 sizes: 6 months, 1 year, 2 and 3 years. A 2 year size requires for the skirt. Price 10c.

**4094, Child's Play Garment**—Cut in 4 sizes, 2, 4, 6 and 8 years. A 4 year size requires 2 yards of 32 inch material. Price 10c.

**4079, Misses' Dress**—Cut in 3 sizes: 16, 18 and 20 years. An 18 year size requires 5 yards of 32 inch material. The width of the dress at the foot with plaits extended is 2¾ yards. Price 10 cents.

**4096, Ladies' Dress**—Cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38 inch size requires 7⅝ yards of 32 inch material. The width of the skirt at the foot, without overlapping portion, is 2⅝ yards. Price 10 cents.

**3781, Girl's Jumper Dress**—Cut in 4 sizes: 8, 10, 12 and 14 years. A 12 year size will require 4½ yards of 40 inch material. Price 10c.

**4084, Girls' Dress**—Cut in 4 sizes: 8, 10, 12 and 14 years. A 10 year size requires 2½ yards of 32 inch material for the blouse and 2⅝ yards 1⅝ yard of 40 inch material. Price 10c.

**3869, Ladies' Apron**—Cut in 4 sizes: Small, 34-36; Medium, 38-40; Large, 42-44; Extra Large, 46-48 inches bust measure. A medium size requires 3⅞ yards of 36 inch material. Price 10 cents.

**3718, Ladies' House or Day Dress**—Cut in 7 Sizes: 36, 38, 40, 42, 44, 46 and 48 inches bust measure. A 38 inch size requires 6 yards of 36 inch material. If made as illustrated it will require 4⅜ yards of plaid and 1⅝ yards of plain material 36 inches wide. The width of the skirt at the foot is about 2¼ yards. Price 10 cents.

**PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH**

**HOW TO ORDER PATTERNS**

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cent) stamps for each number. In order to furnish our readers with the very best NEW YORK styles, all patterns ordered are filled in NEW YORK. Do not expect patterns under **Two Weeks** from date of order.

**CATALOGUE NOTICE**

Send 12c in silver or stamps for our Up To Date Fall and Winter 1922 Catalogue. This is even better than the Spring and Summer number. It will have 8 colored plates,, the same as the last catalogue, but a great many of the other pages will be arranged in plate form, so that the Fall and Winter Catalogue will be more like a fashion book than a pattern catalogue.. It will also include points for the needle and hints for the home dressmaker.

**PATTERN DEPARTMENT**
**California Cultivator** **Los Angeles**

ed Poppy, "but I wonder if the folks outside the belt know how much hard work there is behind a slice of bread."

"Poppy!"

"Coming, Aunt Lena," and Poppy went to set the table for a horde of hungry men.

Harvest was in full blast in the Peterson fields. The buzz of reapers, the steady zipping song of the thresher, the pop-pop-pop-pop of tractors and the hullabaloo of unmuffled trucks broke the quiet of the wheatlands.

Harvest was also under way in the Peterson kitchen. "Seems as if," lamented Aunt Lena, "these here men can beat that prestidigitator gentleman we saw over to the county seat all hollow. I lay out an array of pies, enough for a bakery with a steady trade, and when I turn around, so to say, there ain't no pies. And bread and ginger cakes disappear as if a cyclone had swept over. It's awful! Poppy, you'll have to crank up the car and run into town, for every last can o' corn is gone. And meat and butter. Get a pencil, honey; put down a list. You'll need a big piece of paper, too."

So Poppy "ran" to town, cooked washed dishes, baked and waited on table; she worked steadily from sunrise to past dark.

"She's pure gold, our Poppy," said Johnny. "Some girls would fall down on the job. Pa ought to make ma and Poppy a mighty fine present when the rush is over. If I had a hundred dollars or so ahead, I'd stake her to that there Aggie college."

"Dad thinks schools gives 'em notions," said Swan Junior, "but as I understand it Poppy don't crave city life; she wants to come back here to this community and—"

"Oh, well," Gene interrupted him, "our blowing about it won't help any. Wheat's waiting yonder. We'd better get to work."

Harvest time table, talk often rose above wheat. The college boys told wonderfully alluring tales of life at K. U. and at "Aggie;" they fired even Johnny's imagination. Poppy, tripping from stove to table with cups and steaming platters, lost not a word; she was hungrier for education than a harvest hand is for a square meal.

But as usual whenever school was a topic of conversation Swanson Peterson became silent; he was interested only in wheat. When a rise in price seemed probable he beamed and planned to buy another tractor and to build the biggest granary in the county; he was casting covetous glances on the Moran section. He wished to be a great king. Schools! What were schools? Here was his Poppy not satisfied with two diplomas!

Sometimes in the cool of the evenings the college boys sang the popular lilting melodies of the day, and their voices would carry far. Jan Nielson, bossing a "twilight squad," would pause to listen. "Them chaps by Peterson's. I got no canaries this year. They sound goot."

At the end of harvest when the college boys were going away, one of them—Brice Allard, who hurrahed for "Aggie" and had encouraged Poppy's ambitions for more education at every opportunity—looked thoughtfully over the stubble. "Miss Poppy," he asked, "don't the ranchers ever glean?"

"Not in years like this; the yield is too great. It satisfies."

"I have half a mind not to follow the harvest north, but to stay here and emulate Ruth. The picking looks good to me, for lots of wheat was spilled; and such swaths left at the endges! Ever thought about college by way of Ruth route?"

Early the next morning Poppy took a long walk over and round some of the fields. When she returned she was thoughtful, but then Poppy talked less than most girls talk. She did not mention gleaning.

Uncle Swan, jubilant over the big harvest, had offered to take Aunt Lena to Dakota to visit her sister; incidentally he wanted to compare notes with his brother-in-law. Aunt Lena was so happy that she almost wept. She said, "All right," and then bought a duster and a tight little boat of a hat.

Just before they set forth Swanson turned to Poppy. "You ban goot girl, Poppy; you work fine. I make you present, eh, what?"

"The gleanings," said Poppy unexpectedly.

R-A

**Underwear**

## Farm Children

need warm, durable underwear. And they want it soft, roomy and comfortable.

Now you can have *just that* by asking for R. A. make at the better stores.

It's worth while insisting on R. A. Then you will get the finest cotton, long wear seams, extra full seat and button holes which keep the garment buttoned.

R. A. has no equal and will wear a year or more longer than ordinary underwear, if carefully laundered.

Women's and children's unions and separate garments and children's waist suits. Extra out sizes for stout women.

"And yet the price of R. A. is Moderate."

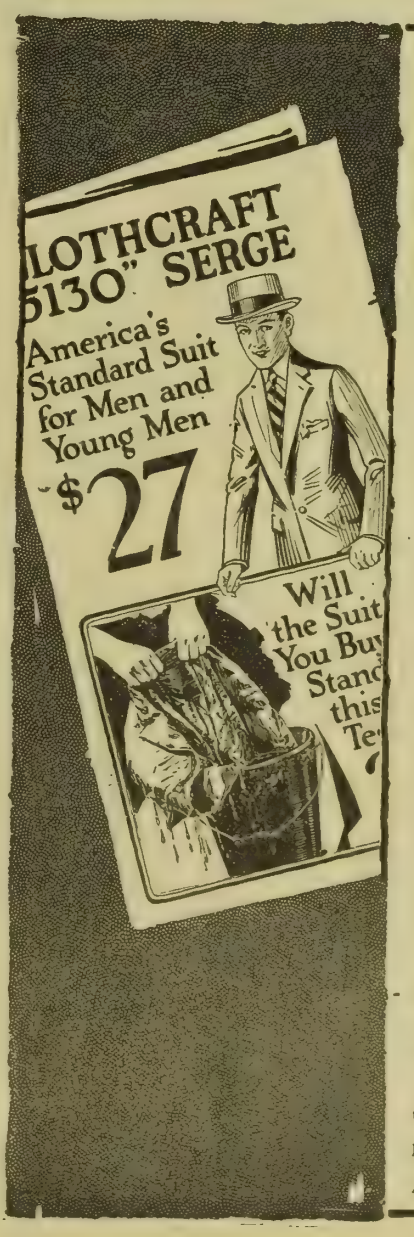
**HAGERSTOWN, MD.**



*Will the Suit You Buy Stand This Test?*

COULD you soak *your* suit in water—a whole suit, made up of so many little, yet important parts (fabric, findings, haircloth, canvas, thread, etc., all put together carefully)—and then after it has been soaked, dried and pressed, be sure that it would be as good as new?

You CAN, if it is a Clothcraft Suit!

Read the dramatic story of the test in this little folder. But don't be content with reading. Examine the actual serge samples enclosed in the folder. Test them critically.

We'd like to send you one of these Swatch Folders *without charge*. Just fill in the blank below, or simply use a postcard.

THE JOSEPH & FEISS CO.
Cleveland, Ohio.

The Joseph & Feiss Co.
2166 West 53rd Street
Cleveland, Ohio

Please send me, without obligation, folder containing actual swatches of Clothcraft Serge.

Name .....

Address .....

Mr. Peterson stared at the slender girl. "What! What you say?"

"I ask for the fields, Uncle Swan."

Then he laughed. "That's a goot joke once. You make your fun, Poppy?"

"No, Uncle Swan; that is the present I ask."

The wrinkles about the wheat king's mouth deepened as he put a finger beneath Poppy's round chin. "Child, you got the dare to try?"

"Sure," Poppy's eyes did not falter.

"Then," he said slowly, "for effery bushel of gleanings I find when I get back I treble 'em. Goot-by."

In the farmhouse at supper time talk ran all to gleaning and to prospects of college for Poppy. "It may pay well this year," said Gene. "We boys will knock off now and then and help; but you'll find it a back-breaking job." So Poppy got into a suit of overalls and set to work.

Although the Book of Ruth makes pleasant reading, gleaning is not pleasant in Kansas fields; sunshine of the ardent, persistent, Kansas kind kept Poppy company.

"Gee," said faithful Johnny, wiping his face with a red bandanna, "ain't it fierce? I don't believe we can glean you into Aggie this year, Poppy.

"No-o, but it is a beginning."

"Mebbe," said Johnny hopefully, "you'll strike a run o' luck before September and get there anyhow."

"I agree with the man who declares that luck plays about two per cent in most achievements," said Poppy; "it takes ninety-eight per cent of pluck to win out. Now for the strip yonder. Looks as if some Boaz had given orders here."

At the end of many a work-filled day Poppy tumbled into bed too tired even to glance at the beauty of white moonlight on the vast reaches of prairie or, once she fell asleep, to awaken to the music of mocking birds that sang the night through.

Presently word went round that Peterson's Poppy was in wheat "for all it was worth." Missouri came over and brought Arabella Two Feathers with her. Arabella wore no blanket and talked very good English; she too worked like a clock.

"You-all needn't to try to boss us out of this field, Poppy," declared Missouri. "We have come to help. Maybe you-all don't think I remember how you-all stood by me during high school days. You-all needn't to say one word. Ma sent a piece of ice and a dozen lemons to cheer us along."

"But, Mizzoo, I didn't expect help," cried Poppy, "except what the boys could find time for. I shan't become rich in any case, but, if I can get a start toward college, I'm willing to work—"

"Pooh!" said Missouri. "You might be generous and let willing folks like me have a hand in the pie. Let's glean."

Then Jan Neilson's young folks and then Tom Johnson's Bob "cut in" and the first thing Poppy knew there was a gleaning bee in the Peterson stubble. The result measured above Gene's shrewd calculations.

"Pretty good," said Swan Junior. "What'll dad say?"

"He'll do!" replied Gene. "Dad never goes back on his word. He'll fork over three bushels for every one gleaned."

Then Missouri's father offered his fields. "No, it's not charity," he said. "No one cares to glean this year except you, Poppy. When a man's cleared up forty thousand bushels or so he's not what you'd say interested in gleaning. You're helping me out; so go to it right away, for I'm most ready to list for the fall sowing."

Poppy "went to it" with hired help; she would accept no more bees.

"I'm looking forward to seeing dad's face when he sees Poppy's harvest," said Johnny.

"It'll stake her half a year, maybe more."

"A semester," Johnny corrected him.

"It is a beginning," said Swan Junior.

When Swanson Peterson saw the gleanings his face was a picture, not of selfish regret, but of pride. "My Poppy stick to it so long! I said to mamma up in Dakota, 'I'll bet Poppy peters out the first day yet.' " Then he chuckled and did some figuring on an old envelope.

When he told Poppy how much he owed her she protested. "I thought you meant to triple the gleanings from just your fields, Uncle Swan. The boys helped too; so consider that I didn't glean alone all the time."

"I said gleanings. I keep to my vort, but I ban poor man after I put in a farm lighting system for mamma."

Aunt Lena sat down suddenly on a chair; her blue eyes were wide with amazement.

"I get some eye opener up in Dakota," Peterson went on. "I guess wheat women need some wages yet. I like your pluck, Poppy. You win me over. I guess you ban smart 'nough to go to college and get no notions. Me and gleanings, we see you through. You ban nice wheat lady, my Poppy."

## HOUSEHOLD QUERIES

### Paprika in Tomatoes

Recipe for tomato catsup in the Cultivator of July 22 gave 4 tablespoons of papriika to one gallon tomato pulp. That is too much. I cooked fresh tomatoes three times more than the amount given and, believe me, it is more than peppery enough yet. I understand paprika is the red pepper. That is what I used, exactly the measure, four tablespoons to a gallon of tomatoes.—Subscriber Merced.

Paprika is made from sweet peppers and is not hot at all; it merely adds a spicy pungency and red coloring matter. The Merced subscriber evidently used cayenne or other hot pepper. Note this recipe called for one tablespoon pepper (ordinary ground table white or black) and 2 cut red peppers in addition to the 4 tablespoons of ground paprika.

### Cooking With Electricity—Recipes Requested

Your paper has been of great help to me, and I was especially interested in the article a few weeks ago on the use of electricity in cooking. I would like to hear from any of the subscribers who have tried this. How they cook in the ovens whole meals and how to economize in the use of these stoves. It sounds good for the farm. Would like other women's experience. Would like some practical recipes for sour cream and for using green tomatoes.—Subscriber Santa Cruz.

The Cultivator will be glad to give space in these columns to experiences in use of electricity in cooking. That is something every housekeeper is vitally interested in. With prospects for great development and distribution of electric power at cheap rates, California women know it is not only of vital but of immediate interest.

Recipes for green tomato pickle, Page 179, Cultivator of August 19; green tomato pie and preserves, Page 239, Cultivator of September 2; green tomato mincemeat, Cultivator of September 9. We are assuming that our subscriber has these recent numbers; if not and she will notify us we will mail. Here are some good sour cream recipes:

Note use of sour cream in corn chowder in this department.

Sour Cream Biscuit—For each quart flour use one level teaspoon soda, level teaspoon salt. Sift thoroughly or soda may show in yellow streaks. Mix with sufficient sour cream a little stiffer than baking powder biscuit. (Remember that pasteurized cream is not very sour. Ordinarily use it with baking powder, not soda; if it has stood sometime and tastes more acid, add a "pinch" of soda—enough to take away the sour taste—and the usual quantity of baking powder. A good cook tastes frequently and critically.)

Tomato Soup and Cream Sauce—Sour cream makes soups and creamed dishes utterly delicious. To use in to-

GHIRARDELLI'S

# Chocolate Sauce

Home made

—you use it this way:

As a chocolate sauce for ice cream and iced drinks; as a hot or cold sauce for custard and gelatine puddings—yes, and for blanc mange and cottage pudding. [You can make a delicious impromptu pudding out of several slices of stale cake covered with this chocolate sauce.] In fact, you can use it for anything where a pudding sauce is acceptable.

—you make it this way:

Mix 1 cup sugar with 1 cup Ghirardelli's Ground Chocolate. Add ½ cup boiling water, ⅛ teaspoon salt, and cook 10 minutes or until thick. When cold, add 1 teaspoon vanilla. Store in tightly covered jar. This will make about 1 pint of chocolate sauce and will keep several weeks. Say "*Gear-ar-delly*" to your grocer and send for our recipe booklet.

Since 1852 D. GHIRARDELLI CO. San Francisco

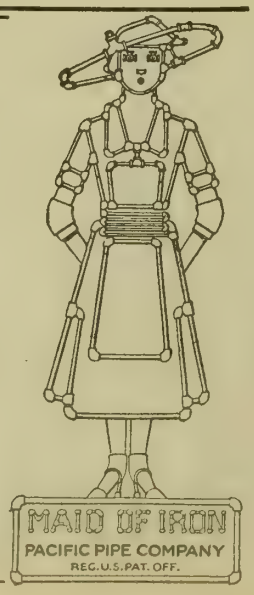
## The Practical Pipe for Your Irrigation Problems

Experience has proven the superiority of iron pipe for irrigation purposes. And, when you specify Pacific Iron Pipe you can be confident of getting the best used iron pipe on the market. Every length is thoroughly tested and guaranteed.

Send us your pipe requirements. You will find our prices right and shipments prompt. Remember that we carry a full line of new and used pipe, screw casings, valves and fittings.



PACIFIC PIPE CO.

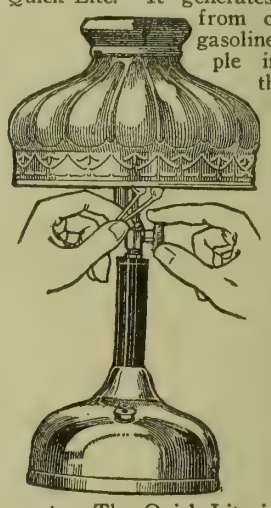
237 Howard Street San Francisco

# Wonderful Home Light

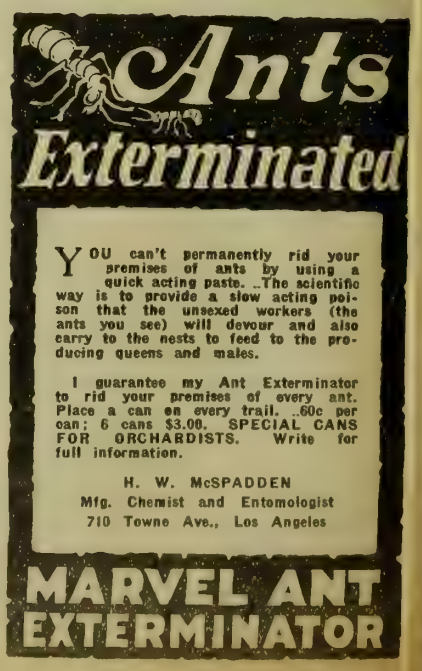
**New Gasoline Lamp Gives 300 Candle Power Brilliance at Low Cost**

A gasoline lamp that gives more light than 20 old style oil lamps at about one-tenth the cost is the leading product of the Coleman Lamp Co., Los Angeles, Cal.

This remarkable lamp is known as the Quick-Lite. It generates its own gas from common motor gasoline and is so simple in construction that even a child can operate it. The Coleman "Quick-Lite" is safe, dependable and economical. Unlike other gasoline lamps, the Quick-Lite lights with ordinary matches. Nearly a million are in use in American homes. Thousands more are used to light stores, halls, churches, etc. The Quick-Lite is gaining wide favor in cities, too. Many claim it is superior to electricity because the light is soft and restful to the eyes.



The above picture shows one of several models. More than 30,000 dealers sell "Quick-Lites." Anyone interested in better light may see this lamp lighted at a nearby hardware or general store. Full information together with an interesting booklet may be had free by addressing the Coleman Lamp Co., CA 73, Los Angeles, Cal.



Ants
Exterminated
YOU can't permanently rid your premises of ants by using a quick acting paste. The scientific way is to provide a slow acting poison that the unsexed workers (the ants you see) will devour and also carry to the nests to feed to the producing queens and males.
I guarantee my Ant Exterminator to rid your premises of every ant. Place a can on every trail. .60c per can; 6 cans $3.00. SPECIAL CANS FOR ORCHARDISTS. Write for full information.
H. W. McSPADDEN
Mfg. Chemist and Entomologist
710 Towne Ave., Los Angeles
MARVEL ANT EXTERMINATOR

mato soup add very little soda, sufficient to neutralize sour taste. When it stops foaming, add to tomato soup when ready to serve, cooking only enough to heat through. It may be used in cream sauce and for seasoning vegetables without addition of soda, though some cooks always add it.

Sour Cream Frosting—One cup thick sour cream, 1½ cups granlated sugar, pinch soda. Boil about 8 minutes, remove from fire, add one cup finely chopped nut meats, stirring till cool.

Salad Dressing—Thin any prepared salad dressing with sour cream, adding little salt to taste.

Sour Cream Cucumber Dressing—Pare and grate one medium sized cucumber and sprinkle with 1 teaspoon salt. Let stand 1 hour, then drain. Place 1 cup sour cream in bowl. Beat till stiff, add prepared cucumber and 1 teaspoon each mustard and pepper, 2 tablespoons each finely chopped onion and parsley, juice ½ lemon.

Generally, sour cream may be substituted in any recipe calling for sour milk. In this case omit all or part of shortening according to richness of cream.

### Corn Chowder

Please tell me how to make corn chowder. I had a fine recipe but misplaced it when moving. It was in the fall of 1919 that I found it in your Cultivator. I have been a subscriber of your Cultivator for many years and enjoy reading it so much.—Subscriber, San Bernardino.

This recipe was given in the Cultivator of August 30, 1919. We hope it is the one wished: Cut fat fresh or salt pork in dice (about one cup), brown in kettle. Slice on top thin layer onions and thick layer diced potatoes. Brown in fat, then add fresh corn cut from cob, pepper and salt to taste and tablespoon sugar. Cover with hot water, put top on kettle and cook slowly half an hour. Add 1 cup hot cream, sweet or sour, or milk and serve.

## HINTS FROM HOUSEKEEPERS

### Canning Egg Plant

In your issue of September 16 I notice "Subscriber, Ceres" is asking directions for putting up egg plant and submit the following: Pare egg plant, cut into thin slices and boil it 15 or 20 minutes, drain off water, pack egg plant in jars, fill to overflowing with cold water, place rubber and jar top in place, not tight. Process the egg plant in home made or commercial steam cooker 4 hours. One hour when using from 5 to 10 pounds of steam pressure, with the steam pressure canning devices; 40 minutes if using aluminum steam pressure cooking outfit. After processing required time remove jars, tighten covers, invert to test the joints and cool. I wish to thank the Household Department for many helpful hints and hope my canned egg plant recipe may help some other homemaker.—Mrs. N. A. Waters, Anaheim.

I saw an inquiry in recent issue, concerning the canning of egg plant. I can it every summer and find it a splendid addition to my winter menu. I do not use the cold pack method and have very good success canning it in tin cans (new) preferably. I imagine the cold pack might be better but am not used to it. Try this and see if you like it:

Pare and dice one egg plant (medium size) soak in salt water ½ hour. While soaking stew one good sized onion (sliced); add then one large sweet pepper and one or two tomatoes, salting and otherwise seasoning as you add this to the egg plant. Cook until all seems done. A little hot pepper added makes it Spanish. In canning I use the same proportion except that I do not can any onion with it. I add that when I open my cans in the winter.—J. E. M., Orange.

### Quinces—Yellow Tomatoes

Seeing some recipes for preparing quinces I wish to tell mine which I accidentally discovered last fall. It originated from baking quince, leaving core and peeling on and quick baking. They are clearer and form a jelly instead of being dark and strong as they sometimes are. Trim quinces by cutting out any bad spots and slice with the skins and cores on as these help them to jelly. Set on to cook with plenty of water to cover, boil briskly in a covered pan until slightly tender, then add sugar. As I do not measure I cannot give exact rule but I use enough sugar so that when they are done there is a jelly in between the fruit. After adding sugar set in the oven in a covered pan (generally leave the door ajar) and continue to cook until pieces boil up like jelly.

Yellow Tomatoes—Here is a tomato recipe that is nice. To 10 pounds yellow tomatoes add 5 pounds sugar and 1 can grated pineapple. Peel, let stand a while, then dip off surplus juice and cook as other preserves. While I never have tried it I believe by cooking in the oven in a covered pan like the quince preserves, they would be better.—Mrs. Clara Schrack, Valley Springs.

### Bleaching Flour Sacks

In your September 2d number saw article on bleaching flour sacks. Do not know whether or not you have received the following method from some other subscriber, so will send it: To bleach flour sacks wet new sacks with coal oil, especially the lettering, and sprinkle a handful of rain water crystals or hydro-pura on them and roll up for a few hours or over night, then boil and with very little rubbing the sacks will be free of all lettering. —Subscriber, Arroyo Grande.

## DRYING MILK CANS

Because bacteria increase in numbers at such an astounding rate when conditions are favorable it is necessary not only to kill as many of them as possible in order to keep dairy utensils clean and insure a good product; but utensils must be kept dry so that the few organisms that are left after sterilization will not multiply greatly. In addition to the proper temperature it is necessary that moisture be present for these germs to grow, but only a very thin film of water is needed.

It is particularly important that milk cans be thoroughly dried and kept dry until used again. In addition, they must be protected from contamination with dust, other dirt and flies. Experiments carried on by the United States department of agriculture show that in milk cans which were covered before being dried the number of bacteria increased 700 times in 24 hours. An average of seven tests showed that the count increased from 1,111,514 to 775,751,429. Milk put into cans in which the bacteria have been permitted to multiply to such an extent will spoil much sooner than milk put into cans before being covered.

To secure rapid drying the cans must be sterilized with steam or boiling water. If a sterilizer is used the cans may be left in it until time for them to be used again, but there must be some means of ventilation to carry off the moisture. Cans may be set on a rack to dry, but they should be protected from flies and dust, preferably in a well screened milk house.

## FLOUR MILLS MERGER

The newspapers announce the completion of negotiations by which the Sperry Flour Company has come into possession of the Portland Flouring Mills which will now be added to the long string of great mills owned up and down the coast by the Sperry people.

The company will have a combined milling capacity of 27,000 barrels per day and will extend its milling operations throughout the Pacific Coast, securing the advantage of business now controlled by the Portland Flouring Mills Company in the Northwest. The new company will occupy a dominant position in the flouring and milling business of the Pacific Coast.

The Sperry Flour Company was incorporated in 1892 and represents an amalgamation of businesses, some of which were established as early as 1852. The company's plants and properties are located in Stockton, Vallejo, Fresno, Los Angeles, in this state, and at Spokane, Creston and Tacoma, Washington, and Ogden, Utah.

**Why sign notes at the dining table?**

IF your mealtime cup of coffee leads you into midnight wakefulness and mid-afternoon drowsiness (as so often happens) why not stop giving the promise to pay?

It is so easy to keep out of debt by turning to Postum.

Postum is a satisfying, mealtime drink, rich in flavor and aroma—and with no regretful settlements, afterward.

Why not try Postum instead of coffee today, and pave the way to better health and happiness?

*Sold by All Grocers*

Postum comes in two forms: Instant Postum (in tins) prepared instantly in the cup by the addition of boiling water. Postum Cereal (in packages, for those who prefer to make the drink while the meal is being prepared) made by boiling fully 20 minutes.

# Ray Holstein Sale Above the Average

When Carl Ray of Lankershim decided to sell his milking cows everyone predicted that he would have a good sale for practically every cow had a good seven day record and many had large semi-official records or were making them.

These cows were the foundation females that Mr. Ray had chosen for his own use before his picture theaters began to take so much of his time and they were high priced animals out of a bunch of big sales. Many of the rank and file of the Holstein breeders were absent for one reason or another and good animals failed to bring their worth as the buyers did not recognize their greatness. It was a wonderful chance for new men and a number took advantage of the opportunity. Superintendent W. R. Harriman of the Los Angeles County Farm was on the job and none of the good ones escaped without being carried to the highest point that he could afford. He was able to outbid everyone on five very good ones.

On account of missing his train from Modesto, Fred Hartsook was unable to attend but E. J. Sturgis who represents him bought the top animal of the sale. She was Victoria Brunaro Johanna, a fine big 321 pound cow who is making a wonderful start towards a big yearly record. In 92 days she has made 304 pounds butter from 9144 pounds milk. This means she has made over 100 pounds butter from 3000 pounds milk each month. The day before the sale she produced 120 pounds milk and was a bargain at the $1600 which Sturgis had to pay for her. She sold open and will be bred to the great Hartsook herd sire, Sir Aaggie De Kol Mead and should prove a valuable addition to Hartsook's herd of exceptional cows.

Walter Simons of Burbank and Major R. M. Ashbrook who is founding a small herd at Riverside were frequent buyers who showed keen discrimination for the good ones. D. L. Wright of Pasadena bought the second high cow, Rosamaines Bonita Ormsby, a 32 pound three year old, for $1000. She also sold open and will be bred to his fine young bull who is a son of King Segis Pontiac Count. Mr. Wright is also a discriminating buyer and his herd of females will be a good one.

Rhoades and Rhoades, represented by Cols. Ben and Harold and John Davis were the efficient auctioneers and C. L. Hughes of the California Breeders Sales and Pedigree Company mnaged the sale.

A total of $14,900 for the 36 head or an average of $413—which is by the way the exact average of the Maxwell sale a few weeks ago—was very satisfactory.

That there is no greater asset in Southern California than a good herd of registered Holsteins was proven again by this sale as well as by the numerous ones which have preceded it. They are always in demand and sure to bring good prices.

Purchased by Fred Hartsook, Lankershim; Victoria Brunaro Johanna, $1600.

D. L. Wright, Pasadena; Rosamaines Bonita Ormsby, $1000.

Walter Simons, Burbank; Miss Maggrath Hengerveld, $750. Burbank Maggrath Korndyke, $350. Beauty Mercedes Mandane, $400. Jessie Pontiac, $350. Fenton Katrina Hengerveld, $350. # Stock Disease Control

Efforts of the department of agriculture to wipe out disease among livestock in California have resulted in decreases of 50 per cent and in some cases eradication of animal ailments, according to an announcement by Dr. J. G. Jackley, assistant chief of the division of animal industry.

Complete control of the Nevada cattle scab situation, which a month ago endangered the herds of the Sacramento and San Joaquin valleys, has been accomplished through the issuance of a proclamation by the governor placing an embargo, May 1, on all infected Nevada cattle. All cattle intended for transportation through California must be dipped before leaving Nevada, and railroads have been instructed to accept no shipments unless dipping certificates are given. There are no signs of the disease in the big cattle districts of this state.

The department has effected a 50 per cent decrease in sheep scab throughout the state during the past five years, and the elimination of this serious disease is being brought about rapidly. Though the disease presents a serious problem in a warm climate such as that of California, it exists at the present time, only in a small portion of the San Joaquin Valley, the Upper Sacramento Valley and a few points in the coast counties. It is safe to say that sheep scab will be eradicated in California within another five years if the department of animal industry continues to make the progress of the last five years.

Texas fever, losses from which run into thousands of dollars in many Western states is reported exterminated in California, though two-thirds of the state was under federal quarentine for this disease in 1910. But for the eradication of Texas fever many of our cattlemen would have been forced out of business in the last few years. In view of recent marketing conditions a federal embargo on shipments due to Texas fever would have worked a great hardship on the cattlemen of this state.

Glanders has also been totally wiped out, according to the announcement. In 1912 more than 1,500 horses, out of 3,700 tested for glanders, were lost. The Mallein test was applied to 1,200 animals in 1920 and only 200 were found infected. Scarcely a case of glanders has presented itself during the present year. In this connection, Dr. Jackley asserts the development of motor transportation has not decreased the number of horses in California and that there are practically as many horses in the state today as there were in 1912.

The report also points out that activity of the department has kept foot and mouth disease, rinderpest and dourine out of California.

## COW TESTING IN LOS ANGELES COUNTY

Supervisor L. J. Birge reports regarding last month's test in the Southern Los Angeles County Cow Testing Association that C. V. Harris owns the highest producer of butter fat in a cow with 90.9 pounds. The highest herd test, 4.92 per cent, was shown by a herd owned by J. P. Wiesel. The highest average butterfat was shown by the herd of A. C. Straathof.

## The Tester Knows

The only sure and accurate way to determine just how close your separator is skimming is by means of the Babcock Test, and the most accurate operators of the Babcock Test are the cow testers employed by the various cow testing associations. The following statements from cow testers are interesting:

—"The closest skimming of milk I have in this association is done with a De Laval. Of the 29 separators in this association 16 are De Lavals."—Tester for the second largest association in Minnesota.

—"De Laval Separators and Milkers are to my mind superior to any other makes. The separator is the most efficient skimmer of milk and its durability is lasting. In this community we have practically all De Laval Separators."—Tester for a Pennsylvania association.

A De Laval soon pays for itself and is sold on such easy terms that you can use it while it is doing so.

### Lameness

Mare had hurt hip a few years ago and since hits herself on the other leg. I put a pad on the leg and think I got it too tight and that leg swelled. Sometimes when I work her a little too hard she goes very lame. She goes very lame on what seems to be the good leg and is all right on the other. It looks to me like a wind gall. Please advise me what to do for it.—Subscriber, Petaluma.

Those swellings on the inside of the ankle have been called wind galls but there is no air in them. It is a bruised joint and hard to cure while she is hitting it occasionally. Put a bandage on loosely at night and wet it with water and vinegar, half and half. If you can get a blacksmith to shoe her so she will not strike the ankle she will be all right. When she is tired she is more apt to hit it. Work her carefully and keep her on level ground as much as possible.

### Fighting Dogs

I have an Airedale and Bull Terrier, both males, that are all the time fighting and have to be separated. They are valuable dogs and needed on the ranch. What can I do to teach them to be friends?—Subscriber, Highland.

They are both of the fighting kind but can be taught to do better. Put a good collar on each one with a ring on it and get two lead chains. At night tie them where they can not reach each other. In the morning turn them loose with the collars on. Also get a good, heavy whip and tie a knot in the end of the lash. When they get to fighting yell at them, which they will probably not heed at first. When they get really at it get the whip and join the fight. Get someone to snap a chain in each ring but do not pull them apart. Whip them until they quit and then whip them some more and tie them up until the next morning. Don't whip one more than the other and don't scold them any other time. When you feed them their supper pet them and let them know you are their friend except when they fight. Do not feed them any meat. After a few fights one yell will will stop the trouble but tie them up until the next morning. If you are good to them at other times you will soon get their confidence but do not pet one more than the other. They detect partiality very quickly and that will start the trouble again. Do not let anybody else feed them. Do that yourself and give them most of their feed at night; very little in the morning and none at any other time.

### Blood in Passages

I have a cow that has been milking about four months until a few days ago when she suddenly failed on her milk and became very sick with what I would call diarrhea. For the past three weeks she has been showing more or less blood in her passages. I gave epsom salts which seemed to stop the diarrhea but the bloody passages continue. Since being fresh this cow has been kept in pen and is being fed dry alfalfa and mill feed. Another cow that is kept in the same pen and fed the same kind of feed is also showing blood in her passages. What is the cause and what is the remedy?—Subscriber, Dyerville.

Something wrong with the feed or water. Change to green alfalfa or pasture if possible. Change mill feed also and examine the water. Watch

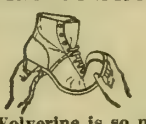
**Secret Tanning Process Makes This Leather *Stay* Soft**

Every man knows what it is to dry out wet shoes. The leather dries out stiff as a board, hard and uncomfortable.

Now this discomfort is ended. For, thanks to our exclusive, secret, double-tanning process the Wolverine shoe dries out after every soaking as soft as new buckskin. *This amazing shoe stays soft.* No other shoe made is like it!

We tan the leather in our own tannery.

**WOLVERINE Comfort Shoe**



This Wolverine is so pliable and soft you can double it up like a moccasin. It wears like iron but you'll hardly know you have a shoe on, it is so soft and easy.
For tender feet, or where you do not encounter wet weather, wear this Comfort Shoe. A blessing to the feet.

We take selected horse hide of the superfine quality formerly used for expensive Cordovan shoes and Cossack saddles—the toughest, longest-wearing leather known. Yet by our secret tanning process we give this wear-resisting leather the softness and pliability of buckskin. It never loses its softness—and it wears and wears and wears. For we even increase its natural durability.

**Unusual Economy**
**Work Shoes for All Purposes**

We operate our own tannery and our shoe factory as one organization. This effects very large economies. So every Wolverine shoe is very low priced when you consider the quality.

There is a Wolverine for every use. For field and shop, for lumbering and hunting, for the mines and the oil fields. The hi-cut model shown assures dry, warm feet in blizzard weather. The ever-soft leather in every model assures perfect comfort always. This new-day shoe is the one all men want.

If your dealer cannot supply you we will see that you are supplied. *Send the coupon for catalog.*

the surroundings and see that nothing gets into the feed that does not belong there. Give these powders: Two ounces tannic acid and four ounces powdered gentian. Mix and divide into 24 powders. Give one powder in the feed once a day to each cow.

### Kidney Trouble

I have a horse that seems to eat and drink well but his hind parts are weak and he almost falls down when he tries to run. He urinates quite often but not very much at a time and the urine is very yellow. Could it be kidney trouble?—Subscriber.

Yes, the trouble is with the kidneys. Rub in a good liniment over the kidneys and give these powders in the feed: Four ounces nitrate of potash, four ounces bicarbonate of soda, four ounces powdered gentian and one ounce nux vomica. Mix and divide into 16 powders. Give one powder morning and evening for four days then one a day while they last.

### Blood in Milk

I see in the Cultivator a cure for blood in milk. I have a cow that is giving bloody milk and would like to try the remedy suggested, poke root, but the amount is not given. It says a small package at three doses but my druggist has it only in bulk. Will you tell me something more definite as to the amount? Will it dry up the milk and if so will it come again?—Subscriber, Dos Palos.

We are not familiar with the use of poke root as a medicine; that formula was handed in by a friend. Poke root is not given in the list of medicines, but it is not poisonous, so you would be safe in giving half ounce doses. We do not think it will dry up the milk.

### Lumps

Have a milk cow with two hard lumps behind each jaw bone. They are free from the bone itself. Could it be enlarged tonsils or is it probably due to foxtail grass? Would it affect the milk for family use if they are not opened?—Subscriber, Woodlake.

It is hard to tell what causes the lumps. It may be tuberculosis. We would want her tested for tuberculosis before using the milk. We would also advise opening the lumps and cleaning out the contents so it will not absorb and be scattered through the system.

### Extreme Case

Bought a cow in May at a good price, that was giving five gallons of milk, and on the fourth day her udder became inflamed and was covered with large pimples that looked like boils. We used liniment and salve and it got better but again swelled up to three times its normal size. We called a veterinarian who gave her some medicine and told us to rub the udder and bathe it with warm water. The udder has improved but she gives no milk. She has eaten very little and is very thin in flesh. Now she has large lumps just above her hocks that make her very lame. What would you advise doing with her? Would like to fatten her for the butcher as we do not think she will be a good milch cow again.—Subscriber, Merced.

We would not advise trying to do anything with her. We would not like to use the milk or meat from such an animal and it would probably cost as much to fatten her as you would get for her. Better destroy her.

## PLANNING FOR BIG MEETING

Dr. Van Norman has just returned from an extended trip to the dairy countries of Western Europe. He represented the state department at the annual conference of the International Institute of Agriculture, at Rome, Italy, early in May and afterwards visited government officials, scientists, business men and social workers in Italy, Switzerland, France, Belgium, Holland, Denmark, Norway, Sweden, England and Scotland to discuss with them plans for the World's Dairy Congress, which is to be held in one of the leading cities of the United States early in October, 1923. It will be the first international dairy meeting to be held in this country and the most ambitious ever held anywhere. President Harding has invited 150 nations, colonies and commonwealths to send representatives.

## AMERICAN CATTLE FOR EMPTY MEXICAN RANGES

A barometer on Mexican conditions may be the recent strong movements of American cattle across the border at Nuevo Laredo. Approximately 3,200 head destined to the depleted Mexican ranges and empty slaughter houses entered that country in July. Such a large movement of American cattle to Mexico in one month is a record for that point, since the cattle movements in recent years have all been the other way. According to Consul Harry L. Walsh, Nuevo Laredo, the Mexican cattle supply in the country as a whole would seem far below normal, in view of the drain on the ranges for the last five years, with no offsetting breeding or restocking. This understocked condition is further borne out by recent importations of Argentina animals for slaughtering.

## Livestock News Notes

### LIVESTOCK SALE CALENDAR

October 26, C. W. Anderson, Burbank.
November 16, Dispersal, Arthur & Maxfield Holstein Co., Hanford.

The annual meeting of the National Dairy Union will be held at the Hotel Ryan, St. Paul, Minnesota, October 12, 1922, at 11 a. m., for the election of five directors and to transact such other business as may properly come before the meeting. This meeting is to be held in connection with the meeting at the same place and date of the National Creamery Buttermakers' Association, and after the necessary business of the National Dairy Union meeting is transacted, the two organizations will unite in varied and interesting program and join in a banquet in the evening.

The premium list for the second California National Livestock Show at San Francisco is ready and may be obtained from John A. Bunting, secretary, at 402 Merchants National Bank Building, San Francisco. This is a big show for the cattlemen and large prizes are offered.

The Brown Bulb Company of Santa Cruz has sold the Guernsey bull Toreador of Santa Cruz to Gamboni and Van Gordon of Cambria. The calf is out of the same dam as Primrose Third's Lucy who has recently finished a record of approximately 600 pounds fat in class D D.

Jennie Lea Hengerveld, owned by Arthur and Maxfield Holstein Company, Hanford, has completed a record of 33.41 pounds butter from 678 pounds milk in 7 days, after completing a 305 day record of 801.2 pounds butter from 19,118.4 pounds milk at her previous freshening. Her full sister, Matty of Sunnyside, has completed a 365 day record of 931.2 pounds butter from 23,122.8 pounds milk in the same herd. These two splendid producers are full sisters, sired by Arcady Pontiac Wayne Hengerveld, and out of Matty of Riverside, a daughter of Juliana King of Riverside. Both of them are high class as individuals.

Rosamaines Cora Jarie, a senior two year old daughter of Rosamaines Pontiac Netherland, lately completed a record of 22.83 pounds butter from 404.7 pounds milk in 7 days. Her dam, Cora Jarie Pontiac, has records of 976.55 pounds butter from 18,993.8 pounds milk in 365 days as a junior three year old and 33.34 pounds butter in 7 days at 5 years. This good heifer is owned by M. P. Christensen, Norwalk. The great heifer, Eldorado Veeman Segis, also owned by M. P. Christensen, that made 25.48 pounds butter in 7 days as a junior two years old lately made 20.16 pounds butter from 397.7 pounds milk in 7 days eight months after calving, and she is due with her second calf in October.

One hundred and four lads from the various high schools joined in a progressive judging contest held in the San Fernando Valley on Thursday, September 28, as a preparation for the contests to be held at Riverside and Pomona during their respective fairs. G. W. Gordon of the farm bureau and Howard Miller of the chamber of commerce were in charge and were assisted by the agricultural teachers of a number of the schools. The Orcutt, Brant, Craig and Hartsook ranches were visited. Ralph Stokes of Long Beach was first in the contest, Harold Reush of the same school was second and Richard Tatsch of Gardena, third.

Lady Mechthilde Jewel, owned by Pottenger Sanatorium Co., Monrovia, has completed a 365 day record of 979.2 pounds butter from 25,935.7 pounds milk as a senior four year old.

The annual meeting of the California Holstein Friesian Association was held at the state fair grounds, Sacramento, on the evening of September 4. The 15 directors for the coming year were elected as follows: Fred Hartsook, Lankershim; Kenneth W. Abbott, Los Anfieles; R. A. Condee, Chino; Wm. R. Harriman, Hondo; W. J. Higdon, Tulare; Frank M. Helm, Fresno; F. L. Hogue, Modesto; J. M. Campbell, Escalon; Fred W. Kiesel, Sacramento; F. L. Morris, Woodland; DeLancey Lewis, San Jose; E. Swift Train, San Francisco; J. W. Snodgrass, Hueneme; E. N. Brown, Palo Alto, and H. V. Bridgford, Patterson. Officers were elected as follows: W. J. Higdon, president; Fred Hartsook, first vice president; E. N. Brown, second vice president; C L. Hughes, secretary-treasurer. The secretary-treasurer reported the finances of the association in splendid condition, with a balance of $5,567.35 in the treasury. It was voted to duplicate the prizes offered by the California Agricultural Society in the Boys' and Girls' Calf Club classes at California State Fair, beginning with 1923. Every member present pledged himself to secure at least one new member to the association.

The initial shipment of "The California Holstein Breeders' Annual for 1922," a 112-page booklet, and "California Holstein Facts", a 16-page booklet, have arrived and have already been mailed out. The balance of the "Annual" will not be available for about three weeks. Of the "Annual" 4,000 copies were printed and of the "Facts" 5,000 copies, all of which will be mailed free as long as they last.

With an average of $413 per head the Maxwell Farms sale once again demonstrated the strength of the California market for good Holsteins. And even with that substantial sale average there were many great bargains among the tops.

**No More BLACKLEG**

There is no need to suffer losses from this very prevalent disease.

Insist upon your veterinarian employing Fort Dodge Blackleg Aggressin, one dose of which will give immunity for life.

**Fort Dodge Blackleg Aggressin**

It is a scientifically prepared GERM FREE Blackleg Vaccine. It is impossible for our product to set up Blackleg.

It is prepared from tissue juices of calves previously inoculated with the true Blackleg organism.

It has been used for many years by leading veterinarians on many of the foremost herds in the country.

It is produced in our large up-to-date laboratories, under U. S. Bureau of Aminal Industry Inspection. Write for free literature today.

**New Lamp Burns 94% Air**

**Beats Electric or Gas**

A new oil lamp that gives an amazingly brilliant, soft, white light, even better than gas or electricity, has been tested by the U. S. Government and 35 leading universities and found to be superior to 10 ordinary oil lamps. It burns without odor, smoke or noise—no pumping up, is simple, clean, safe. Burns 94% air and 6% common kerosene (coal-oil).

The inventor, W. V. Johnson, 31 N. Fifth St., Portland, Ore., is offering to send a a lamp on 10 days' FREE trial, or even to give one FREE to the first user in each locality who will help him introduce it. Write him today for full particulars. Also ask him to explain how you can get the agency, and without experience or money make $250 to $500 per month.

**Auto Men Earn Big Pay**

YOU CAN HAVE THAT GRAND AND GLORIOUS feeling when you tear open a fat pay envelope every week and count $40 to $75 in greenbacks. Learn autos. Be a mechanic, electrician, demonstrator, salesman. Good jobs open to trained men now. YOU can learn by National practical shop training. Easy, quick course; use tools, no books. Learn everything under experienced mechanic instructors. Special Advanced Electrical course FREE.

**Big-Pay Jobs Open For You NOW**

Send for wonderful big FREE auto book. Tells of jobs open to National trained men. How to start in business yourself. How you can earn room and board, and a little more, while learning. Tells everything about National, the oldest and biggest school. Send for this wonderful 72-pg. illus. book. Write today.

**REGISTERED HOLSTEINS**

"Sons from Worthy Dams" for future herd sires in Holstein herds, for sale at all times. We have developed 17 cows with records from 1000 lb. up to 1448 lb. butter and their offspring are show ring winners. Herd under Federal supervision. Write us your needs.

1058 Stuart Building
Seattle, Wash.

Carnation Stock Farms

One of the most remarkable production records ever made in California was disclosed in the Maxwell sale by the heifer Rosamaines Dora Netherland. She calved at 2 years 1 month and in 365 days made 1,002.8 pounds butter from 21,770.4 pounds milk, making her the second 1,000 pound junior two year old in California. The remarkable thing about her record is the fact that her test period was started 60 days after calving. In other words, this great heifer made over 1,000 pounds butter in the last 12 months of a 14 month lactation at first calving. She is an intensely line bred heifer, being by a son and out of a daughter of King Potiac Netherland Segis 3d, while her second dam is a daughter of King Pontiac Netherland Segis, sire of King Pontiac Netherland Segis 3d. She topped the sale, going to Fred Hartsook at $1,600.

Although King Segis Alcartra Prilly was absent from the show ring at California state fair this year, his name was frequently heard around the ring side, and especially after the grand championship award had been placed upon the great young sire, Prince Aaggie of Berylwood, owned by Berylwood Stock Farm, Hueneme, for the new champion is a 100 per cent brother to the sire of King Mead Colantha Prilly, the splendid youngster Bridgford Holstein Co. now have in service on the daughters of King Segis Alcartra Prilly.

Owing to interrupted freight service which has delayed the complete transfer of the E. C. Schroeder herd from Minnesota to California, the public sale scheduled for C. W. Anderson, Burbank, on October 26, has been indefinitely postponed.

Because it conflicted with Kings County "Pork Day", the dispersal sale of the good Arthur & Maxfield Holstein Company herd of registered Holsteins has been set back one day and will be held on November 15. This herd is one of the choice collections sold this year, including a number of high yearly record cows, a 33 pound show cow and others with excellent records.

M. A. and B. A. Edwards, Escalon, recently completed a record of 832.2 pounds butter from 19,521.6 pounds milk on the nine year old cow, Kabo of Linwood. In the same herd the junior four year old Mechthilde Aralia Walker made 589.87 pounds butter from 14,138.3 pounds milk and the first calf senior two year old Durasia Pontiac Torchlight made 509.70 pounds butter from 9,902.3 pounds milk in 305 days.

Segis Pontiac Charlotte De Kol, a senior two-year-old daughter of Segis Pontiac De Kol Burke, owned by F. F. Pellissier, Whittier, lately made 18.42 pounds butter from 458 pounds milk eight and one-half months after calving. This is the highest milk record in this class and division of which we have record in California.

With a class of 18 aged cows at California state fair this year, five of them with records above 1,000 pounds butter in one year and a number of others with very large records, the public was given a view of combined type and production such as has never before graced a show ring in California, and possibly nowhere else.

Members are reminded that it is time to think about the top animals for the 1923 Guaranty Sale, which will be held at Tulare. The committee always gives preferences to the good ones that are heavy with calf.

# Winners in Southern California Egg Laying Contest

The Southern California farm bureau egg laying contest which has been conducted at Pomona for the year beginning October 1, 1921, has just closed, showing exceedingly keen competition and very good production right through. Birds have not been forced in the slightest, but have been subjected to conditions which might be found on the good commercial poultry ranch. No lights have been used at any time during the year and the ration has not been a forcing one. By this policy it was proposed to give the birds every opportunity to make good production and yet be in good condition at the end of the year so that the owners might take them home and use them with good success for breeding purposes. The results obtained and the condition of the birds at this time show that the directors were justified in their policy as the birds are finishing the year's work with very creditable records and in excellent condition. It must also be remembered in considering these records that at the beginning of the contest extremely unfavorable weather conditions were encountered which threw practically every bird in the contest into a molt and resulted in very low production in the first three months of the contest, in fact, some birds did not lay at all until after January 1. In spite of this setback the birds have been improved in condition and have come through the latter part of the year exceedingly well.

The second year's contest is under way with every indication that far better results will be obtained than on this yast year's work. The winners for this past year are:

Highest Pen (10 birds)—1, Geo. C. England, Inglewood; 2, M. L. Frick, Los Angeles; 3, E. E. Rogers, El Cajon.

Highest Individual—1, E. E. Eisenberg, Riverside, 274 eggs; 2, Geo. C. England, Inglewood, 261 eggs; 3, M. A. Schofield, Gardena, 260 eggs.

In the hen contest, beginning October 1, there have been entered 39 White Leghorns, 1 Ancona, 4 Rhode Island Reds, 2 Light Brahmas, 1 Barred Rock.

The Rhode Island Red pens entered are from the flocks of Ferd Heying, Anaheim, and M. & M. Ranch, Van Nuys, Buechner & Ridley, San Diego; C. W. Norton, Pomona, and Alvin E. Bloch, Costa Mesa, are offering Ancona pens.

The White Leghorn entries are as follows:

L. G. Wiley, Van Nuys; Moses L. Frick, Los Angeles; J. L. Miller, La Verne; Fliniau & Furstenfeld, Van Nuys; W. E. Gainsley, Torrance; F. R. Richardson, San Gabriel; Bonnie Brae Farm, Burbank; Thomas J. H. McKnight, Chula Vista; Will S. Hatch, Tustin; Hoover Brothers, Pomona; J. D. Zimmerman, San Gabriel; R. A. Whitaker, Lakeside; F. M. Molby, Los Angeles; California Leghorn Breeders, Inc., Lemon Grove; Mrs. Mary B. Suits, Riverside; Edward E. Eisenberg, Riverside; R. C. Gibson, Newhall; B. S. Smallwood, Upland; James R. Scott, Chula Vista; M. L. Stahl, Claremont; Fontana Farms Company, Fontana; A. L. Swinton, Van Nuys; Longacres, Baldwin Park; Bellows Egg Ranch, Lakeside; George B. Wilken, La Mesa; Charles Hudson & Son, Escondido; E. E. Rogers, El Cajon; Mrs. Pearl Wilcox, Ramona; George C. England, Inglewood; Blackford & Mumford, Los Angeles; Charles G. Weaver, Los Angeles; A. M. Harrison, Van Nuys; Mrs. V. Crow, San Diego; Mrs. Mary Eads, San Gabriel; J. J. Forbrick, Arcadia; D. A. Didricksen, Arcadia; Baake Brothers, Highland; S. H. Park, Pomona; L. G. Hack, Pasadena; H. M. Stone, Gardena; W. H. Young, Downey; W. A. Evans, Sierra Madre, and M. A. Schofield, Gardena.

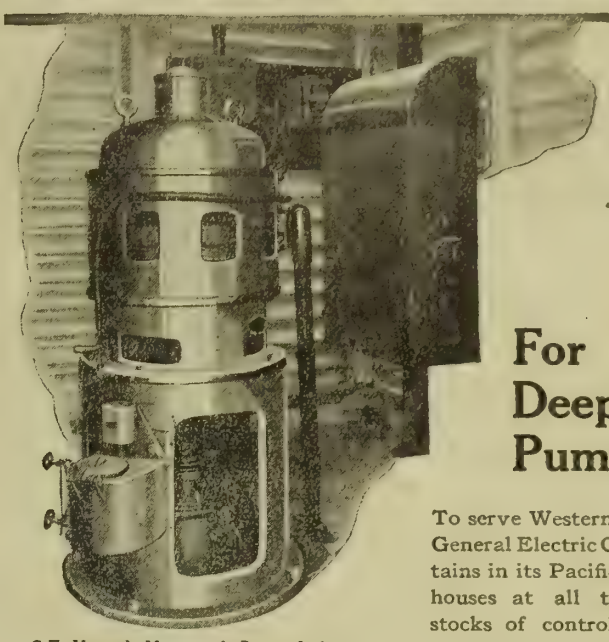
### MAKE IT TWO

Did you eat your half an egg this morning? According to the United States department of agriculture the per capita consumption of eggs in the United States is one-half an egg a day.

The department suggests that everyone not only get his full share of eggs but eat the whole egg. Eggs are comparatively cheap just now. More eggs have been laid this year than ever before. The total runs up to something like 22 billions, an increase of ten per cent since the armistice.

The Cultivator suggests: "Make it two."

G-E VERTICAL MOTORS



G-E Vertical Motor and Byron Jackson Turbine Pump recently installed at Stockton, California.

A few of the many California organizations and farmers using G-E Vertical Motors are listed.

Kirkman Nursuries, Inc., Madera

*Dividend checks from the American Telephone and Telegraph Company are received quarterly by more than 200,000 telephone users.*

# Owned by those it serves

Less than fifty years ago an application was made for a patent which created the possibility of speech between distant points. It was the culmination of years of study, research and experiment. It suggested a new aid in commerce and domestic life; a new tie to bind the people together. But it was only a suggestion—a dream.

To make that dream come true required the creation of an organization unlike any other. It demanded a kind of scientific knowledge that was yet to be formulated, as well as a type of equipment still to be devised. And it necessitated the financial and moral support of many communities.

Out of this situation grew the Bell System, bringing not only a new public service, but a new democracy of public service ownership—a democracy that now has more than 200,000 stockholders—a partnership of the rank and file who use telephone service and the rank and file employed in that service. The American Telephone and Telegraph Company exists to serve the people and is owned directly by the people—controlled not by one, but controlled by all.

Evolution is going on. Each year the ownership is more widespread. Each year the various processes of the service are performed more efficiently and economically. Each year new lines and extensions are constructed. The responsibility of the management is to provide the best possible telephone service at the lowest possible cost and to provide new facilities with the growth of demand. To do these things requires equipment, men and money.

The rates must furnish a net return sufficient to induce you to become a stockholder, or to retain your stock if you already are one; after paying wages sufficient to attract and retain capable men and women in the service. They must adequately support and extend the structure of communication.

These are considerations for the interest of all—public, stockholders, employees.

THIS MONTH

(Continued from Page 357)

and Black Spanish in rows 18 inches apart in rich soil.

**Onions**

An early sowing of California Red, White Bermuda and Pearl may be made this month on richly prepared soil in rows two feet apart. This plot must be well manured and soot or wood ashes dug in are very beneficial.

**Berries**

The strawberry plot should be given attention and manure applied to establish plants. New plots may be planted in rows two or three feet apart. Brandywine, Banner, Marshall and Everbearing are the best to grow.

## Southern California

By D. F. Reichard

THERE is much to do about the garden during this month. All your growing stuff and recently planted seeds must be watched closely to see that they do not want for moisture. This time of the year is the most trying to keep sufficient moisture in the soil on account of evaporation. Cultivate as soon as possible after irrigating to keep the ground from baking and the moisture from evaporating.

Clean up what is left of the past summer's growth. Burn all infected plants, the others put into the compost pile or turn into the soil. The more of this litter that can be put into the soil the better your land will be. We cannot expect to keep taking stuff from the land without putting something back. Besides the roughage accummulated about the garden there should be added during the fall months fresh barnyard manure. This should be strewn over the ground to be leached in by the early winter rains and later be turned under.

On growing plants where these manures can not be worked in at this time of the year an application of high grade fertilizer is very desirable and will give your plants the desired growth. In planting one's garden the space should be so arranged as to give it roughage once in two years.

Plantings during this month will consist of the more hardy vegetables. Sow seeds of beets, carrots, cabbage and cauliflower, Swiss chard, endive, chicory, New York, or Los Angeles Market lettuce, leeks, parsnip, radish, turnip, winter spinach, peas, Laxtonian for a quick crop and Stratagem or Senators for a little later. In protected foothill sections put in Canadian Wonder beans. It is too late now for pole beans, melons, squash or cucumbers. October is one of the best months to put out garlic and onion sets. Put out plants of cabbage, cauliflower, lettuce and kale.

Store your mature winter squash and pie pumpkins as an early frost may do them some harm. Sweet potatoes should be dug and stored. Take them up carefully so as not to scratch or bruise them. Pack the perfect potatoes in dry sand or wrap in newspapers and store in a cool, dry place.

## Southern Arizona

By M. E. Bemis

OCTOBER is a more favorable month for planting vegetables than either of the two preceding months, for germination of the smaller seeds is more easily accomplished and there is also less danger from insects. Grasshoppers always take their toll of young plants at this season of the year. One gardener reports that he has sustained considerable damage from crickets this season. The early plants from seed planted in September will have a start that will place them far ahead of those planted in October, but the October gardener has the satisfaction of being more confident of securing a perfect stand of plants

A list of plantable things for October is very similar to that of September except that beans are off the list until next spring Beets, carrots, lettuce, parsley, peas, radishes and turnips may be planted now Most of these can be planted also at any time through the winter Thorough preparation of the seed bed will pay good

dividends in strong germination and vigorous plants

Now is the time to put out cabbage plants and cauliflower Possibly for the home gardener it might still be safe to plant cauliflower and cabbage in the garden where they are to remain, thus avoiding the setback of transplanting. However, it is much better this late in the season to purchase the plants.

Cauliflower should be set in rows 24 inches apart and 14 inches apart in the row. The Henderson Early Snowball and Large Pearl have done well in this section. At least one American grower reports some very excellent results from growing cauliflower.

Cabbage should be set out at this time. The small headed varieties or the Early Winningstadt and the Jersey Wakefield, Copenhagen Market and Danish Ballhead are all good round headed varieties. Cabbage should be planted in rows three feet apart and 18 inches apart in row. Cabbage is a plant which should be thoroughly cultivated. Some growers claim that the secret of good cabbage is continuous cultivation.

There is plenty of time to plant lettuce for home garden or for late marketing. In fact lettuce can be planted any time until spring. Most of the market crop for shipping is planted early.

Spinach also may be planted in October. This is one of those crops which does exceedingly well in the Salt River Valley and is worthy of more attention than is commonly given to it.

Both onion seed and onion sets are in order for October plantings. The late variety of garden peas may also be planted. Peas planted now should have a chance to develop a good system which will carry them over nicely through the winter and enable them to make a good vigorous start when the warmer days in February and March enhance th growth of plants.

Earnest effort has been made throughout the Salt River Valley to make September a cleanup month. Those who have cleaned out chicken houses and yards, have cut the weeds and done away with the rubbish, will find if they utilize the fertilizer from the chicken yards on the odd corners where weeds have grown and prepared this for gardening purposes, they at least have a beginning for a most excellent winter garden.

Winter gardening in southern Arizona has all the pleasures of gardening in any part of the country and less of the disadvantages attendant to most places because there is a smaller growth of weeds and less trouble from insects than in the warmer parts of the year. The satisfaction of having fresh vegetables, to say nothing of the economic side of the matter, should be the inducement for a greatly increased acreage of winter gardens.

## WHAT IS THE BEST PEAR STOCK?

(Continued from Page 357)

that Mr. Coates makes no statement that he is not absolutely sure of and would conform with the best knowledge we have today on pear stocks.

Some very strong statements have been made recently regarding the immunity of some particular pear stock to gummosis or pear blight, particularly in regard to the so-called usuriensis. In Mr. Coates' article he has very clearly shown the weakness of this usuriensis and the variation of the different types of seedlings, and we shall all wait with interest his experiments in Lake County. In this connection I might point out here that there would be no such variation in the Angier quince stock, as these root stocks are grown from cuttings and I believe that pears, grown on the quince stock, are less susceptible to blight than any other stock has proven to be up to the present.

Mr. Coates has certainly not exaggerated the productive qualities of the pear on quince; as we have approximately 120 varieties of pear in bearing on quince root. In size and quality of fruit, as well as quantity production, in proportion to the size of the trees, I do not believe that they can be equalled.

In statements made to the public I think we should all be very careful that we do not lead them to believe that any particular stock has as yet proven its immunity to blight, as it would take years of experimenting to prove any stock immune.

Mr. Coates' article is so clear that I do not believe it necessary to add anything to it.

* * *

By J. E. Bergtholdt

Mr. Coates has covered the ground very ably. Supplementally, however, I would state that Mr. Coates' observation of the performance of the Japanese pear, or calleryana, was mainly under coast valley conditions where much of the soil is very heavy and waterlogged.

While it is true that the French pear will endure more moisture than the Japanese, and that for the heavy black lands of the coast valleys the French is to be preferred to the Jap as a root stock, yet in our interior valleys and foothills we find little difficulty with the Japanese root with wet feet. On the average it will endure any location adapted to Myrobolan plum root, though sometimes in the interior there are some locations of such slow drainage that the French is to be preferred.

The Japanese root stock is practically blight resistant, is less inclined to sucker, than the French, in orchard, and as such should be given some preference where a resistant stock is desired.

The blight resistance of the usuriensis, (from which seeds are commercially available) as a root stock has been very much overrated, though it is true that some individual trees of usuriensis have been discovered that were blight resistant.

As Mr. Coates, however, has pointed out, it will be impossible to make any dependable seeds from these individual specimens commercially available, in any event not for a great many years.

These individual specimens, however, could be multiplied by propagation, and the product of this propagation could be used as a blight resistant medium between the root stock and the fruiting variety double-worked upon it.

Theoretically that looks fine, practically, however, it is of small benefit. For the double working to be of greatest efficiency it would have to be done into the third branches, or approximately the fourth year, which would occasion a loss of at least two years in bringing your orchard into bearing.

About one in ten average tree planters would do this top-working successfully.

Under a severe blight attack even your top-worked tree would be subject to a loss of its top and would require a period of at least four years to restore a new top from the resistant branches.

In practical orcharding the double-worked tree will never solve the blight problem. The best safeguard against blight is intelligent, diligent, persevering cutting.

## BEANS ARE NITROGEN GATHERERS

Reading an article in a recent issue of the Cultivator regarding the ability of beans to store nitrogen in the soil and headed by "The facts are these," it seems to me the writer has jumped at conclusions. This is a matter to be threshed out in an unprejudiced way. Most of us are always ready to learn something and sometimes a friendly argument helps to clear matters up. I think there are too many farmers who fail to appreciate the good work the agriculture department has done for us whether they be high brows or whatever you are minded to call them. It is common knowledge among Lima bean growers that where land has been in hay for a number of years that beans won't yield nearly as much the first year as the year following. This does not prove, however, that beans would do well on any kind of soil farmed continuously for an indefinite period, although I have seen ground which has grown Limas for over 20 years with no fall off in the yield. With the small bean in this locality (Arroyo Grande) they claim the soil is losing its fertility and most farmers plant hay one year and beans the next. Small beans for some reason seem to be harder on the soil than the Lima. The fact that beans have given a lower yield the past few years does not prove conclusively the land is wearing out. It must be remembered the rainfall for the last five years has been short with the exception of the present year and a full yield could not be expected under dry farming conditions. Climatic conditions are a great factor in the yield of beans and I have heard lots of complaint from the Lima district of beans taking second growth when this occurs. There is no question that beans are heavy users of nitrogen, but this does not disprove the fact that they add nitrogen to the soil. This is pretty well demonstrated by following beans with hay. As I see it our scientists would have nothing to gain by misleading us and would have to be shown your statements to be truths before giving them to the public. If the remedy is simple and inexpensive we farmers are waiting to hear it.—F. P. Thoms, Arroyo Grande.

### GREEN FORESTS

**For Sale**—Registered pure Toggenburg Bucks and Buck Kids, Bismark and Chieftan blood. Extended pedigree and low prices, apply Francis H. Rudkin, Fillmore, California.

## SUBSOILING AND DEEP IRRIGATION

(Continued from Page 355.)

in a place without danger to the rooting system, depending somewhat on the nature of the soil, and I suppose, previous mode of cultivation.

Let me say that I have been following that line of procedure with gratifying results. For instance, previous to my irrigation the early part of August, I subsoiled at an average depth of about 18 inches twice in a place crosswise (trees 22 by 24 feet) and only furrowed lengthwise.

I found after irrigation that the subsoiled places were practically all wet thoroughly in the tree row, from furrow to furrow, even where they looked on the surface to be dry.

Prior to the early September irrigation I cross-furrowed, then subsoiled twice in a space lengthwise, and furrowed lengthwise four furrows, letting the two outside furrows run in the subsoiled places, making these very deep.

It was remarkable how the water went down in those subsoiled furrows, and, as Mr. Lehr stated, the water went down and left the surface mulch more or less dry. This makes the cultivation much more satisfactory, and my trees in spite of the late extremely hot weather are looking bright and fine and the soil seems to be retaining the moisture very satisfactorily. I cultivate about eight inches deep.

* * *

### J. M. Cook, Anaheim

I have read the article in your paper on subsoiling and deep irrigation, which has been discussed by several. I would suggest that the Visalia man try only subsoiling in center of his rows of trees, not often, but about twice a year, as he will cut more or less feeder roots at each time to get his water down below surface. Run a lister 10 or 12 inches deep, according to the root system, not cutting anything larger than lead pencil size, once, twice or three times in row, one way, according to width of trees, filling each lister furrow with bean straw, alfalfa straw or anything that will bring decayed vegetation, running water directly through bean straw, then covering with turning plow. This method will form a sponge of decayed vegetation to absorb mixture and hold it. This will also coax new feeder roots. The humus will break up hardpan. I know of several farmers using this method. Some use manure. I would not suggest manure buried in this way as it would burn feeders if enough was used to make proper bed of humus. On the Henry Wagner place in Anaheim he is using flake against flake of bean straw, three rows of which he puts in each row, from two to three bales to a tree—about 10 year old trees.

## PRESERVATION OF GRAPE JUICE

(Continued from Page 358.)

and sound grapes a temperature of 60 degrees Fahrenheit will be necessary to use one and one-half pounds of potassium metabisulphite per one hundred gallons of juice. Under very favorable conditions one pound would be sufficient. The corresponding amounts of 6 per cent sulphurous acid solution are one and one-half gallons and one-gallon respectively.

If the grapes are mouldy and if the containers are not sterile, it may be necessary to use two pounds of metabisulphite per one hundred gallons or two gallons of the 6 per cent sulphurous acid solution.

Any of the chemical supply houses in San Francisco or Los Angeles can furnish the above chemicals.

When it is desired to use this juice for beverage purposes it will be necessary to expel the sulphurous acid from it. This can be most conveniently done by heating the juice in an open wooden vat with an aluminum or tin steam coil to 165 degrees Fahrenheit and at the same time passing through the juice a vigorous stream of air until the juice loses the sulphur taste and regains its red color. It should then be heated to 180 degrees Fahrenheit and sealed in sterilized barrels, as directed above for barreling of juice. Such juices should not be placed in tin cans, because it will attack them. It can be bottled and pasteurized as directed above for bottling.

### Pasteurization by Storage

Juice prepared as directed for canning can be held in breweries or in other suitably equipped plants indefinitely at a temperature of 150 degree Fahrenheit. The juice should not be treated with sulphurous acid. It should however, be cooled as soon after pressing as possible by means of milk coolers, or the cooling machines installed in all big breweries, to a temperature of about 32 degrees Fahrenheit. The juice should then be run into storage

# AUCTION

**9-Acre Orange Grove at Escondido, California**
**Saturday, October 14, at 11 A.M.**

This very fine Orange and Lemon grove, just two miles from the center of the city of Escondido, California, in an absolutely frostless belt and in a wonderful valley for citrus groves.

All modern conveniences that one enjoys in the city and an up-to-date, new modern 8-room bungalow situated on the top of a gentle slope overlooking the valley. Beautiful large living room, fine fireplace, dining room, kitchen, 3 large airy bedrooms, sleeping porch, modern tile bath, breakfast room and den make a home that would be perfectly wonderful in any of the best residential districts in Los Angeles.

A little over seven acres in 4½-year-old Valencia and Navel Oranges and Eureka Lemons and 1 acre of Muscat grapes, plenty of water, well and pumping plant and cement irrigation lines over the grove.

Large double garage and good chicken houses. This place is positively wonderful, but on account of the failing health of the owner it must be sold at once to the highest bidder. Satisfactory terms arranged.

It is absolutely necessary for one to see this place to even in a small way appreciate it.

Drive east on Main street of Escondido and follow the arrows to the YORK RANCH, or apply at the Kinema Sweet Shop, Escondido, for directions. Any further information you may desire can be obtained from the Auctioneers.

# Breed and Broodiness

By Jean A. Koethen

IF broodiness could once for all be bred out of every hen of every breed it would mean an immense increase in egg production, for broodiness is the one worst enemy of production. A hen that goes broody every month or so, taking two weeks or more to get back on the job, can never be an efficient or profitable layer. The Mediterranean breeds are classified as non-sitters, and yet in many White Leghorn flocks broodiness is a problem, and few Leghorn commercial flocks are without their jails or broody coops.

Control of broodiness in White Leghorn flocks is a comparatively simple matter because the tendency of this breed is away from motherhood, and the broody is or ought to be an exception. The keeper of Leghorns has only to band every broody one and keep them out of the breeding pen, for like produces like, and it is breeding from broodies that keeps broodiness in a flock.

It is with the heavier breeds that broodiness becomes a real problem. Some broodiness must be allowed. The question is, how may it be reduced to its lowest terms, how kept within such bounds that it is a virtue rather than a fault.

### Don't Change Breed

Only recently a letter came to this office asking about the merits of a comparatively new breed and complaining of the extreme broodiness of a certain popular breed. That letter represents an idea that has prevailed more or less since poultry breeding began, i. e., that broodiness is a fault to which certain breeds are more addicted than others and that the only way to get rid of it is to change to another breed.

The truth is, broodiness is a characteristic of strain rather than of breed. Some strains of Leghorns are quite inclined to broodiness, and some strains of Plymouth Rocks and R. I. Reds quite free from it. Generally speaking, birds of Asiatic blood and breeds into which Asiatic blood has been mixed are more inclined to broodiness than others. The Cochin, for example, is a great sitter, and the Orpington, particularly the Buff Orpington, which has a good deal of Cochin blood, follows its example. The Light Brahma, which is also Asiatic, is, as far as my own experience goes, less broody than the Orpington, but it is never safe to generalize because broodiness is so very largely a matter of breeding. Some strains of R. I. Reds are now advertised as practically non-sitters because careful breeding has so nearly eliminated broodiness.

The ideal hen is a bird that lays an egg every day or oftener, hatches and rears a family once a year and makes a good potpie when her laying days are over. If hens of the heavy breeds could be brought to the point where they would go broody only when mothers are desired and would lay steadily the rest of the time they would give the little White Leghorn, splendid hen that she is, a run for her money. The public likes a hen that is good for every purpose, and the man who develops such a breed will find his fortune made. Meantime let us all do what we can to get rid of broodiness in the hens we have and not go hunting for something better.

### Breeding Out Broodiness

All breeding is a matter of selection. When we breed from the very best we have we shall find some of the offspring better than the parents and some not so good. The majority will be no better, but there may be here and there one that is better. It is these better birds that must be successively used as breeders, to the exclusion of everything of inferior quality, till the ideal is reached.

Step by step lifts bad to good,
Without halting, without rest,
Lifting better up to best.

Obviously the first step in breeding out broodiness is to know which hens go broody once in a season, which more than once, and which never go broody at all. To this end every hen that goes broody should be banded. If she goes broody a second time, band her again. This is some trouble in a large flock of the broody varieties, but the end justifies the trouble.

At culling time, if there are not too many of them, the hens that have gone broody more than two or three times may be sent to market. I say "may," because there can be no fixed rule in such matters. It depends on how large the flock and how great the number of broodies. Still, I think a man who in September found that the majority of his hens had gone broody three times since January would probably do better to let them all go or to eat them. At any rate, whether he decides to try them for another year or to get rid of them, the one thing he must not do is to use them as breeders. If there is a single hen that has not gone broody she must be used for breeding cockerels. Other hens that are only moderately broody may be used for general breeding but the mothers of breeding cockerels must be non-sitters if any are to be had.

Using the best hens as mothers will never breed out broodiness unless the sires are from non-sitting mothers. This is the crux of the whole matter. Mate your non-sitting hen to the son of a real broody hen and the offspring will be more broody than the mother. Both fecundity and broodiness, which is its antipode, are passed from mother to son and from him to the grand daughters, rather than from mother to daughter, hence the extreme importance of breeding cockerels from the non-sitting hen.

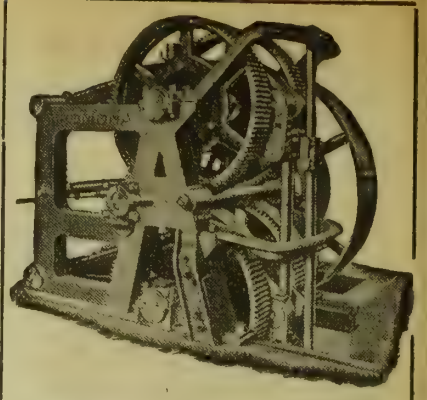
It may not be possible to save a whole setting of eggs from a single hen, but it will be worth while to set only a half dozen on the chance of getting the right sort of breeding cockerel. To avoid wasting the sitting hen's time and also prevent getting the chicks mixed eggs of some other breed may be put with those from the special hen. The chicks of this mating should be banded as soon as they are allowed to run with the flock so that they may always be known. With cockerels of known pedigree mated to hens that have been marked as nearly non-sitters, the breeder has reason to expect considerably diminished broodiness in the offspring.

## NEW YORK MANAGER WILL VISIT PRODUCERS

E. W. Benjamin, manager of the New York plant of the Pacific Egg Producers, will soon visit the Pacific Coast to familiarize himself with methods of egg production, packing and handling. He will visit Washington and Oregon as well as California and meetings have been arranged so that members may have opportunity of meeting him. The Poultry Producers of Central California expect to arrange meetings in the following districts, dates to be announced later: Petaluma, Penngrove and Cotati, Santa Rosa, Bellevue and Sonoma, Sebastopol and Hessel, Novato, Hayward, Santa Cruz, Modesto, Napa, Rio Linda.

## SHIFTING FROM YARD TO YARD

It will not be found necessary to move the poultry from one yard to the other at frequent intervals. Probably once in two or three months will be about right. In the meantime one or two cuttings of green feed can be made from the yard being renovated. It is not claimed that all of the parasites can be destroyed by this method, but apparently a great portion of them are thus disposed of, possibly 90 per cent. This will at least enable the hen to keep in a thrifty condition and will relieve the strain on her vitality. It usually pays to use tobacco dust or some other vermifuge just before switching the hens from the old yard to the new one. Strange to say, the hens will fall off in egg production for a few days, but very shortly will have regained the loss and are all the better off for the change.



THE POMONA
Duplex Plunger Deep Well Pumps

are solving the pumping problems for many users during the period of low water levels. They will lift the water to the surface, and, if desired, deliver it to high elevations above ground and at lower power cost than any other system of pumping water.

# Poultry Queries

(Conducted by Jean A. Koethen)

### Roup in Turkeys

"I read in the last issue of the Cultivator of one wishing to know how to cure turkeys of roup," writes J. E. Annand of Willows. "I have tried many things but the best and quickest is to open the swollen place under the eye and insert a small piece of bluestone about the size of a pea. If this is done before the disease has gone too far one treatment will cure."

### Eats Own Feet

We have a turkey hen that persists in literally eating her own feet. It is not for lack of meat or greens. She has been closely confined for a year but we are now in the country. She does not exercise much nor act as a healthy turkey should.—Subscriber, Dinuba.

Idleness, which includes lack of exercise, would seem to be at the bottom of this hen's queer behavior. Turkeys, even more than chickens, need to be kept occupied. This is one reason why range for at least a part of the day is so essential. You mention but one turkey. If she is alone that also would account for her unhealthy condition. Turkeys are more like children than any bird or animal with which I am acquainted. They must have company, and company of their own kind. A young turkey left alone will always droop and die.

### SOIL SANITATION

Many have had the pleasure of listening to Professor Phillips who spoke at Pomona and Professor Rice who spoke at Los Angeles later. Both of them pointed out very definitely that the poultrymen of California must give special heed to the danger which comes from a lack of sanitation, or as we sometimes say, soil contamination. It seems to us that as a further step toward perfecting a system of renovation for our poultry runs, the double yard system gives the most promise. There are poultry ranches in California where it appeared that poultry farming must be abandoned owing to the losses due to parasites and the general decline in health of the flock. After putting in effect an improved method of sanitation including the double yard system, the profits on several of these poultry ranches proved greater than at first. These instances encourage us to believe that with care the soil may be renovated with success covering a period of years. So far as detail is concerned many different plans will suggest themselves to the reader of this article, the fundamental idea being that the yards should be broken up and exposed to the air and sun by cultivation and that some kind of crop be planted which will tend to exhaust the organic matter found in the yards. If we use a plant which is a strong feeder, such as Sudan grass, for example, during our summer months, so much the better. Probably barley sown to be cut green later on will be the best plant to use in renovating our yards during the winter months.

So important a position does soil sanitation occupy in modern poultry culture that when any epidemic or threatened attack of disease is noted it is a safe proposition first of all to make a special effort to clean up; sweep and scrape the yards, especially near the buildings; disinfect the drinking fountains. If the litter in the house is at all foul replace with new. —Cooperative Poultryman.

### LIVESTOCK

(Quotations furnished by Federal-State Livestock Market News Service, 1014 Pacific Finance Building, based on prices off cars at Los Angeles.)

Cattle: Supplies short, demand broad for fat and feeder stock. Shipments this week from Montana and Denver, buyers now in West Texas. Fat weighty grass steers selling 6.75 to 7.00, f. o. b. ranches, California medium under 1,000 pounds 6.00@6.50. Los Angeles packer bought string fat steers, carrying an end of fat Holsteins, 6.25, f. o. b. ranch, San Joaquin Valley. String alfalfa fed steers sold to local packer, f. o. b. Phoenix, at 6.50. F. o. b. Los Angeles, best fat steers, 7.75@8.00; fat cows, 5.75@6.00. Country sales fat cows, 5.00@5.25; medium and half fat, 4.25@4.50.

Feeding steers supply short, sales, 6.00@6.25 have been made. Arizonas, 5.00@5.25; good northern Arizonas offered at 5.50. Southern California buyers in Utah, Nexada and Montana for thin stock.

Calves 8.00 on best native 150 to 200 pound vealers del. Los Angeles; West Texas, 7.50, heavy vealers, 5.50@7.00.

Hogs: Many swine from Texas, Oklahoma and Nebraska. Advances Eastern markets strengthen values. Grain fed Cal. hogs, 150 to 200 pounds, 11.00@11.25, local plants. Heavier and "soft" getting usual discounts, heavy sows mostly 7.00@8.00.

Sheep and Lambs: Fat lambs active. Several strings California, Arizona, Utah and New Mexico, 10.75@11.25, f. o. b. ranch, 13.00@13.50 (good and choice) lambs, delivered off cars. Active call for feeders, 10.50@11.00; choice Arizona, 11.25. Good demand for breeding ewes, 9.00 a head, f. o. b. Kern County. Practically no aged sheep are being slaughtered at present.—Nelson R. Crow, Livestock Market Reporter.

### WALNUTS

Prices named by the California Walnut Growers Association on last Tuesday are: No. 1, 22½; No. 2, 17½, and fancy budded, 26. Last year's closing price for No. 1 was 27. The market opened at 24½, but only stood at that point for a day, strengthening immediately and moving up to 27.

### BEANS

California Lima Bean Growers Association, September 29:

Weather ideal for threshing, all machines running long hours. Warehouses have shut down cleaners and devote all attention to receiving beans. Scarcity of cars has been adding to difficulties of getting out orders. Steamship space is scarce and practically all booked until the end of October and considerable business has already been passed because first half October steamer space to certain ports is not available. This may easily have some effect in the way of strengthening the market. Rush of harvesting prevents further check on total production. Reports indicate shortening of previous estimate on Baby Limas and shrinkage in anticipated yield on late maturing fields of Limas. Prices on Blackeyes have advanced nearly 50 cents per cwt. during the past week, and will undoubtedly go higher. Market on Baby Limas, Pinks and Kidneys has also stiffened and advanced somewhat, and market on regular Limas is firmer at $6.25 to $6.45 per cwt. for prompt or first half October shipment, and we have today confirmed sales of choice recleaned Limas last week October shipment at $6.25 coast; also Seaside Limas and Baby Limas at $6.65 aboard steamer.

### HAY

Following are prices in the general market to growers f. o. b. Los Angeles in carload lots; handling and commission must be added to obtain retail prices on new hay:

Prices quoted f. o. b. L. A. to producers:

| | |
|---|---|
| Tame Oat | 20.00@22.00 |
| Barley Hay | 16.00@18.00 |
| Rabbit Alfalfa | 24.00@26.00 |
| No. 1 Dairy | 22.00@24.00 |
| Standard Alfalfa | 16.00@18.00 |
| Wheat Straw | 8.00@10.00 |
| Barley Straw | 7.00@ 9.00 |

Prices for alfalfa being received by growers on the ranch vary greatly. As approximate figures we may say that Rabbit Alfalfa is bringing the growers around $22 as a fair average. No. 1 dairy is varying from $15 to $17 with $16 as a mean or average price. Standard alfalfa is not much in evidence. Few offer it; fewer want to buy. If sold it brings from $10 up.

### GRAIN

L. A. Grain Exchange prices:

Barley: October delivery, 100 ton lots, 1.37¼.

Milo: October delivery, 100 ton lots, 1.90.

# San Francisco Markets

San Francisco, October 3, 1922.

### BUTTER

Sales on Dairy Exchange:

Following quotations carry a jobber-to-jobber discount of 10 per cent, plus a seller's handling charge of 2 per cent of net invoice:

| | |

# Citrus Markets

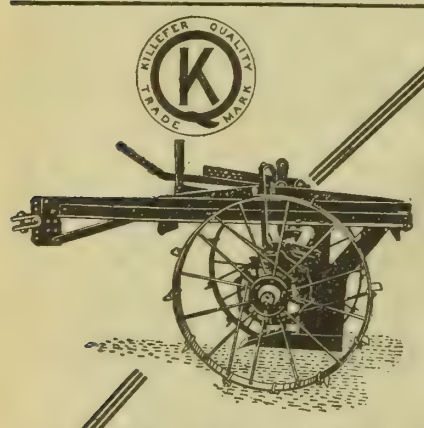
Los Angeles, Oct. 4, 1922.

It is expected that Valencias, the 1800 cars remaining for shipment, will go forward within next six weeks. Early Navels will then soon be ready to go from northern and central districts. Good prices on all good Valencias; inferior stock lower. F. o. b. Cal. quotations 8.00 to 9.00. Florida crop now estimated at 8,400,000 boxes oranges, 6,600,000 grapefruit. Survey of California groves indicates light to fairly good crop showing unusual size and ripening earlier than usual.

Lemon market is strong; little fruit in storage.

### Shipments

Shipment of citrus fruits to date since November 1, 1921. Southern California: Oranges, 22,730 cars; lemons, 9,520; total, 32,250. To same date last season: Oranges, 38,895; lemons, 11,040; total, 49,935. From Central California to date this season: Oranges, 5,099; lemons, 106; total, 5,205. To same date last season: Oranges, 6,603 cars; lemons, 185; total 6,788. From Northern California to date: Oranges, 22,429 cars; lemons, 9,431; total, 380. To same date last season: Oranges, 305; lemons, 5; total, 310.



BUY
Killefer
QUALITY
TOOLS
FOR DEEP TILLAGE

A Tool for Every Purpose

Built to Fit Your Tractor Power

Greater wealth lies waiting for you just below the hard pan and the plow sole in your orchard, vineyard or field. Open up the subsoil, practice deep tillage, you will be surprised how it will improve your crops and increase your profits.

Deep tillage facilitates drainage, conserves your irrigation water and opens the treasure chest of nature's soil chemicals and plant foods and produces healthier trees of longer life, gives greater benefit from fertilizers, prolongs the growing season.

These are the things that can be done with Killefer Subsoilers, Deep Cultivators, Cover Crop Disc Harrows, Killefer Automatic Double Tractor Disc, and Heavy Duty Orchard Cultivators.

Killefer implements are built to fit your tractor power. Write for illustrated booklet of the full line of Killefer Quality deep tillage tools.

## Snappy Notes on Livestock

Another car of average grass steers sold at $7.50 Los Angeles. A car of bulls sold at 4 cents. Carcass prices show strength but some beef offers are made on the 6 cent basis Los Angeles. I find no large lot numbers receiving over 7.50 and average Los Angeles beef price may be said to be 7 cents.

Lambs are slightly weaker in their price advance. No ewe lambs are being marketed in quantity as bulk are being held to build up depleted herds. Few feeder lambs are uncontracted and they are from 11 cents to 9.50.

F. B. Herndon head of the State National Bank of Albuquerque states he will have a shipment to new yards when it opens.

New Mexico drouth in south of state persists and cattlemen are asking drouth rates to California and other points.

Governor Campbell of Arizona has been criticized by some for his lack of effort toward assisting New Mexico cattlemen enter Arizona by changing Arizona quarantine regulations.

A strong demand exists for large heavy feeder steers at 5.50. Cows are offered by the thousands from 3 to 4 cents by weight or 20 to 35 by the head.—A. L. S.

### DEHYDRATORS SAVE BIG CROP

(Continued from Page 354)

blessed as is generally the case with favorable harvesting weather. Rains would have been disastrous. Temperatures have averaged high, prolonging the straw hat season as it were, all to the best interest of the California fruit grower. It was 175 degrees in one of the buildings the writer visited in Redlands this week but this is not intended as a reflection upon the good name of the Redlands district. The building mentioned was an evaporator going at full blast and turning windfall apples into a fine grade of evaporator product.

The late Mr. Dante who wrote something about the "Inferno" probably never visited California. Had he done so he might have turned his valuable interpretation of the hot place to something worth while in the form of an evaporator. The interior of one of these human construced drying machines is a near thing to the infernal region. Also there is a sulphur house that not only feels like hades but smells that way.

All this is necessary because from seven tons of apples there is removed approximately six tons of water, the drying ratio being between 8 and 7 to 1.

It is inspiring after visiting orchards and orchards with tons and tons of fruit—seemingly an unending yield—to pull up at an evaporator plant where dozens of California folks are busy saving and turning into money what would otherwise be a shameful loss. The apples come for drying in trucks, trailers, automobiles and great wagon loads. They are immediately sorted by size and quality, the vinegar and cider stock being removed. The evaporator stock on the Strait Company's evaporator is passed to 12 peeling machines operated by women. A movable belt carries the skins and cores into an evaporator and bin from which they are dropped into a truck and taken to other by-product factories. The peeled apples pass a set of trimmers who pick out the untrimmed spots and wormy apples. Then they are placed on cutter which shapes them into whatever size desired. From this they go to a salt bath and are further selected. Now they are placed on trays, 42 to a truck, or over a ton of the green fruit peeled, cut and selected and moved to the sulphur house. Here a treatment of from 45 to 60 minutes is given and the apples placed in the evaporator which has a capacity of seven trucks or about eight tons.

The up-to-date evaporator is a marvel of engineering ingenuity. With the aid of electricity, thermometers, gas or oil pipes, fans, etc. the moisture is removed from the green fruit with a certainty and a speed that would make it possible to convert California's entire crop into a product that could be kept indefinitely in from eight to ten hours if there were enough of them in operation.

How long will it be before the fruit growers of California or all over the United States will have passed the point of worrying about production and get to the point of providing ample facilities for taking care of the crop as it is produced? With enough warehouses, cold storage, canneries, evaporators, vinegar and cider works and similar agencies to assist in a transportation system all of California's wonderful crops could be saved.

California's produce marketing system leads the world. It is only under the most extreme unyielding conditions that it has not weathered every financial storm.

These great truck loads of wet apples entered the evaporator at a point where the temperature was between 115 and 128 degrees, with a humidity of 45 to 60 per cent. At the exit or drying end the temperature varies from 155 to 175 degrees with a humidity of from 22 to 30. Eight great fans operated by a 20 horsepower motor shot a current of air across the trays of apples that beat any drying work done by the sun on the Mojave desert or hot wind on the plains of Kansas. The gas could be regulated, the air could be regulated, the humidity could be regulated, and the splendid feature of the equipment lies in the fact that the air currents can be reversed so that the fruit on one end of the tray is no dryer than on the other. Samples of the fruit removed were absolutely dry, of a splendid color and apparently of the highest class of dried fruit. The temperatures of course are regulated according to the condition of the apples and kinds of fruit evaporated. Two sets were being operated, 12 each. Eight tons of apples being handled every 12 hours or 16 tons a day. In capacity 15 to 20 tons can be dried in from 8 to 10 hours. The equipment is complete. The plant is conveniently arranged and its initial success would indicate that it would be not only a valuable unit of the equipment in the Redlands district but a life saver to the producer who finds more windfall or dropped fruit than he anticipated.

At the drying end of the evaporator one car is pulled at a time, allowed to cool, scraped into bins and taken by elevators to a sweating room. After the sweating is finished the fruit is boxed in 10, 25 or 50 pounds ready for shipment. All apples dried must conform to federal laws to the effect that no dried product should contain more than 24 per cent moisture content. Properly housed apples put through such an evaporator will keep for many months. Usually they are put into a cool place.

Recently a test was made on evaporating oranges. Splendid selections of the evaporated fruit were sampled and found to contain all the food and sugar value of the fresh orange less the moisture. This is an experiment. So far it bids fair to be a splendid success. In this connection J. H. Strait recently said:

"Whether or not we will find a ready and profitable market for dried sliced oranges is uncertain. The product which we are able to turn out is satisfactory in every respect and the outlook is quite attractive. As president of the Mutual Orange Distributors, I have been very closely in touch with all phases of the industry for several years, and for many seasons as a grower and packer. The truth has been brought home strongly to me, that we must develop a market for our culls and surplus fruit during years of low prices and unfavorable markets. The dried orange can be shipped to foreign markets as a basis for marmalades more cheaply than American manufactured marmalades. It can be held for food markets and will also give the grower an alternative in selling his fruit. We have sent samples to foreign markets, especially the British Empire, and expect favorable returns."

Inquiry has been received from England on prices of carload of dehydrated oranges.

Much credit is due to the pioneers in the fruit industry who made the effort to find means of saving and reducing in weight, the shipment of surplus oranges. The J. H. Strait plant takes all the evaporated and other fruits not boxed for shipment from the deciduous fruit distributors, the members coming from packing houses including The Chino Valley Apple Growers, R. B. Peters, Devore; Isaac Ford, Oak Glenn; Independent Fruit Growers, Yucaipa; Growers Service Co., Yucaipa and J. H. Strait Co. The plant ran 140 tons of apricots that are of wonderful quality. The work is being done on a cooperative basis. The buying and selling is on a cost plus basis. During the operating season these plants in various sections of the state may be seen in operation and it would seem foresightedness upon the part of growers to visit the plants in operation and make plans for installation in other sections in other years.

### PRESERVATION OF GRAPE JUICE

(Continued from Page 379)

tanks, preferably glass lined tanks, in a cool room not above 18 degrees Fahrenheit. The writer has seen loganberry juice and apple juice stored in breweries in the Pacific Northwest for ore than **twelve months without any** sign of deterioration. There are many ideal breweries in the state which, with small expense, could be fitted with crushing and pressing equipment. The writer would strongly urge that grape growers and brewers use this method for holding the surplus grape juice during the present season, should such action become necessary.

The university has issued publication on fruit juices known as "Unfermented Fruit Juices," Circular No. 220. This will be sent free of charge upon application to the College of Agriculture at Berkeley.

### FAMOUS WHITE LEGHORN CHICKENS

We have been hearing much of late of a White Leghorn chicken ranch near Lankershim, Los Angeles County, for it seems to be a mecca for chicken experts from other states and countries. The following are a few of the recent visitors to this ranch, which is known as The California White Leghorn Breeding Farms: F. H. Ching, livestock man of the Dominion of Canada; W. H. Fairley, district representative, Vancouver, B. C.; Alfred H. Lee, Washington, D. C., chief instructor in the federal poultry investigation department; A. G. Phillips of Purdue University, Indiana; W. H. Allen, New Jersey experiment station, New Brunswick, N. J., and Roy E. Jones, extension poultryman, agricultural college, Storrs, Connecticut.

#### Many Prize Winners

More than 18,000 chickens, laying hens, breeders, prize winning stock and pullets live on this farm. There are many houses, each one of which is equipped for the care of 1500 baby chicks. The brooders are heated by distillate. Young chickens may be seen, all hatched in January, that are now laying up to 60 per cent of their number.

At one yard are the great prize winning males that were pronounced the very best of the Mediterranean breeds exhibited at the Los Angeles show. One of the finest sights in California is a view of the snow white chickens in the long houses. These houses are 176 feet long. No expense is spared in getting eggs. Chickens are hatched from eggs that cost more than $2 each. Everything is watched with methodical care; chicks are branded on the feet; individual chickens are studied from every point of view from the time they are hatched up to maturity. There are 3,000 hens to breed from.

Next year a new hatchery will be built having a capacity of 100,000. There are now 4,500 pullets running wild among the trees. The company is constantly buying males from the very best breeders of egg chickens. Twenty-four fine males are there from Hill View, Illinois; 24 from Tom Barron of England, and there are many others just as famous. At this farm two of the finest flocks in the world have been brought together. They are the Emerson flock from Burbank and the Martin-McConnell flock from the Rancho Del Martino at Downey. Mr. McConnell, Mr. Emerson and Judge J. C. Williams of Fullerton will assist in mating these remarkable birds during the next two years.

The California White Leghorn Breeding Farms will enter all shows and all egg laying contests, far and near, that it is possible to get into. This company belongs to the Poultry Producers Association of Southern California, and it believes that all other producers should also belong.

One of the owners said: "Our aim is to furnish anything from hatching eggs to breeding stock. Visitors are welcome any day of the year, Sundays and holidays included."

the Proven Cover Crop.

A&M MELILOTUS INDICA

Bulletin on Melilotus Indica issued by the California State Agriculture Department says: "It has increased the yield of the crops to a greater extent than any of the other legumes tested." The same report shows Melilotus Indica gave an average increase of 64.8 per cent with its nearest rival but 43 per cent.

A. & M. Melilotus Indica seed grown in California is free from weed seeds—99½ per cent pure.

# Two Nationally Known Flocks of Prize-Winning White Leghorns Change Hands

**E. E. Emerson, Dean of American White Leghorn Breeders, also J. V. McConnell and Mrs. E. B. Martin, breeders of the famous Rancho Del Martino Leghorns, have sold their entire flocks, without reservation to**

## The California White Leghorn Breeding Farms

**Lankershim, California**

Most recognized poultry judges of America have pronounced the Emerson and the Rancho Del Martino the best flocks of White Leghorns in the Pacific West. For the past eight years birds from these flocks have WON ALL FIRST PRIZES IN ALL THE BIG POULTRY EVENTS ON THE PACIFIC COAST—INCLUDING PANAMA-PACIFIC EXPOSITION. THEY HAVE ALSO TAKEN ALL FIRSTS AT EVERY OTHER IMPORTANT POULTRY EXHIBITION OF THE INTERMOUNTAIN STATES AND MISSISSIPPI VALLEY.

Dozens of the females in these flocks have trap nest records running from 275 to better than 300 eggs per year. They have been bred strictly to the American Standard of Perfection and will continue to be so bred.

With these two grand, outstanding flocks as a foundation on which to build—and with the close, constant cooperation of both Messrs. Emerson and McConnell in mating their respective strains for the 1923-1924 seasons because of their individual knowledge of these blood lines—we are in position now to supply S. C. White Leghorn breeding stock which for high, proven quality cannot be duplicated in the West nor in any other part of the country.

*In addition to the Emerson and Rancho Del Martino Leghorns, we have in our pens selected birds of blood lines known throughout the world—birds from the flocks of Hanson and Druce, of Corvallis, Oregon; Tancred and Beal of Washington; Ferris, of Michigan; Pennsylvania Poultry Farms, of Pennsylvania; Hillview Farms, of Illinois; and Tom Barron, of England.*

*We have brought together the best high egg producing blood lines of the world because, as large egg shippers ourselves, we know that the commercial poultryman, with high priced feed and low egg prices MUST OFFSET THESE TWO HANDICAPS WITH HENS THAT WILL LAY MORE EGGS THAN THE MAJORITY OF HENS ON THE AVERAGE COMMERCIAL POULTRY FARM.*

**We offer you opportunity to get the best foundation stock, baby chicks and hatching eggs that money, modern equipment and the most careful breeding will produce**

Frankly, we don't believe you can find elsewhere in America the strong blood lines, bred separately, that we have assembled: the offspring and products of which are offered to the commercial poultryman and owner of a farm flock at live and let live prices.

If you want some of these hatching eggs or baby chicks we suggest that you order them now, for our hatching capacity is only 20,000 for 1923.

With those hatcheries whose chief argument for business is CHEAPNESS, we do not try to compete. QUALITY, with us is the first consideration and all the chicks we send out are big, strong, vigorous fellows, properly hatched. The eggs from which we hatch chicks are the same as we sell for hatching, carefully selected for large size, smooth shells, regular shape and good color.

## We Guarantee 100% Fertility in All Hatching Eggs

**By Replacement of All Infertile Eggs**

**The Following Prices Are for Our Heavy Commercial Matings:**

### HATCHING EGGS

From Nov. 15 to March 15—15 for $2.00
In 100 lots, 12c each—In 500 lots, 11c each
In 1000 lots, 10c each

### BABY CHICKS

January, February, March
In lots of 100, 25c each—In lots of 500, 24c each
In lots of 1000 or over, 23c each for delivery

**We Always Have Three, Four, Five and Six Months Old Pullets from Pedigreed Trapnested Stock**

**You are cordially invited to come and see the stock from which your hatching eggs or baby chicks will be produced—also the fine pullets we are now offering. Or you may order from this ad. by mailing remittance for 10% of your purchase. Our catalog will be ready for mailing soon—don't fail to register your name NOW so you will be sure to receive your copy.**

**Exhibition Stock Always a Matter of Correspondence**

# What the Electrical Industry Has Done for California

By F. E. Boyd

IN California there has been developed by the power companies the greatest interconnected system of power transmission lines in the world, extending from Eugene, Oregon, on the north to the Mexican border on the south, and also eastward to Tonopah, Nevada, and Yuma, Arizona. These interconnections not only produce large economies through the building up of system load factors and the substitution of water for steam in the generation of power, the benefits of which accrue to the public, but throughout the vast territory covered they make possible better service and the meeeting of a shortage of power on any one system out of a surplus that may exist in some other system.

The largest concentrated block of electric power ever available for public use is made possible by this interconnection, which ties together over a million horsepower of hydro-electric generating plants with a total annual output of energy delivered of close to four billion kilowatt hours.

As a matter of fact we have here in California in actual operation the super-power system which the Atlantic Seaboard is today just planning as one of its major projects for the next decade.

In California, under private ownership, there has been developed a universal use of electricity which stands without parallel. In 1920, 83 per cent of the dwelling houses of this state were wired, as against 35 per cent for the United States. The whole state has been girdled with transmission and distribution lines so that the inhabitants of the rural and sparsely settled districts have at their command electric service on an equal basis with those of the large cities.

Not only is the service rendered generally at uniform rates as between city and country, but these rates are among the lowest in the world. The average rate per kilowatt hour for power generated, received by the California companies for the year of 1921, was only 1.42 cents compared with 2.17 cents for the United States.

As a result of these conditions the

OUR ADVERTISING RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest, bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If among the more than 40,000 Cultivator's weekly circulation any fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

## EDITORIALETTES

California is the richest of all the states in the Union in hydro-electric possibilities. While there is no great massing of power as there is at Niagara there are great numbers of smaller opportunities which may be brought together and an aggregate of almost boundless resources be developed. Niagara boasts a total potential power equivalent to ten or possibly a dozen millions of horses. But all the world owns Niagara and 100 per cent usage of the waters of the Great Lakes for the production of power will never be permitted.

* * *

One of the best features of development in California is that the use of water for the development of power in no way impairs it for irrigation. In fact it may mean storage and greater conservation. The photograph on the cover of this issue shows one of the plants of the Pacific Gas and Electric Company which is known as the Halsey power house. Alongside the illustration is an outline of some of the other installations of that company. This company's installations are largely in the upper waters of the Sacramento. Farther south are installations by the Great Western, San Joaquin Light and Power and the Southern California Edison people. The description of a very few of these installations will be given in the next issue of the Cultivator.

* * *

Pomona College has secured for the coming year the services of Dr. A. B. Stout. Dr. Stout was for many years connected with the New York Botanical Garden. He will bring to California the latest and best of horticultural work from the East. His initial work will consist of four lectures on successive Thursday nights, commencing October 19. These will be under the general title of Modern Problems in Crop Production and Plant Breeding.

* * *

The state department of agriculture has issued Special Publication No. 127, "A Milk Goat for Every Back Yard." It is the work of Dr. J. G. Jackley. Dr. Jackley is assistant chief of the division of animal industry and has gathered together a fund of valuable information in regard to the milk goat. He not only gives practical suggestions as to general handling and care of the animal but the report has a condensed summary of proposed rules governing the sale of goat milk. The milk goat is proving more and more its fitness for California conditions and is materially aiding in increasing California's wealth.

* * *

The Los Angeles County Fair at Pomona is scheduled for opening next Tuesday. It plans for closing some time before midnight of Saturday. The management is proud of the fact that as the representative of the greatest producing county of the United States it is able to offer attractions worthy the greatness of the county. The "Biggest and Best" on many of its exhibits calls for bigness in its housing arrangements. It being the first fair new barns and sheds have been erected in the livestock section. Available tents were all too small, and one worthy of the occasion has been manufactured. It is said it will be the largest tent ever erected in the state of California. The arrangement of grounds and exhibits will permit examination of the various features with least travel. It is the first real agricultural fair to be staged in Pomona and the management assures us it will not be the last.

* * *

Folks of this U. S. A. surely do eat a lot of manufactured "butter." Manufacturers and dealers special license taxes during the past year brought in a total revenue of $1,159,940. In addition there is a one-fourth cent tax on uncolored oleomargarine and ten cent tax on colored oleomargarine which also brings in another half million dollars.

## HALF A CROP

Corn growers of the United States who start out every spring to grow 100 bushels throw over into the wagon box at harvest time only 64 bushels. This statement is made because of figures compiled by the United States department of agriculture over a 13 year period. The difference between the potential crop and the quantity harvested is due to weather conditions, defective seed, plant diseases, and devastations by insect and animal pests. For every bushel of corn harvested somewhat over one-half a bushel fails to reach harvest.

Were it not for the elements that tend to reduce the size of the crop the average crop for the 13 year period would have been about 4,374,000,000 bushels instead of the 2,805,000,000 bushels harvested, provided the same acreage were planted. The department points out, however, that if these elements did not exist and the corn grower was certain of realizing 100 per cent results, the corn acreage probably would be greatly reduced, so that the final outturn might not be a larger crop than that actually harvested. It would mean simply that the farmer could get from about two acres the crop that he now harvests from about three acres.

## UNCONSTITUTIONAL

The California fruit and vegetable standardization act of 1921 has been declared unconstitutional by the state supreme court. The ground of the decision is that the act grants to the state department of agriculture legislative powers. The court claims the "legislative power" was used by the department of agriculture in the ruling in which it defined oranges unfit for shipment as those showing drying in 20 per cent or more of exposed pulp as shown on a transverse section through the center of the fruit and having crystals and crystaline deposits on two or more segments of the orange.

The matter was taken up to the supreme court under an act begun by an orange grower or shipper after he had been arrested for shipping three boxes of frozen oranges not inspected and passed by inspectors of the state department of agriculture. The court granted him the writ of habeas corpus and discharged him from custody.

In any case the accomplishments of the law in saving citrus markets the few weeks following the 19th day of last January are well worth all it has cost. The legislature convenes in January for the 1923 session and for the sake of the citrus industry it is to be hoped the legislative committee will secure the enactment of a law which will hold water and be effective.

## GRAIN GAMBLING

The Capper-Tincher bill, depriving grain speculators of the use of mails and otherwise controlling gambling in grain futures, has been signed by the president and is now a law. The law gives the government the same weapon to clean out the grain gamblers which was used to put the Louisiana lottery out of business. The Louisian lottery was hardly a start in gambling compared with the operations of the grain and produce exchange. Or again, as one editor expressed it:

"Monte Carlo is a mumble peg gambling resort and the Louisiana lottery a penny ante game, compared to future trading on grain exchanges. Only chumps, with more money than brains, ever went against Monte Carlo and the Louisiana lottery, while the country is strewn with innocent, helpless and unwilling victims of the grain gamblers."

"The new law takes the place of the regulatory provisions of the Futures Trading Act of August 24, 1921, which was declared unconstitutional by the supreme court of the United States last May. In substance the new law is the same as the old, but the new law is based on the power of congress to regulate interstate commerce, the former, on the taxing power of congress. The new law does not become operative until November 1. As all the exchanges were fully acquainted with the requirements of the former law there should be no difficulty or delay in complying with the new one. The exchanges affected are those at Chicago, Minneapolis, Duluth, Kansas City, St. Louis, Toledo, Milwaukee, San Francisco, Los Angeles, and Baltimore.

This law does not interfere with hedging transactions on the boards of trade. Neither does it interfere with ordinary speculation in the buying or selling of contracts for future delivery. If, however, there should be evidence of undue manipulation or attempts to corner the market or of the dissemination of false or misleading information about crop or market conditions by members of the exchanges, such conduct would be inquired into and promptly dealt with as required by the law. In addition it prohibits the exchanges from discriminating against cooperative associations of grain producers who may desire membership in order to obtain the use of the facilities of the grain exchanges. The secretary of agriculture also is given the requisite authority to examine the books and records of the members of the exchanges and to require such reports as may be necessary to carry out its provisions.

## THE BUDGET

The expenditures of the federal government are now being made on the basis of "The Budget." The business of conducting this government is said to be one of the very largest business ventures on the face of the earth. Some have remarked that it has been not only the biggest but the worst managed of any on earth. Some of the mistakes of the past are made more outstanding by the successful work of the budget as now handled. In reviewing, regarding the working of the new system the Girard Letter says:

"But something far more important than is obvious to casual readers of Washington news has taken place, which completely changes nearly every business procedure of the federal government.

"The new budget system lay bare so many leaks and has already stopped up so many holes that a study of its operation will be found highly interesting.

"The budget bureau is nonpartisan and nonpolitical. While it has been set in motion since President Harding was inaugurated, the budget came as a sequel to a demand from both political parties that something be done to dam up at least some of the subterranean drains that led out of the national treasury.

" 'There is no reason why,' exclaimed General Charles G. Dawes, who was the first director of the budget, 'because the government of the United States does the largest business in the world it should be the worst conducted.' "

Here is an example of the old way and the new way of doing Uncle Sam's business:

The coast and geodetic survey, which is a part of the department of commerce, needed two ships to carry on its work. The United States navy department at that moment had 49 mine sweepers which it didn't need and which were going out of commission.

Under the old regime the geodetic survey would have bought two new ships for a cost of not less than $1,000,000 because the navy could not or would not transfer to the survey's use two perfectly superfluous mine sweepers.

What did the budget director do? He told the navy chief that the geodetic survey and the navy are both parts of the United States and that the property of the one belonged to the other if it could be used by the one and was not needed by the other.

The mine sweepers were transferred and Uncle Sam saved $1,000,000.

Then there was a case of brooms. The navy needed 18,000 brooms at a time when the army with its war surplus supplies on hand, was trying to sell 350,000 brooms.

In one year $112,000,000 worth of supplies was shifted from departments where they were not used to others that required them.

In this one item alone the government was saved $32,000,000.

Vol. LIX, No. 16 Los Angeles, October 14, 1922 One Dollar Yearly

# Fruit By-Products

## From Address by W. V. Cruess, Before Placer County Fruit Growers at Auburn

THE principal fruits I have been asked to consider are peaches, pears, plums and strawberries. I have been unable to obtain an accurate estimate of the amounts of each of these fruits that would be available for by-product purposes; but an estimate of a total of 6000 tons of cull fruit was given me by one of your growers. At a value of $20 per ton for by-product purposes, this fruit would have a total value of $120,000. It should be possible to obtain at least this price per ton for the grower. The problem is of enough importance to warrant the fruit growers of this district spending some time and money investigating possible outlets for this fruit.

I regret that I can not come to you with definite plans and specifications for the building of a plant and with working directions for processes of manufacture of products and by-products which I could guarantee would return to the growers a good price for their cull fruit. It is possible, however, to suggest methods of utilizing part of this fruit and we can indicate a possibly profitable line of investigation which may be followed in developing methods for the utilization of the remainder.

### Dehydration

I imagine that no one is particularly interested in sun dried clingstone peaches, plums and inferior dried pears. No one cares to buy sun dried fruit unless it is prepared from the best fruit of the orchard and from varieties suitable to the purpose. Sun dried pears made from culls are usually a drug on the market. All of these fruits can, by suitable means, be made into attractive dried products by dehydration. I do not wish to be misunderstood and have you think that any quality of fruit can be made into a salable product by dehydration. Such is not the case; it is possible, however, to use small fruit successfully for dehydration, provided it is sound and otherwise of good quality. No one would expect to use sun burned, wormy and soured fruit, or that which is otherwise so badly damaged as to be unfit for food.

### Principles of Dehydration

I realize that this is a convention at which only thoroughly practical ideas should be presented and that nothing should be given that is not directly applicable to practice. Knowing this desire on the part of your program committee, I shall discuss the fundamentals of dehydration only as they can be applied in practice and shall not trouble you with a detailed account of the mathematics of dehydration.

The principal purpose of dehydration is to remove sufficient moisture from the product to be dried so that it will not undergo decomposition. This object must be accomplished with a minimum expenditure of fuel (or energy), labor and time. In order to build and operate a dehydrator with the maximum efficiency, it is necessary that certain fundamental, yet extremely simple, facts be thoroughly understood and applied.

### Necessity of Heat

The first requisite is heat. Without heat evaporation of moisture from fruit can not take place; even in sun drying the same amount of heat is required to evaporate a pound of water as is required in dehydration; the only difference being in the source of the heat used. There is no mysterious means of removing moisture from fruit without the application of heat from some source or another. In round numbers, it requires about 1000 British Thermal Units to evaporate a pound of water. A British Thermal Unit (or B. T. U.) is the amount of heat required to raise the temperature of one pound of water one degree Fahrenheit. A gallon of crude oil will yield about 135,000 B. T. U., or theoretically should furnish heat sufficient to evaporate 135 pounds of water.

(Continued on Page 394)

# Stockyards Activities

## By A. L. Spellmeyer

THE growing meat demand and the shortage in beef, hogs and lambs in the West, has disturbed the economic balance that existed in the Middle West markets on lambs, already, and it will bring Los Angeles into competition this winter on both beef and swine in markets that formerly supplied Omaha, Kansas City, Ft. Worth and Portland.

The position in meat circles is one of uncertainty, as to the exact course of events, and men are preparing to play whatever game may come forth from the new conditions, and that applies to the veterans in killing and buying circles as well as many cattle owners and speculators. Only a few large cattlemen are resting in the assurance that the Los Angeles union stockyards will not succeed, and for each one that so believes a hundred are preparing to meet a new method of marketing livestock for this Southwest.

Six hundred men are working out at the new stockyards in the Vernon-Maywood district. A bus line will start shortly from Twenty-sixth and Santa Fe in Vernon to the yards. Some ten acres of corrals are finished with cement floors and runways, and the unloading chutes reaching a long train length are already covered. Stock could be handled today if it were a necessity. This is written September 27 and by the time it reaches print the building yards will be close to a finish as far as corrals are concerned.

These are the only yards that I know of where stock can be loaded and handled under cover from winter rains or summer heat. Complete dipping vats, branding chutes and facilities are being erected. The Exchange building is a large structure of cement and brick situated about 200 yards from the highway line. A 100 foot boulevard curves from the main highway. At one side is a great reservoir. The exchange building has two great wings. On one side at the front will be the bank and on the other above the hotel. The commission offices will be on both first and second floors. It looks at first glance impossible to complete the yards for operation by November 1, but closer inspection shows the heavy work is already accomplished. Money and experience can accomplish great things.

There has been a great gathering of commission men and speculators to this vicinity, and there is little doubt the stockyards management has used every precaution towards protecting producers from crook manipulators. A veteran of the Chicago, Kansas City and other yards states that the list of commission men who had applied for space in the yards is the best he has ever seen operating at any yards in the United States and that the list has been carefully weeded to insure the very best service.

Before the yards swing into business I might make a pertinent suggestion that the commission men of the new yards can well disarm criticism by reverting at the start to prewar commission rates. The American National Livestock Association is now suing for this adjustment in the Middle West markets. However that is for the new exchange to consider when it is formed.

New men entering this market to buy cattle, own cattle or feed cattle, have in some instances the benefit of a considerable credit from Chicago, or Denver or Kansas City, but they are handicapped by a lack of knowledge of the country and its conditions. Some few of them figure the packers and commission men and money backing can force a new condition rather than persuade it. This to us here is a new attitude, and personally I believe the few who hold it are due for education. Middle marketers of meat are today in a position the saloon men formerly held as regards liquor trade as the saloon men made this nation dry through abuse. If the commission men and packers in this new market effort apply a producer protection it will be well; if they don't the inevitable will happen and California producers will force cooperative marketing that will make one complete operation from producer to consumer. I do not believe the present objectors to union stockyards can seriously embarrass or prevent a successful livestock movement here. They are opposing the development necessary to one of the great cities of the world and the very trade force will make objections irrelevant and futile, as the stockyards effort is the first attempt in the Southwest to encourage and stimulate small man production in livestock. So far no operation could be more frank and open that McNaughton's management and statements as to these union stockyards, but equally if the operation later is not satisfactory to livestock producers, a drastic producer to consumer plan will be born in California meat as it has been in California fruit.

One man's guess is as good as another's, for no one knows the exact result from the chemical mixture of the new plan and the Southwestern conditions. Bixby thinks results will be bad, others that results will be good for producers and for small men.

The inconstancy of the farmer class must be figured in all stockyards possibilities. There are today 50 new men buying and handling cattle. The applied power of the man who handles 10,000 cattle is as great a market force as that of the man who raises 10,000 cattle. Considerable number of the objectors to stockyards are no more producers than the packer feeder is a producer, for they are buyers of steers and grass feeders. What they do does not add a single breeding cow or another calf to the cattle supply, except indirectly. It's the more or less calves in this nation that make cattle plenty or cattle shortage.

Already we can see great forces re moving economically towards a change, as the new million coming to California and others following are demanding to be fed.

Los Angeles, using 2000 to 3000 lambs daily, is absorbing extra hundreds of thousands of lambs until Kansas City is short of accustomed supply. Actually in the near future Los Angeles is closer to New York than Kansas City as with proper ships and equipment meat can be delivered from Los Angeles to New York for less than meat can be delivered from California to Kansas City, by railroad. It is my prediction that with the completion of the Colorado project the coming 20 years will see Los Angeles supply through its great adjacent feed districts the meat for the Atlantic as well as the Pacific Coast.

Everybody condemns the speculator but he is the man who is now forcing better producer prices. Today speculators are combing the country for large 1000 pound feeder steers and beef steers of good quality, and raising slowly but surely the low western cattle prices. Sheep are high, when lambs bring $7 to $9 each. Hogs are scarce here and beef is coming into its own soon.

# Agricultural News Notes of the Pacific Coast

## Northern California

Heavy shipments of grapes are being made from Livermore.

California Industries Exposition opened at San Francisco, October 7.

A $10,000 egg packing plant is being built at Hayward, Alameda County.

The Tehama County farm bureau plans a membership campaign in November.

Fires in reserve west of Orland, Glenn County, burned over nearly 50,000 acres.

Pope Valley's (Napa County) third annual fair, just closed, was voted a huge success.

A carload of raisins was shipped last week from Marysville, Sutter County, to Bergen, Norway.

The new tariff imposes a duty of 4¾ cents on unshelled almonds, 14 on shelled, 14 on almond paste.

Hop baling is practically completed in Sonoma County. Much of the crop has been purchased by English firms.

The Orland, Glenn County, chamber of commerce attended opening of the Pit River plant of the Pacific Gas and Electric Co.

The Yuba County farm bureau has asked the state railroad commission to order extension of water system in the Erle district.

The home department, Glenn County farm bureau, will meet during October at Willows, 14; Westside, 19; Grapevine, 20; Lake, 25.

Lake County fair registered attendance of 5,000 on Saturday, September 30. The management reports complete financial success.

The Glenn County farm bureau will hold October meetings as follows: Willows, 14; Capay, 18; Plaza, 20; Grapevine, 25; Glenn, 27.

Forest fire fighters in Sonoma County have been repeatedly attacked by yellow jacket wasps and some were severely poisoned.

Northern California Counties have called on orphanages and similar institutions to aid in the great fruit harvest, the labor shortage being acute.

Colusa County raisin dryers did some quick work getting their drying trays under cover during last week's rainfall. Practically no damage reported.

The California Almond Growers Exchange now places its estimate of the state's output of almonds at 7500 tons against earlier estimates of 9,000 tons. The exchange is already practically sold out on all varieties.

The egg laying contest at the Glenn County fair attracted much attention. O. Rosenblatt, H. R. Wynn and J. P. Hitz tied with 15 each from their pens. Mr. Hitz' pen was of White Wyandottes; the others were Leghorns.

The California Cherry Growers Association has had a successful marketing year. Price for canning peaches, 9 1/5 cents, established early in season was maintained. 3500 tons of canning cherries was the state's output this year.

The railroad commission has established graduated schedule of flat rates for Baldwin water system in Los Angeles County. The company was ordered to reimburse consumers in monthly credits of 10 per cent a charge of $9 for service connections.

## Central California

Watsonville held a harvest festival, October 5.

Many ventilated box cars are being used for grape shipments.

The Turlock irrigation district has admitted the Delhi land settlement.

The war conditions at Smyrna have resulted in boosting prices on California figs.

Modesto is pulling for next year's meeting of the Pacific Slope Dairy Exhibition.

A cockerel auction will be held at Tulare, November 22 under auspices of the farm bureau.

Hilmar, Fresno County, has just shipped the last 4,000 bags of Blackeye beans of the 1921 crop.

A series of demonstrations of smut control in grains is being arranged by County Agent Jungerman of Stanislaus.

The Porterville district will ship about 40 cars of pomegrantes. Most of the crop is of the Wonderful variety.

It is estimated that the Chevalier barley crop of the Salinas Valley, Monterey County, will total 180,000 sacks.

Oakdale, Stanislaus County, has a cannery that will handle nothing but green beans, from September 20 to December.

The three fig canneries operated by the California Peach and Fig Growers have handled 1000 tons of Calimyrnas and 150 tons of Kadotas.

The California Olive Growers hopes during the winter to secure 75 per cent of the olive acreage in the state so that it may begin operations next year.

The allotments of the fourth unit of the Delhi Colony will be on sale November 1-30. Eighty-seven farms and nine two acre farm laborer allotments will be sold.

The city attorney of Fresno has been instructed to draft an ordinance requiring property owners to clear their lands of the puncture weed, Tribulus terrestis.

The Libby cannery at Selma has put up over 4,000,000 cans of spinach. 100 tons of table grapes will be canned. Large packs of apricots and peaches have also been made.

Oakdale irrigation district of Stanislaus County has 19,002 acres under irrigation. 42,000 acres not irrigated are under cultivation. The grape acreage was doubled this year.

Larger return for citrus crop of 1921-22 than for crop of preceding year was reported by Secretary Sprott of the Tulare County Fruit Exchange at the annual meeting at Porterville.

In the Terra Bella district of Tulare County are several small vineyards of Thompson Seedless, planted in 1920, that this year yielded one ton of dried raisins to the acre, a monetary return of $130 "per."

Application has been filed for the formation of the Kings River water storage district, a $30,000,000 project to irrigate more than 1,000,000 acres. A dam will be built at Pine Flat to store 600,000 acre feet of water and a power plant of 90,000 kilowatts capacity. Fifteen irrigation districts are included.

## Southern California

Los Angeles County fair at Pomona, October 17-22.

Dried beans secure in the new tariff a rate of 1¾ cents per pound.

Yucaipa has decided not to hold the apple show this fall as planned.

The big new walnut house at Saticoy, Ventura County, has opened for the season.

Santa Ana, Fullerton, Anaheim and Orange are joining in an outfall sewer to the ocean.

Honey has been given a tariff of 3 cents a pound; walnuts, unshelled, 4 cents; shelled, 12.

Prices named by the California Walnut Growers Association are 10 per cent less than last year's.

Apricot institute, Ventura Union High School, October 27. Control of brown rot, black scale and frost will be discussed.

Imperial Valley has formed a "Boys Purebred Calf Club," and an El Centro bank has offered to advance the money to buy calves.

Members of the Orange County farm bureau held their third annual excursion to the citrus experiment station at Riverside last week.

Calipatria growers, Imperial County, have signed up for planting five and ten acre plots of Carolina strawberries to a total of 250 acres.

San Jacinto's new milk skimming plant is now handling 225 cans of milk daily and sending 30 cans of cream to the Burr Creamery at Los Angeles.

A two story reinforced concrete warehouse is being built at Los Angeles by the Poultry Producers of Southern California. It is on the corner of Mill and Industrial.

Olives in brine, green or ripe, are given protective tariff of 20 cents per gallon; pitted or stuffed, 30 cents; dried ripe, 4 cents pound; olive oil in less than 40 pound containers, 7½ cents.

Ventura County is shipping beans by water to the Atlantic Coast. The motor vessel "Vaquero" left Hueneme, September 18, with 5600 bags of beans. They were transferred at Port Los Angeles to a larger vessel.

The Carolina strawberry in the Imperial Valley is said to have yielded 7,000 baskets of berries to the acre the first season, only 14 weeks after being planted. Japanese are known to have netted $1,500 an acre.

Revision of the state motor vehicle act will be considered at the October 18 meeting of the Southern California Supervisors Association at Los Angeles. Supervisors now have power to limit loads but not speed of trucks.

Estimates of next season's lettuce planting in Imperial range from 14,000 to 32,000 acres according to the Brawley News. Considerable effort is being made to improve on the "hit or miss" marketing methods of last year.

The board appointed by the governor to locate site and prepare plans for a school or college of agriculture in Southern California consists of H. A. Jastro, Senator S. C. Evans, Mark Grimes, G. H. Hecke and Dean T. F. Hunt.

## The Coast and General

Canada is seeking an outlet for her potato crop in Cuba, Mexico and West Indies.

Fruit growers of White Salmon Valley, Washington, are handling and shipping their own fruit.

The lettuce crop of the United States is estimated to be 25 per cent more than that of last year.

Secretary of Agriculture Wallace has asked an appropriation of $500,000 to extend market service in the western states.

Shipments of fruit by truck and by small boats from southwestern Michigan are becoming increasingly important each year.

The new tariff bill after nearly two years of amending has finally become a law. Over 3,000 changes were made in the original bill.

Federal statistics show that potato shipments to date exceed those of 1920 by 17,000 and 1921 by 10,000 cars, resulting in lower prices.

The beet sugar output of Europe this year will be 225,000 tons greater than last year, exclusive of Russia. This will be little more than enough for home consumption.

The Arizona Pima Cotton Growers is continuing membership drive in the Yuma Valley. Secretary Helworth reports more than 75 per cent of the Pima acreage already enrolled.

The Hood River, Oregon, apple harvest began September 20. Lack of frosts has not colored Jonathans sufficiently, but the hot weather hastened ripening of Winter Bananas.

War time sugar ration cards are to be reintroduced to the Hungarians. Insufficient sugar crops have compelled the government to maintain control over the prices, import, distribution and consumption.

The Kansas state railway commission has filed complaint with the interstate commerce commission against railroad rates on grain. Nebraska and a number of other states will join in the complaint.

Next to the biggest export industry of war born Latvia is the egg business. Over 70,000,000 eggs having been sent chiefly to England last year, with an estimated shipment of between 120,000,000 and 130,000,000 this year.

Australia within the last few weeks has sold over 16,000,000 pounds of frozen beef and 400,000 pounds of frozen mutton to Germany. France is inquiring in Australia for frozen lamb. Australia is also giving increasing attention to the Japanese markets.

The Russian cooperative society "Khleboproduct" has purchaed in Argentina 5,000,000 pounds of meat, for which purpose it has been allotted 500,000 gold rubles by the government. The balance of the cost of the meat will be covered by exports of lumber and wine to Argentina.

The cooperative movement has reached stages in Italy equaled in no other country of Europe, over 8,000 societies having been formed for the purpose of reducing the cost of producing and the cost of living. With a membership of 2,000,000 these societies have an annual turnover of 1,500,000,000 lire. Many maintain their own savings banks, with deposits running up into the millions.

# Freight Rates on Farm Products

IN an address before a mass meeting of farmers and business men at the fair grounds, Davenport, Iowa, Wednesday, October 4, Secretary of Agriculture Wallace discussed the agricultural situation and the agricultural legislation enacted by congress. He referred particularly to freight rates on agricultural products, and said in part:

"One of the heavy burdens which the farmer has been forced to carry at a time when he was least able to carry it has been the large increase in freight rates. In 1920 freight rates on many of the more important farm crops were almost double what they were before the war. These increased rates not only imposed a grievous financial burden but in many cases narrowed the market for crops which were not worth enough to carry the freight rate to distant markets. At the same time the increased rates on the things the farmer had to buy added to his cost of living and the cost of production by just that much. Had prices of farm crops remained at the 1919 and early 1920 levels the higher freight rates could have been paid without inconvenience. A freight rate of 25 cents a bushel when corn is selling for $1.75 a bushel is not a serious matter, but a 25 cent rate on 50 cent corn is ruination. During 1921 the influence of the administration was exerted in every proper way to bring about a reduction in freight rates on farm crops, and a number of important reductions were secured. Rates are still altogether too high, however, with relation to the selling value of crops, and further substantial reductions must come in the near future.

"This railroad question is exceedingly complex and difficult. When the federal government took over the roads it was on the agreement that in addition to proper maintenance they should be assured of earnings equal to the average of the three years, June 30, 1914, to June 30, 1917. Costs of operation were increasing steadily and the government advanced both passenger and freight rates. But materials, and especially wages, continued to advance, the latter with government assent and even encouragement. Inquitous working agreements and shop rules which greatly reduced labor output were accepted. The result was that railroad costs of operation increased far more than railroad receipts. During this period practically everything shipped was selling at a price high enough to have carried a correspondingly high freight rate. Good business administration would have provided for railroad income during those prosperous times large enough to meet the government contract and would thus have saved the hundreds of millions which the government afterward had to pay. Also it should have made it possible for a prompt reduction in rates when the prices of farm crops made it necessary.

"The urgent demand by farmers for large reductions in freight rates has led some people to think that if the farmers could have their way they would put rates so low that the roads could not possibly operate. Nothing could be further from the truth. The farmer is almost wholly dependent on the railroad for the movement of his surplus crops and livestock. Much agricultural freight is perishable and must have expedited movement. The farmer, therefore, has a direct interest in efficient railroad operation and knows that the roads must be permitted to charge enough to cover all proper costs of operation and enough in addition to give a fair return upon the money invested and thus keep capital in the business. Neither does the farmer want government operation of the railroads. He had enough of that in his three years' experience to satisfy him for all time. He will never forget the losses, both direct and indirect, which he suffered because he could not ship when his stuff was ready for market, and because of bad service.

"Nevertheless, freight rates on farm crops and livestock must come down. With present prices for his crops and with probable prices for the next year or so the farmer simply cannot afford to pay the present rates. They are out of all proportion to the pay he gets for what he grows.

"The distortion between the freight revenue received by the railroads and the prices for the principal farm crops in the year 1921 can be illustrated in this way: In 1913 the average amount the railroads received for hauling a ton of freight one mile would buy 1.4 bushels of corn in Iowa; in 1921 the revenue received by the railroads for hauling a ton of freight one mile would buy 3.1 bushels of corn in Iowa. In 1913 this revenue per ton mile would buy 1 bushel of wheat in North Dakota; in 1921 1.1 bushel. In 1913 6.1 pounds of cotton in Texas; in 1921 10.5 pounds. In 1913 10 pounds of hogs in Nebraska; in 1921 18 pounds. In 1913 1 bushel of potatoes in New York; in 1921 1.5 bushels. In 1913 14 pounds of sheep in Wyoming; in 1921 22 pounds. In 1913 2.1 bushels of oats in Illinois; in 1921 3.9 bushels. In 1913 3.1 pounds of butter in Missouri; in 1921 4 pounds.

"It would not be fair to assume from what I have just said that the increased purchasing power of the freight revenue represented profit to the railroad. On the contrary, railroad cost of operation increased even more rapidly than railroad receipts. Apparently the largest item in the increased cost of railroad operation was composed of the advanced wages given railroad employes. It is interesting to compare the purchasing power of the average yearly earnings of railroad employes in the year 1921, expressed in terms of farm products. Taking the average yearly earnings of railroad employes, we find that in 1913 the yearly wage would buy 1492 bushels of corn in Iowa, and in 1921 4112 bushels. It would buy 1028 bushels of wheat in North Dakota in 1913; in 1921, 1466 bushels. In 1913 it would buy 6449 pounds of cotton in Texas; and in 1921, 13,934 pounds. It would buy in 1913, 102 hundredweight of hogs in Nebraska; and in 1921, 237 hundredweight. It would buy 148 hundredweight of sheep in Wyoming in 1913; and in 1921, 296 hundredweight. In 1913 it would buy 1087 bushels of potatoes in New York; in 1921, 1916 bushels. In 1913, 2174 bushels of oats in Illinois; in 1921, 5109 bushels. In 1913 3309 pounds of butter in Missouri; in 1921 5285 pounds.

"A hopeful sign which points toward the possibility of reductions in railroad rates is the gradual reduction in the part wages contribute to the total operating cost. Apparently the railroads are making steady progress in the reduction of these costs, and should therefore be able soon to make substantial reductions in freight rates on farm products.

"In considering the matter of freight rates of agricultural products there are two things which should always be kept in mind. First, that the cost of transportation is essentially a part of the cost of production, so far as agriculture is concerned, and any increase in transportation costs must come out of the price the farmer receives. In this the farmer is at a disadvantage with the manufacturer, the jobber or the retailer, all of whom as a rule are able to add increased transportation costs to the price they get from the buyer and who are therefore interested not so much in the freight charge proper, but in being assured that the freight charge, what-

# Date Growing in Salt River Valley

By M. E. Bemis

Date Palm Tree On the Farm of H. G. Mosse

This tree has yielded dates which have sold for $100 or more annually for the past several years. The platform shown was erected to facilitate picking.

Those fortunate owners of bearing date palms in southern Arizona have realized splendid profits from their trees. Apparently there is a great future for the growing of dates provided sufficient numbers of offshoots are obtainable for planting in commercial quantities. Perhaps more important even than this is that those planted should live.

Several years ago the state experiment station checked up on offshoots which had been distributed through the station and found, as I recall, that only about seven per cent had survived. More careful attention on the part of studious growers has resulted in a higher percentage of offshoots surviving but, even at the best, there is still much to be desired in the way of successful propagation.

In order to determine the best methods of planting offshoots, there is being tried out at the state experiment farm at Mesa a number of experiments which will, it is believed, show quite definitely the methods that should be followed.

Several hundred offshoots have been planted in the test gardens. Some of these have been planted in trenches underdrained, with a good supply of crushed rock; others have been planted in river sand; some in a rich soil; and still others have been planted in pots also under varying types of soil and drainage conditions. Some pots are set in the ground, others on top. These have been planted in the open.

The same conditions as to soil and drainage, pot planting, etc., have been duplicated in a lath house around which are growing vines to prevent the effect of drying winds. By the end of the season this experiment will be far enough along so that it is believed that growers fortunate enough to have, or to be able to obtain, offshoots may plant them with a better assurance of success than formerly.

Superintendent C. J. Woods has one row which he is trying out under a system of his own. These are set directly in the ground and protected with burlap. At the present time these show up rather more favorably than the average although it is by no means definitely certain that this will be the better method of the several being tried out.

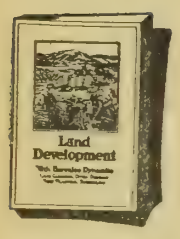
# Your Sorting Table Will Tell You

Look at your sorting table. It will tell you whether Hercules Farm Dynamite has helped your crop or not.

Not only by planting your orchards with

**HERCULES FARM DYNAMITE**

but also by blasting between the rows you will get heavier, juicier fruit, and more of it.



*Send for this book— It is free.*

Read up on dynamite for the farm in the Hercules Powder Co.'s 75-page book, "Land Development". It has complete information about tree-planting, blasting between the rows, ditching, stumping, and boulder blasting. Send for it today.

# Walnuts Around the Globe

IN California walnut growing is a highly organized business. Elsewhere in the world it is merely an incident. This is the conclusion of Carlyle Thorpe, general manager of the California Walnut Growers Association, who returned recently from a four months' investigation tour of the principal walnut producing countries to determine the relationship of the walnut business in China, Italy and France to that of California. He found walnuts growing in the temperate belt almost all the way round the world.

In China he visited walnut growing districts lying as much as 1500 miles apart. In one region, adjacent to the great Gobi desert he pressed into country which, it is said, was never before explored by a white man. This trip was made on camel back, with many accompanying hardships and dangers.

"Walnut growing in China and other countries of Asia and Europe is incidental to other agricultural activities," said Mr. Thorpe yesterday. "It is not pursued as a business. One finds the walnut trees growing haphazard, with crops of citrus, flax, grapes, grain, vegetables and other predominating crops.

"There are walnut trees scattered at random over all the farms in the foreign walnut growing countries, but the trees get no such care as they are given in California. The foreign walnut trees get only such care as the coolie or peasant gives to the crops which occupy the surface area of the land upon which the nut tree happens to be growing.

"And yet the production of foreign walnuts is tremendous. The average number of trees to the farm is perhaps not more than half a dozen, and yet the industry is so widespread that the total tonnage is gigantic. It makes sharp competition for the California walnut, and we are fortunate indeed to have recently secured an adequate import duty on the foreign product."

Mr. Thorpe says that the foreign walnut grower is able to produce nuts at a ridiculously low cost, partly because they are a side issue, and partly because his help works from 11 to 16 hours a day at a wage not exceeding 35 to 50 cents a day. The Italian walnut crop will be fully 60 per cent above normal this year, but of only medium quality because of a protracted hot wave during the summer. The crop in France will be 20 per cent above normal and the quality good. The crop in China will be normal because the trees are so hardy that no visitation of extreme weather has any noticeable effect upon them. They plod right along from year to year with about the same average tonnage and uniform quality.

In France Mr. Thorpe found the farming class decidedly prosperous.

"If conditions there are not quite what one might expect, it is probably because of a faulty system of taxation," declares Mr. Thorpe. "The populace in general is well fixed. The old shell holes made by the war, and the barbed wire entanglements have all been smoothed out and bumper crops have again taken their place.

"All of the war torn countries are being rapidly rebuilt, but along lines followed centuries ago. There appears to be no advanced or even modern thought in reconstruction. New buildings are designed as they were hundreds of years ago.

"There is no good system of sanitation, and modern conveniences are sadly lacking. The homes and public buildings have no running water. Water for all purposes is carried from the town wells, sometimes a block or so away. The farming people and the laboring classes in America enjoy comforts of all kinds that have never even been dreamed of by the well to do classes in Europe and Asia."

# Ventura County Fair

By Ernest Braunton

NO account of this splendid fair would be started right, from a horticultural view, if it did not commence with table grapes. These were the finest the writer has ever seen—that is, the largest, both in berry and bunch. In the lot was a new one from Italy, a black grape called "Bonarda," one bunch weighing a little more than 12 pounds.

Aside from smaller individual exhibits, also those in community booths, two growers had each a large table with plates, baskets and boxes of the leading varieties that grape experts from other parts said would do credit to any fair in the land. M. L. Montgomery of Simi exhibited 16 varieties and L. Snow and Son of Sespe 14 varieties. The judges awarded first prize to the latter as a display because the individual grapes were uniformly larger but in firsts among varieties the honors were about even.

### Other Displays

In individual booths of large si e there were but three, but of a high order. First prize was awarded to a school boy, James Thurmond, of Saticoy, the material all grown on "dad's" ranch. The young man is a member of the calf club and said first money would pay for a purebred calf he had just bought; hence the unusual work evidenced in the booth. The second prize went to Thomas Middleton, Santa Rosa Valley, for produce of equal merit but of many less varieties.

One of the most appetizing exhibits was that of a Ventura County "infant industry," the candied or glaced citrus fruit display of the California Fruit Confection Company of Camarillo. They had large boxes and small packages of candied peel of oranges, lemons, pomelos, etc., in halves, quarters, slices, cubes and finely ground, all extremely inviting, but under fast glass covers so that even the judges passed them by with only a sigh.

### Improved Walnuts

The Saticoy Walnut Growers' Association had the largest and most tasteful display of nuts, in four varieties—Placentia Perfection, Santa Barbara Soft Shell and two improved selections from the latter, the Wason and Pride of Ventura.

The latter was selected and perpetuated through grafts by O. E. Tucker of Saticoy. It is as large and of as fine appearance as any of the type shown but the nuts are not so tightly sealed as those of the Wason. This variety was first planted in orchard quantity by the man whose name it bears, but the variety was selected by Gwyn Thurmond of Saticoy who furnished grafts for a 30 acre orchard to Charles Wason, a neighbor. It is most highly recommended for Ventura County planting.

The state department of agriculture had extensive exhibit of rodents and other small animal pests, also of the state's worst weeds, in charge of W. S. Killingsworth. Horticultural Commissioner Call showed the largest and most varied collection of beneficial insects the writer has seen at a county fair. These were in cheescloth cages, together with their unfortunate hosts and branches of the trees they infest, an exhibition of great educational value to students of horticulture.

### QUARANTINE OFFICERS VIGILANT

L. A. Strong of the plant quarantine service reports conviction of shipper of household goods from Utah, for using alfalfa hay as packing material. Though coming from alfalfa weevil infested district, the shipper had sworn to false affidavit. He was fined $50, his goods unpacked at the railway station and hay burned.

### WHEAT STRAW DETRIMENTAL

Soil and crop experts at the experiment station at Geneva, New York, report rather surprising results obtained from the use of wheat straw with horse manure in a series of tests recently brought to a close. Whenever straw was added to the manure, together with some preservative such as peat or acid phosphate, a marked loss of the organic matter of the manure was noted. Also, when fresh straw was added to manure applied to growing crops a decidedly detrimental effect was noted as compared with the results secured from the use of fresh manure alone. No satisfactory explanation of these results has yet been found and the question is receiving further attention from the station experts.

With the addition of peat to a manure straw mixture the loss amounted to 53 per cent during an interval of four months as compared with a loss of 32 per cent where peat was used in the manure alone. In a mixture of manure, straw, and acid phosphate the loss amounted to 35 per cent in four months, while with acid phosphate and manure alone this loss was only 25 per cent.

It is pointed out by the station specialists that the beneficial effects of manure in improving the mechanical condition of the soil are due largely to the organic matter which it contains, so that it is highly desirable to avoid any practice which hastens the loss of this material. So far as the station experiments have gone, it seems that the best results will be secured where acid phosphate is mixed with the manure as soon as it is voided and the mixture stored in a covered shed or pit until such time as it can be conveniently spread on the field. Scattering two handfuls of the acid phosphate in each stall each day and allowing the animals to trample it into the manure is said to be quite satisfactory and much easier than trying to mix the materials in any other way.

### AUSTRALIAN ORANGE GROWERS COOPERATE

Citrus producers of Victoria, New South Wales and South Australia are planning to ship cooperatively to London. Only Navel oranges are to be shipped at first, and special attention will be given to standardization of quality and pack. California orange boxes are to be used and the individual fruit wrapped in paper carrying kangaroo design. The kangaroo will also appear on the box. The state departments of agriculture have been active in working for the success of this cooperative plan. The Sydney Telegraph says:

"This cooperative movement of the orange growers has resulted from the bitter experience witnessed in the past by growers who undertook to ship their commodity privately. The insufficiency of private shipping enterprises, the reports advise, has prompted the producers to form an organization for the handling of their oranges for export."

### SAVE THE OASES OF TUNIS

The gradual encroachment of sand onto the oases of the Djerid of Tunis is bidding fair to swallow them up according to a report to the department of commerce from the American consulate at Tunis. The French government, however, has seen the danger and now there is being constructed an earthwork surrounding the oases at about 300 yards from them. This is surmounted by a palisade of palm leaves against which the wind heaps the invading sand, forming a dune. Tropical trees and shrubs are afterwards planted in this dune, making a permanent barrier protecting the oases which produce a food shipped to every corner of the world.

"Feet in water and head in fire" is the Arab description of the date palm upon whose fruit the 22,000 inhabitants of the oases mainly depend for a living, says T. E. Jeneid of the American consulate at Tunis in a report to the department of commerce. Although there are over a hundred different varieties of dates, the Arabs simply divide them into three main groups—those that will stand keeping, those eaten before maturity, and those eaten after maturity, and it is the date palm of the Djerid which serves the Arabs in as many different ways as the bamboo serves the inhabitants of the Far East. In the first place it is the staple food of the natives, the domestic animals disposing of any waste. The palm leaves are used for the making of hats, baskets, matting and a host of household articles; the long palm itself is used in construction work. Palm trees, when tapped, yield a certain liquid not unlike coconut milk and above five quarts a day for a month is obtained.

### NEW BEVERAGES FROM SURPLUS FRUIT

The Fruit Products Laboratory of the University of California has recently perfected methods of producing carbonated drinks from berries, grapes and other fruits which promise to provide an extensive outlet for much of the state's surplus fruit. The new drinks contain no artificial color, flavor or preservative. They are pure fruit products and have met with favor because of their purity and high quality. They are prepared in the Fruit Products Experimental Factory in Hilgard Hall at the University of California, by methods developed by W. V. Cruess, associate professor of fruit products, and J. H. Irish, chemist in fruit products.

### OILED WRAPPERS FOR APPLE SCALD

Results during 1921 in preventing apple scald in stored apples by the use of oiled paper wrappers have confirmed previous reports that the trouble may be controlled in this way, if the oiled wrappers carry a sufficiently high percentage of oil. The United States department of agriculture has recommended that the wrappers carry 15 to 20 per cent of oil, if they are to be effective in preventing the development of scald.

### DWINDLING FORESTS

If the supply of food consumed by each man, woman and child were reduced by one-third, the pinch of hunger would soon be felt and the cry of famine would undoubtedly be raised.

Yet substitute the word "wood" for "food" and you have exactly what has happened in the use of lumber; for the per capita consumption has dropped from 500 board feet in 1906 to 316 board feet in 1920, says the forest service, United States department of agriculture.

This decreasing use of a fundamental commodity, according to forest experts, is not a result of decreasing needs but a result of forest exhaustion. It is not being accomplished without economic hardships or without curtailment of industrial expansion. It is not a temporary condition that will automatically adjust itself, for even at this reduced rate of consumption we are still cutting our forests more than four times as fast as they grow. The situation proclaims, according to the forest service, that if we are to remain a nation of timber users, we must become a nation of timber growers.

In 1906, when American lumber production reached its highest point, the average per capita consumption of lumber in the United States was approximately 500 board feet. Since that time the per capita consumption has rapidly and consistently decreased until in 1920 the average citizen used approximately 316 board feet. This is a reduction of 37 per cent in 13 years, or nearly 3 per cent a year. Should this decrease continue at its present rate, by 1940 the downward sweep of consumption would approach zero. This, of course, will not happen. The average consumption will ultimately reach a fairly stable level, which will depend mainly upon the extent to which our devastated forests are made again productive. The greatest per capita consumption occurs where wood is plentiful and the population is relatively small. In Washington and Oregon the consumption appears to be between 900 and 1,000 board feet annually per person.

Next come California, Montana, Idaho, and Wyoming, where the rate of consumption is from 500 to 800 feet per person annually. In these states timber is relatively plentiful as compared with the density of the population, and a very considerable expansion has been taking place in the development of farms and other natural resources.

---

More farm implements, machinery and farm wagons were sold in the Chihuahua district of Mexico during 1921 than in any other year since 1912, says Consul Stewart. This was due to peaceful conditions.

---

Spring flowering shrubs should be pruned as soon as they are through flowering. The purpose is to shape up the plant and encourage the natural growth.

---

Corn cut about three-quarters of an inch long is about right for the silo.

THE SECRET OF THE EFFICIENCY OF

KELL-OIL HEATERS

is in the burner and the seven inch stack. More heat, no soot, burns clean and does not clog.

# "Best for Alfalfa"

# TEXAS GULF SULPHUR

(*Identify the genuine by this trademark*)

A better sulphur at a better price direct from the mines of the Texas Gulf Sulphur Co., the world's largest producers of sulphur. In order to fully serve the alfalfa growers in this territory we have established a warehouse in Portland, Oregon, from which we will make quick shipments of the genuine Texas Gulf Sulphur in any quantity. You will find the product, the price and the service right in every respect. No matter where you have been securing sulphur in the past you will find it greatly to your advantage to place your order with us this season.

*Contains 99½% Pure Sulphur*

*Packed in 100 lb. Burlap Bags*

## *Your Choice of Three Forms:—*

### *Crude Sulphur—*

Lump sulphur, 99½% pure, for those who prefer to do the grinding.
In bulk or 150 lb. bags

### *Flour Sulphur—*

Ground to extreme fineness, ready for immediate application to the soil. This product is so finely ground that it is in every respect equal to special brands for which high prices are commonly charged.
In 100 lb. burlap bags

### *Inoculated Sulphur—*

An exclusive Texas Gulf product. Specially ground flour sulphur inoculated with sure-acting oxidizing bacteria which make the sulphur quickly available for plant food. As commercial sulphur is apt to be inert in the soil and its full effects are usually not noted until the second season, we advise the use of Texas Gulf Inoculated Sulphur where quick action is needed, and especially for late applications. In any event, test it on an acre or two this season and compare results.
In 100 lb. burlap bags

### *Consult your County Agent*

We will gladly cooperate with him and with you in handling club orders. Naturally, you can save money by joining with your neighbors and making up a carload order.

### *Wire us at our expense—now!*

Send us a night letter, *charges collect*, tonight. Tell us your alfalfa acreage, the kind and amount of sulphur you will require, the name and address of your county agent or dealer. Address as below. We will promptly quote prices which will delight you.

*Our Sulphur Booklet and other helpful literature mailed free on request*

# Underirrigation

According to a statement just issued by Farm Adviser Hodgson of Los Angeles County the recent series of field meetings on irrigation nad control of soil moisture held in the citrus districts of that county has indicated a rather surprising condition. Instead of what many investigators have surmised to the effect that overirrigation is the rule, the hundreds of borings made in the course of these field meetings showed rather conclusively that the average citrus orchard in Los Angeles County at this season of the year has been underirrigated. Ninety per cent of the borings made in orchards showed the soil moisture below the optimum. Growers were astonished in many cases at the results found through the use of the soil auger. In one case where water had been applied two weeks previous borings were made in the irrigation furrows and between them. In the irrigation furrows which were spaced at intervals of three feet soil was found to be nearly bone dry to a depth of six feet. In many cases the upper foot or 15 inches of soil showed fairly good moisture conditions, but below that depth the soil was entirely too dry for proper developing of feeding roots.

As a result of this field study it is apparent that the average citrus grower has either not been applying sufficient water to take care of the needs of his trees or has been applying it at too great intervals to meet the demands of the feeding roots. Actual measurements of the amount of water applied tends to verify the conclusions reached through the borings, it having been found that many growers are not using more than 15 acre inches of water during the year. The water requirement of citrus trees is generally regarded to be between 35 and 50 acre inches per year. Subtracting that part of the winter rainfall which penetrates the soil and does not run off in almost all sections leaves a requirement of from 25 to 30 inches to be applied during the irrigating season.

As a result of the meetings, which were largely attended and productive of great interest, it has been decided to locate demonstration orchards during the coming year which will be irrigated following the recommendations of the extension service, these recommendations being determined by the use of the soil auger at frequent periods.

# Preserving Fruit for Exhibition

The following directions taken from Extension Service Farm News of the Texas college of agriculture are of interest to those who are preparing fresh fruits for exhibition at the fall fairs or chamber of commerce exhibits:

In preserving fruits for exhibition results depend as much on the state of ripeness of the fruit and the care with which it is handled as on preserving material used. Fruit for exhibition purposes should be picked when hard ripe, not overripe. Extreme care should be exercised that the fruit is not bruised and it is useless to attempt to preserve for exhibition any fruit that shows a trace of decay. Such fruits should be handled so that none of the bloom is removed.

It is best to keep all fruits for processing in a cool, dark place for 24 hours before they are placed in the preserving fluid. The jars should be filled to the neck with carefully selected specimens and then filled with the fluid to within half an inch of the top of the container. The containers must be made air tight and placed in a cool, dark place. They should be examined every day or two, and if the liquid is cloudy or the fruit does not appear to be keeping properly, all of the liquid should be poured off at once and replaced with fresh solution.

Where glycerine or glucose is used and the fruit cracks, this shows that too much has been used, and the liquid should be immediately poured off and a smaller amount of glucose or glycerine used. Should the fruit shrivel, it shows that not enough glycerine or glucose was used and more should be added.

Below are given a few successful formulas:

Dark colored fruit: (1) To every gallon water add 1½ ounces formaldehyde and 1 quart glucose.

(2). To every gallon of water add ¼ ounce salicylic acid and 3 fluid ounces glycerine.

(3). Two ounces of boric acid to 1 gallon water.

(4). Formalin 1 pound, water 4 pounds, alcohol 5 pints. Allow the mixture to stand and should there be any sediment pour off the clear liquid and filter the remainder through filtering paper.

(5). Formalin 1 pint, salt solution 2 pints, water 17 pints.

(6). For a short time strawberries and other dark colored fruits may be preserved fairly well in a saturated solution of common salt.

Light Colored Fruit: (1). To 1 gallon of water add 2 ounces of fresh sulphurous acid, stir well, then add 1½ ounces glycerine.

(2). To 1 gallon of water add 1 pint sulphurous acid, 1 pint alcohol.

(3). Dissolve 1 pound zinc chloride in 2 gallons of water. Stir until thoroughly dissolved, then add 3 pints alcohol, let stand until clear and filter.

(4) To 1 gallon of water add 1 pint glycerin, 5 ounces powdered borax. Then after 15 days add 2 ounces sulphurous acid to each gallon of mixture.

Fruit preserved by the above formulae is for exhibition only and is unfit for consumption.

### VINE PRUNING SYSTEMS

Frederic T. Bioletti is author of Circular 245 of the College of Agriculture, U. C. It is only a four page circular but has many suggestions on pruning. Prof. Bioletti's conclusions are:

In nearly all cases where the head pruning system is known to give perfectly satisfactory results, it should be chosen. It is the most economical and best understood by most grape growers. It usually gives good results with the following varieties of grapes:

Medium trunk: Muscat, Verdal, Palomino, Zinfandel, Alicante Bouschet, Duriff (Petite Sirah), Beclan, Grand Noir.

High trunk: Tokay, Rose of Peru, Black Prince, Mission, Malaga.

Cane pruning should be adopted only when neither of the other systems gives as good results. It is used almost always for Sultanina, Sultana, Black Corinth, Pierce, Concord, Isabella, Catawba and most Labrusca varieties.

Cordon pruning can be recommended for Emperor, Ohanez, Cornichon, Molinera, Black Monukka, Zabalkanski, and most vigorous large fruited table grapes, especially when growing is very fertile soil.

### BIG POTATO CROP

"With a prospective potato crop of 440,000,000 bushels this year and a corresponding decline in prices, grading becomes increasingly important if producers are to receive a fair return for their labor," says F. G. Robb, marketing specialist for the United States department of agriculture. "The department's records show that in a season of abundant supplies and low prices only products of high quality command the attention of buyers. Under such conditions it is almost impossible to market ungraded or mixed potatoes except at a loss."

### CROPS AND HARVEST

Agricultural conditions in the twelfth district are reported by Chairman Perrin of the federal reserve board under date of September 27:

Weather conditions up to September 15 remained favorable for crops of the district, and the harvest is expected to yield in most cases normal or larger than normal quantities. Fore-

casts of the 1922 yield of wheat remain unchanged at 98,000,000 bushels, 24,000,000 bushels less than were produced in 1921, but slightly in excess of the five year average production. Movement of this season's crop to market up to September 15 has been unusually slow. Flour mills are now grinding new crop wheat and in August, 1922, operated at 47.2 per cent of capacity compared with 28.7 per cent in July, 1922, and 43 per cent in August, 1921. The carlot movement of fruit from California to September 1, 1922, was larger than last year to the same date but prices received have averaged lower than in 1921. Shortage of refrigerator cars is hindering shipment of the large grape crop.

### COLD STORAGE AIDS IN MARKETING PLUMS

Cold storage can be used as an aid in the marketing of California plums, is the finding of Professor E. L. Overholser of the pomolcgy division, University of California, as a result of investigations in this problem. The plum has not been regarded heretofore as a cold storage fruit, being stored at most only a few days to avoid a temporary glut of the market.

The investigations reported in Bulletin No. 344, indicate that certain varieties of California plums can be held in storage for optimum periods of about six to twelve weeks. After removal from storage these plums will hold up in good dessert condition for an ample period to admit of handling on the market.

A copy of Bulletin No. 344 may be secured by addressing Director of Agricultural Experiment Station, Berkeley.

### TIME TO USE PARADICHLOROBENZENE

In Ohio they have figured out dates for using paradichlorobenzene for killing peach borer. Their dates may have little interest for California excepting they may help us to fix on our own best dates which presumably are later than in temperate climate sections. The experiment station of that state suggests:

Gas attacks on the peach borer should be delayed in the southern part of the state until the middle of September and should be concluded by mid-October. In northern Ohio the paradichlorobenzene treatment could have been applied two weeks earlier and should be completed two weeks earlier.

It is not that the chemical will not work at any time when there is sunshine; only that the fall brood of peach borers will not hatch in the lakeshore counties until around the first week of September nor in the southern counties until the middle of the month. Treatments applied before this hatch take place miss a good part of the brood.

T. H. Parks, extension entomologist, tells how to use the paradichlorobenzene. It comes in powder form and is laid down in circles around the trunks of peach trees, where it releases a gas that seeps into the ground and gets the borers. He says:

"Clear the ground and level it for a circle of 6 inches from the trunk. Remove gum from the bark and then lay down the girdle, using not more than an ounce of the chemical on mature trees and less than an ounce on trees between four and six years old. Make the girdle about six inches from the trunk and about an inch wide. Cover with fine soil, compacted to a cone, and let it stay for about three weeks."

### TOP-WORKING OVERWORKED

There seems to be a fad at present, more common in city and town than in rural districts, for top-working all sorts of trees that have not proven satisfactory. Such changes in orchards where the majority of trees are good producers is advisable. But if one has an orchard fruitless by reason of lack of care, top-working will not prove of aid. An owner of a hillside apricot orchard on stony, clayey soil, where trees had never received sufficient water, asked what he could top-work them to that would produce fruit. The only course of procedure in this case would be to root trees out, blow holes with dynamite and start anew. The soil is clayey and mixed with stone, but of good depth. But this note is written to warn tree owners that if trees are in poor condition top-working is not justified. Top-work only vigorous trees, no matter of what kind or class.

### REDUCTION OF RATES ON GREEN FRUITS FROM UTAH

In the very near future Utah will undoubtedly be shipping green fruits including apples and peaches, to markets east of the Missouri River on a reduced rate schedule.

This reduction comes as a direct result of the conference between the Utah State farm bureau and the Union Pacific, later taken up with the interstate commerce commission, on the rate applying on potato shipments.

### FREIGHT RATES ON FARM PRODUCTS

(Continued from Page 389)

ever it may be, places them at no disadvantage in meeting competitors. Second, our business and industrial life has been built up on a system of relatively low railroad rates for agricultural crops, designed to encourage their movement over long distances to industrial and business centers. A sudden reversal of this theory of rate making results in great economic injustice, from which the farmers are suffering now, and if persisted in will keep us in a state of confusion and agricultural and business uncertainty for a prolonged period. The increase in freight rates by the horizontal method, having little regard to the character of the product and to the economic effect upon the business of the nation, is wrong in principle and cannot be continued without baneful results to agriculture.

"Freight rates on farm products must be brought down without impairing in any way the efficiency of the transportation service."

"Better late than never" was written as an agricultural axiom by Thomas Tusser, an English farmer, in his "Five Hundred Points of Good Husbandry," one of the first published works on agriculture in English.

Have You Seen Oakland's 1923 Closed Cars?

The moment you see these beautiful New Oakland closed cars, you will want to own one or the other. Somehow you will feel, instantly and keenly, that the entire motor car market has no more satisfying cars to offer you.

Both of the new 1923 bodies are built by Fisher. Their new and distinctive beauty; their graceful lines; the wealth of their interior appointments and refinements; their comfortable all-weather riding qualities and their complete mechanical dependability—all will impress you with the unusually high quality of these new models.

Mounted on the standard Oakland chassis, both of these new cars are powered with the six-cylinder, overhead-valve, Oakland-built engine—the only engine in the world with a performance guaranteed in writing for 15,000 miles.

Combining beauty with substantial and enduring mechanical construction, these closed cars possess that quiet, smooth and flexible performance so necessary to complete closed car satisfaction.

We ask only that you see these new models and compare them critically with any others built. After that, we feel certain you will share our sincere belief that they offer a greater measure of beauty and utility than you can possibly find elsewhere at prices so remarkably low.

OAKLAND MOTOR CAR COMPANY, PONTIAC, MICHIGAN
*Division of General Motors Corporation*

The New Oakland Six

*Oakland's special written, 15,000 mile engine guarantee is conclusive proof of the in-built dependability of the new 1923 Oakland. It is possible to give this unusual guarantee only because of the high quality in every part of this car's sturdy construction.*

## FRUIT BY-PRODUCTS

(Continued from Page 387)

### Fuel Efficiency

To put another way: If one gallon of crude oil is burned and evaporates 135 pounds of water, the fuel efficiency is 100 per cent. If it evaporate less than this amount of water the efficiency is less than 100 per cent. This fact affords a simple means of comparing the efficiency of different dehydraters. The weight of fresh fruit minus the weight of the dried fruit will give the weight of water evaporated in a given case. This figure multiplied by 1000 and divided by the gallons of oil used times 135,000 will give the relative efficiency of the plant in question. Or it may be expressed thus:

(Pounds of green fruit—pounds of dry fruit)x1000 divided by gallons of oil x135,000 equals fuel efficiency.

For a good dehydrater the result should exceed 40 per cent. Very few dehydraters will show an efficiency in excess of 50 per cent; a number are below 40 per cent and a few are as low as 25 per cent. The fuel cost is one of the most important items in the cost of dehydration, therefore, before buying a dehydrater investigate by actual trial or obtain the record of an official test of the type of dehydrater in question. It is also necessary that the dehydrater frunish enough heat to cause rapid drying.

### Necessity of Air

The rate of drying is markedly influenced by the velocity of the air used in drying. The difference between an oven and a dehydrater is one of air flow. Some so-called dehydraters are more properly termed ovens.

Air has two functions in the drying of fruits. It carries heat to the fruit, causing the fruit to give up its moisture and, secondly, it carries the moisture so liberated from the dehydrater. The former function is much the more important of the two and is the one that should be considered in calculating the size of fan that will be required for a dehydrater of given size. From four to eight times as much air is required for the purpose of carrying heat to the fruit as is required for transporting the moisture from the dehydrater. Some manufacturers of dehydraters in the past have used the moisture carrying property of the air as a basis of calculation for the amount of air required, with the result that their dehydraters dried the fruit very slowly and were extremely inefficient. I am glad to report, however, that most dehydraters being built this year are adequately supplied with air.

### Volume of Air Required

If the capacity of the dehydrater is known, that is, if the tons of green fruit per charge is known, and the drying time for that variety of fruit in a well designed dehydrater is also know, the volume of air per minute required to dry the fruit in the desired time can be estimated and the size of fan required can be determined. Thus, if the dehydrater is to hold ten tons of prunes and is to dry them in 24 hours with a drying ratio of 2½ to 1 it will be necessary to remove 12,000 pounds of water per 24 hours or 8.3 pounds of water per minute. It has been found that there should be a minimum supply of 1750 cubic feet of air per minute to remove one pound of water per minute; or in the above case 8.3x1750, or a minimum of 14,525 cubic feet per minute would be required. If various heat losses and leakage are taken into account it will be found that the dehydrater should be supplied with at least 20,000 cubic feet of air per minute.

Static pressure of air friction in the dehydrater will reduce the amount of air delivered by the fan in proportion to the amount of friction or static pressure exerted. Thus a long tunnel or small air passage will increase the static and reduce the air flow. Consequently this condition must also be taken into account in determining the size of the fan and the horsepower of the motor to operate the fan. A tunnel of the usual type and holding the above amount of fruit will show a static pressure of 1.5 to 2 inches. Fan tables are obtainable showing the size of fan and horsepower for motor to deliver various volumes of air at these static pressures.

Make all due allowances for static pressure and for volume of air required and add a safety factor of at least 25 per cent to care for unexpected contingencies. Very few dehydrater builders have made the mistake of installing fans that were too small for the purpose.

A safe way of estimating the amount of air needed is to allow 250 cubic feet of air per minute for each one hundred square feet of tray surface.

### Recirculation

Recirculation of the air is extremely important for two reasons: First, for the conservation of fuel; and, secondly, for the purpose of controlling humidity of the air. From three-fourths to two-thirds of the air can be used repeatedly and the remainder allowed to escape from the dehydrater. The extremely low fuel efficiency of some dehydraters has been due to the fact that no provision was made for the recirculation of the air used in drying. The old stack and Oregon tunnel forms of dehydraters are objectionable for this reason. In the old forms of dehydraters, or, we may say evaporaters, all of the air is allowed to escape from the ventilator and none of it is used a second time. The Oregon experiment station is attempting to persuade the growers in Oregon to install fans and recirculation flues in these driers to increase their efficiency and to improve drying conditions. The return flue or duct should be large in order that the flow of the air is not impeded; a great deal of difficulty has been experienced in some plants because of the inadequate size of the return flue.

### Selecting the Dehydrater

What style of dehydrater is most desirable is the eternal question that is asked Professor Christie and others of us at the university; and we are even asked which particular make of commercial dehydrater is best. We can answer question number one; but number two can only be answered by yourselves. We are not selling anyone's dehydrater and are not advocating anyone's dehydrater. It is up to you to make the necessary investigation yourselves; but we can tell you how to make the necessary comparisons. We have found that all things considered, that form of dehydrater known as an "air blast tunnel dehydrater" is most satisfactory. There are a number of different companies building this type of dehydrater and most of their machines are reliable.

Shall you build your own or shall you buy your plant from an established company? Take your choice. The former method requires that you make a careful study of dehydrater building and that you spend a great deal of your time buying materials and in supervising the building of the plant. You may save some money by so doing, just as is the case when you build your own house; but you may also make several very costly errors and have to spend much time and money rebuilding the plant without having a satisfactory dehydrater. If you hire an established concern to build the plant you are relieved of this responsibility, but, of course, must pay for the service. The University does not have the necessary draftsmen and facilities for preparing the elaborate plans and specifications required for the building of dehydraters, although sketches are available in the monthly bulletin of the state department of agriculture for February, 1921. However, I would say for your information that the sketches there given are somewhat out of date, because of the rapid progress made in the past two years in dehydration. Professor Christie is now giving all of his time to dehydration problems and is glad to advise with you whenever you should feel that you are in a position to seriously consider dehydration as a means of caring for your surplus fruit.

### Summary of Principles

By way of summary of the principles of dehydration, I would state that a dehydrater should embody the following points:

1. It should be an air blast tunnel type, preferably horizontal blast.
2. It should have an adequate supply of heat.
3. It should have ample air flow; at least 250 cubic feet, per minute per 100 square feet of tray surface.
4. Air flow over the trays should be uniform.
5. Fuel efficiency should exceed 40 per cent.

Last, but not least, the dehydrater should not be so costly as to be unprofitable. Experience has shown that a good dehydrater can be built for less than $500 per green ton capacity per 24 hours. Thus, if the dehydrater is designed to dry 10 tons of prunes per day, it should cost not more than $5,000.

### Dehydration of Cling Peaches

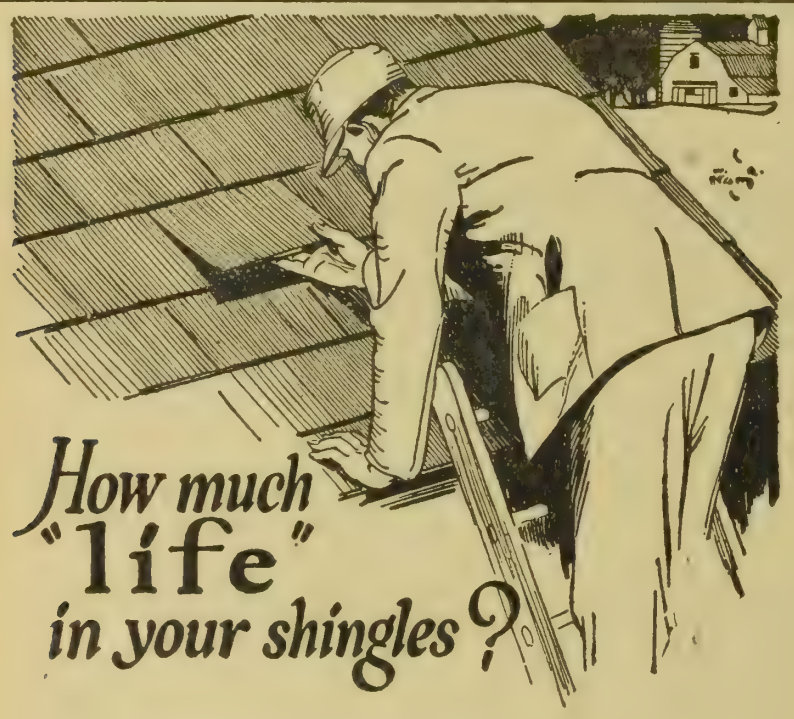
Professor Christie has dehydrated 4 tons of Tuscan Cling and 2 tons of Phillips Cling peaches at the university farm in the dehydrater of the fruit products division. The fruit was lye peeled after hand pitting and halving. Ordinary cannery equipment could be used for this purpose. The dehydrated fruit is of beautiful appearance and excellent cooking quality. When refreshed by overnight soaking in water it returns to its natural color and form perfectly and closely resembles the canned fruit after such refreshing.

The drying ratio on the cling peaches is greater than for freestones; because of the lower sugar content of the former.

The fruit has been placed in half pound cartons under the university label; samples are shown herewith. This will be offered for sale in the bay cities and we shall within a few months have data on the response of the public to this new product. We believe that it is a winner and is destined to find a place in California's fruit industry.

### Dehydration of Freestone Peaches

Muir and Elberta peaches were de-



How much "life" in your shingles?

Natural oils are life to wood—particularly shingles. But summer suns and dry, hot winds quickly evaporate the original strength of even the best shingle roofs, if unprotected.

ORONITE SHINGLE OIL assures maximum preservation of shingles — penetrates the pores of the wood and holds in the sap. In roofs or shingled side walls treated with ORONITE SHINGLE OIL, there is the strength of live timber—sturdy defense against all kinds of weather. Old roofs can soon be renewed by its application.

Our agent, near you, will show you how easily ORONITE SHINGLE OIL may be applied — will give you color formulas, too, for decorative use.

114 So. Claudina St., Anaheim

hydrated at the university farm two years ago with marked success. The fruit was not lye peeled, but was merely cut in half, sulphured and dehydrated. The product was received at the packing house as first quality. We believe, however, that this fruit should also be lye peeled and sold in carton packed form. It would then be distinctive and more attractive than the usual sun dried product and would not have to compete with it.

I am "sold" on the idea, to put it in a slang phrase, of dehydrating your surplus freestone and also clingstone peaches. I am, however, certain that if you do not peel the fruit and offer it in carton form, any attempt to dehydrate and sell such fruit in competition with the sun dried fruit is doomed to certain failure. If you are going to undertake this method of caring for your surplus fruit, you will have to forget sun drying methods and "do the job" properly. There are no two ways about this fact.

### Dehydration of Plums

Freestone plums make a beautiful dehydrated product; some of the red varieties being particularly desirable in this form. Clingstone varieties can be lye dipped as is done with prunes, sulphured a short time and dehydrated. We have dried only very limited quantities in this manner but find the product very promising. In spite of their high acidity, plums have considerable sugar and the drying ratio is about the same as that of apricots; judging from our extremely limited data.

More work must be done on the dehydration of this fruit, but we believe that it has possibilities. What the market would be no one can say. Canned plums are not used in any great quantity. Whether you could persuade the housewives of America to eat dehydrated plums, I am unable to predict; but there is at least a good gambling chance that you could persuade them to at least try them; and one trial would probably bring return orders.

My advice would be that you make the old "standbys," such as dehydrated peaches and pears, bear the expense of the venture and pay the way for dehydrated plums.

### Dehydration of Pears

In 1920 we dehydrated several tons of unpeeled halved pears in the university farm dehydrater. They were of good flavor and cooking quality, but not attractive in appearance. Others have had the same experience.

This year Professor Christie has dehydrated about six tons of pears after hand peeling, coring and halving. The peeled pears were sulphured a short time and were then dehydrated at a moderate temperature. The finished product is of excellent appearance and even better cooking quality. It is a first class product in every way. It cooks well and makes fine pies. It has a real pear and not a sulphur flavor. It has sufficient merit to be used in any household and we believe represents the only feasible method of dehydrating pears. The cost of drying is, of course, very high compared with that of sun drying; but it is possible that a means of mechanically or chemically peeling pears will be devised and the cost of preparation thereby reduced.

The dehydrated pears have been carton packed under the university label and will be offered for sale at a price high enough to cover the cost of preparation and dehydration.

(Next week, Fruit Beverages, Candies, etc.)

## WHAT THE ELECTRICAL INDUSTRY HAS DONE FOR CALIFORNIA

(Continued from Page 385)

per capita consumption of electricity in California in 1921 was 1085 kilowatt hours, as against an average for the United States of 372 kilowatt hours.

Perhaps the most notable part of this intensive service has been the development of agricultural uses of power. California has pioneered in the reclamation of arid lands through the use of electricity in pumping water and the land so reclaimed in this state exceeds that of all the other states combined.

In 1920 there were in California 1,470,000 acres under irrigation by water pumped electrically, as against 4,500,000 acres under gravity flow. In ten years from 1910 over 1,000,000 acres were reclaimed by the agency of electricity. Over 500,000 horsepower of motors are installed in this service, requiring 17 per cent of the total power generated.

Under private initiative there was built in California the first long distance transmission line, 20 miles at 10,000 volts, from San Antonio to San Bernardino, by the San Antonio Power Company. Under private initiative in California the world's present record in long distance transmission was achieved by the Southern Sierras Power Company, 539 miles at 87,000 volts, from Mono County to Yuma, Arizona.

Under private initiative the highest voltage transmission in the world has been attained in California by the Pacific Gas and Electric Company, 202 miles at 220,000 volts, from the Pit River in Shasta County to the San Francisco Bay region.

All these records, made through private initiative and private ownership were not accomplished in a day, but are the result of careful planning and years of experimenting.

The Pacific Gas and Electric Company, largest of the western power companies and second largest utility of its kind in the world, has been largely the pioneer in the hydro-electric development of the West. Just 27 years ago a little plant on the American River at Folsom was put in service by two far sighted engineers of that time, John Martin and Eugene deSabla. This was the first high head hydro-electric plant of commercial importance in the United States. Its builders not only pioneered the generation of electricity by water power but succeeded in transmitting the energy generated a distance of 22 miles to Sacramento at the record breaking pressure of 11,000 volts. This was the first step in the industrial development of the West, the nucleus of a hydro-electric generating and distributing system that has today developed into the greatest in the world.

Folsom power house is still in operation after nearly 30 years of continuous service, and though relegated to comparative insignificance by the giant plants built in recent years, it still pours its flow of energy into the network of transmission lines that extends from one end of the state to the other.

During the next few years following the Folsom installation new wonders were accomplished. In 1899 the Colgate power house on the Yuba River was completed and engineers succeeded in delivering the energy to Sacramento, 61 miles distant. But even these achievements were surpassed when, in 1901, the power from Colgate was transmitted over a line 140 miles long to San Francisco at the amazing pressure of 40,000 volts, the first linking of the water power of the Sierra streams with the cities of the coast. In order to bring the power of the Yuba to San Francisco it was necessary to cross the Straits of Carquinez, the water gateway to the interior valleys of California and another unprecedented engineering feat was performed when the longest aerial span ever built for the transmission of electricity was stretched across the waterway. For upwards of 20 years electric energy has been coursing through the copper strands of the great span, night and day, without a moment's interruption to service.

The next record to be broken by the engineers of the Pacific Gas and Electric Company was the building of deSabla power house. Here water derived from an old mining enterprise was carried from the West Fork of the Feather River and dropped a distance of 1500 feet through great steel pipes to the power house in the canyon below. This established the world's record for high head generation of hydro-electric energy.

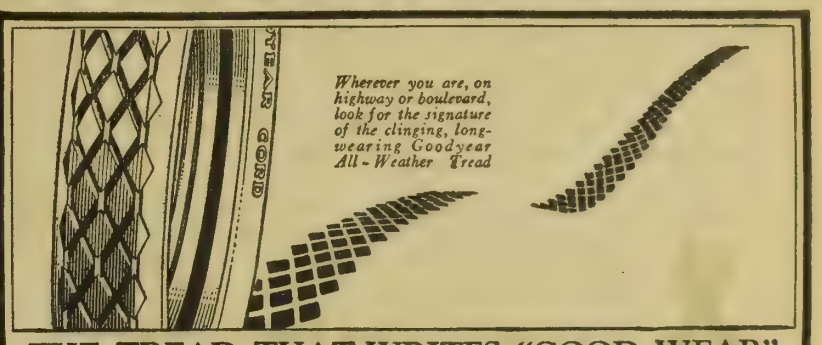
These were the pioneer plants whose little water wheels have been dwarfed by the giant turbo generators of today. But in the development of these projects engineers learned the necessity for cheap power and the almost unlimited potentialities of California's water power resources.

In 1913 the Pacific Gas and Electric Company completed the first great hydro-electric project of the West, the Lake Spaulding Drum development, situated among the peaks of the Sierras. Today the great Spaulding dam, towering 225 feet above the native bedrock of the South Fork of the Yuba, stores the waters of the river until needed by the chain of power plants below. Drum power house is the largest of these, with a generating capacity of 53,000 horsepower.

And so one record breaking achievement followed another. Larger and larger plants were built, higher and higher voltages were utilized in the transmission of power, until today the Pacific Gas and Electric Company ranks as the second largest utility of its kind in the world, operating 29 hydro-electric plants and four steam-electric plants with a combined generating capacity of 595,000 horsepower.

The crowning engineering triumph of all, however, has just been accomplished. In September of this year the first of a series of five giant plants on the Pit River in Shasta County began to transmit its energy a distance of over two hundred miles across the Sacramento Valley to Vacaville, the first transmission system in the world to be constructed for 220,000 volt operation.

Such is the story, briefly told, of some of the achievements that have been wrought during the last 30 years by the power companies of the Pacific Coast. The comforts, conveniences and necessities that are afforded by electricity today are due to that group of farsighted, public spirited men who attempted the "impossible" and succeeded in building up a great electric power system that is second to none in the world and is today the greatest controlling factor in the development of California.



GOODYEAR
Wherever you are, on highway or boulevard, look for the signature of the clinging, long-wearing Goodyear All-Weather Tread

THE TREAD THAT WRITES "GOOD WEAR"

Spread before men's eyes, on the roads of all the world, is the record of Goodyear popularity.

You will find it on city pavements, in country lanes, on mountain passes and in the trails of far places.

In clear, familiar characters the All-Weather Tread has written it there.

And with it, it has written also a story of extremely efficient service.

No one can look at that deep, clean-cut Goodyear imprint and not realize what great traction and security it affords.

No one, seeing it far-scattered over the earth, can mistake in what overwhelming regard the Goodyear Tire is held.

Only a tire that consistently delivers profound satisfaction to its users can win and hold such regard.

Only a tire that gives great and economical mileage, and performs reliably always, can deliver such satisfaction.

When you buy tires, buy the tire that through its excellence has won more users than any other kind.

Buy the tire with the tread that writes "Good Wear."

*Goodyear Means Good Wear*

Niles, California

## Improve Your Orchard Work

Case farm tractors have many advantages for orchard work. They furnish dependable power for the thorough, frequent cultivations needed in orchard work. They operate with extreme economy. Their durability reduces the yearly cost of orchard care to a very low figure. They are adapted to every kind of power work required in modern orchard operation.

***Dependable power*** is furnished by Case-built engines, of most efficient type—four cylinder vertical, valve in head, with well balanced parts, designed for continuous operation under heavy loads.

***Fuel economy*** is secured with a simple, single adjustment carburetor and a specially designed manifold with heat control for the successful use of low grade fuels.

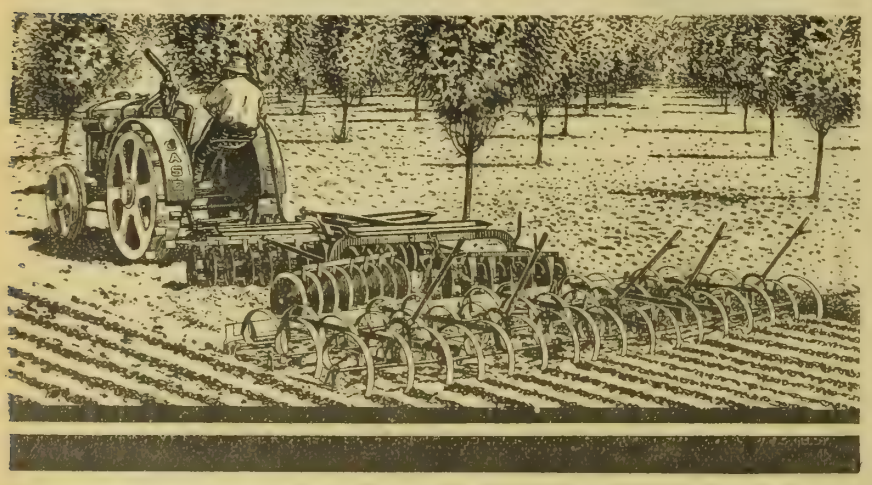
***Durability*** is assured by the use of special steels, high grade roller and ball bearings, by careful attention to lubrication, by enclosing all working parts so that dust and dirt cannot enter. All bearings are replaceable and all working parts easily accessible for adjustment.

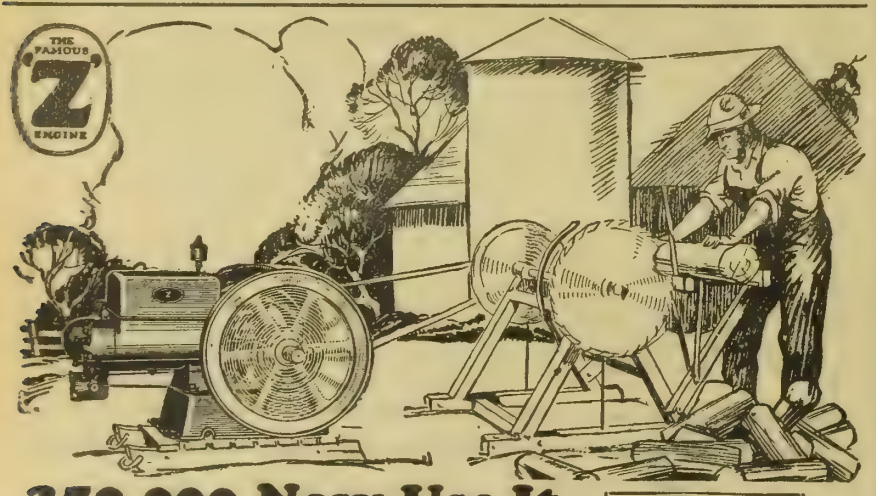
Short turning and flexible steering give the operator complete control of the tractor and implements used in orchard work.

Complete information about sturdy Case tractors is contained in our new book "Better Farming with Better Tractors," just off the press. Write for a copy today.

**J. I. Case Threshing Machine Company**
(*Established 1842*)
Dept. X4 Racine Wisconsin

Branch Houses at San Francisco, Los Angeles, Cal.; Portland, Ore.; and Spokane, Wash.





## 350,000 Now Use It

The simple, dependable Fairbanks-Morse "Z" Engine has taken much of the drudgery out of the work on more than 350,000 farms. Don't waste your own time and strength on blistering, back-breaking jobs that this engine can do quicker and easier. At present low prices, it is the cheapest "hired help" you can get.

The magneto equipt 1½ H. P., 3 H. P., and 6 H. P. are *real* kerosene engines, but operate equally well on gasoline. Simple, high tension oscillating magneto produces hot spark, starting engine quickly. Throttling governor assures steady speed. Prices, F. O. B. factory:

**1½ H.P.-$71.00 3 H.P.-$105.00 6 H.P.-$168.00**

Other "Z" Engines up to 20 H. P.

*Write us for complete details.*
*See the engines at your dealer's.*

The new "Z" 1½ H. P. battery equipt uses gasoline alone. Has high tension battery ignition, hit and miss governor and balanced safety fly wheels. Control lever gives six speed changes. Carburetor requires no adjusting. A remarkable value

**$48.00** F. O. B. Factory

# The Grain Futures Act

THE full cooperation of the grain trade in the administration of the grain futures act was urged by Dr. H. C. Taylor, chief of the bureau of agricultural economics, United States department of agriculture at the annual meeting of the Grain Dealers National Association at New Orleans. Dr. Taylor stated that in securing the facts regarding the handling of grain and the charges made for the service, the department took an unbiased attitude and was interested solely in the development of the most efficient system of marketing farm products, without prejudice to anyone from producer to consumer.

"If the facts disclosed satisfy farmers that grain is being handled in an efficient manner and for a fair charge, farmers will probably not desire to compete in or to destroy the central grain markets," Dr. Taylor said. "In case the facts do not point to this conclusion, the act carries the basis for making helpful suggestions which will tend to rectify the situation."

In outlining the department's policy Dr. Taylor stated that the department was as much interested in seeing that the legitimate handler of grain received a fair price for his services as it was in educating the farmer to market his product to the best advantage of himself and the national welfare.

The department's attitude toward cooperative marketing and the county agent system was also outlined. Dr. Taylor said: "It is not the policy of the department to participate in the organization or operation of cooperative or corporate marketing undertakings. The department simply attempts to collect and disseminate information which may be useful to anybody who is interested in marketing farm products. It is interested in securing the facts of marketing and getting them to the people concerned. The county agent system was organized as a means of carrying the facts to the farmers, but the function of the county agent is to educate and demonstrate methods of production and marketing and not to organize farmers for other than educational purposes. In the marketing of grain whether by independent grain dealers or cooperative grain dealers we are willing and anxious to help both. Our purpose is to promote the most efficient and cheapest system of marketing by whomever it may be done.

"Apparently the reason for placing the administration of the laws looking toward the regulation of the cotton trade, the meat trade and the grain trade in the department of agriculture is the broad economic point of view taken by this department. While the department is interested in agriculture, it is also interested in those industries and services which are essential to the distribution of farm products. The grain trade has reason to look with satisfaction upon the passing of the grain futures act. Had this act not been passed, bringing with it the reassurance to the people that the grain trade will be operated in the public interest, there is every probability that destructive legislation might have been enacted. The grain futures act is not destructive.

"The department of agriculture recognizes the importance of the functions performed by the grain trade and all of its effort is centered upon the questions of efficiency and fairness. Its point of view is constructive and not destructive. It is interested in the development of the most efficient system of marketing farm products. It is also interested in educating every one concerned, including producers and consumers, with regard to the functions performed by the middleman at the various stages in the marketing of farm products and the elements of cost involved in the rendering of this service. Thus, while the department of agriculture administers many federal acts relating to the distribution of farm products, it looks upon the scientific study of the problems of production and distribution and the education of the people in these subjects as the most important means of putting the business of producing and marketing farm products on a higher plane of efficiency. In order to carry on the research work which is basic to the educational work, the facts must be available. It is through your cooperation that these facts can best be secured, so far as they relate to the marketing of grain."

In Dr. Taylor's opinion the administration of the grain futures act has the possibility before it of rendering the grain trade of the United States a very great service by securing the facts and educating the public with regard to the functions performed and the services rendered by those who handle grain and by the organized markets in which business is transacted.

### CELERY CROP LARGER

Production of commercial celery is estimated by the United States Department of Agriculture at 22,339 cars, or 13 per cent more than the crop of 19,771 cars in 1921. Of this total, Florida produced an early crop of 5,493 cars of 350 crates each, with 4 to 5 dozen bunches per crate. Other states produced a late crop, the total of which is 16,846 cars of 180 crates each, with 8 to 10 dozen bunches per crate. California leads with a crop of 5,000 cars, followed by Michigan with 4,648 cars, New York 4,327 cars, New Jersey 1,150 cars, Ohio 875 cars, Colorado 590 cars, and Pennsylvania 256 cars.

Florida's estimated commercial celery screage increased from 2,260 acres in 1921 to 2,670 acres in 1922, and the acreage of the late states increased from 12,942 acres in 1921 to 14,460 acres in 1922. In yield per acre, Florida's average declined from 768 crates of 4 to 5 dozen bunches each in 1921 to 720 crates in 1922, but in the late states there was a gain in the average from 206 crates of 8 to 10 bunches each in 1921 to 210 crates in 1922.

### GOVERNMENT BULLETINS OF INTEREST NOW

Copies of these farmers' bulletins and circulars of general interest during the fall may be obtained free by addressing Division of Publications, United States Department of Agriculture, Washington, D. C. Specify number and name and whether Farmers' Bulletin or Department Circular.

Farmers' Bulletin 474, Use of Paint on the Farm; 574, Poultry House Construction; 753, Handling, Grading, and Marketing Potatoes; 872, The Bollworm or Corn Earworm; 889, Backyard Poultry Keeping; 900, Homemade Fruit Butters; 903, Evaporation and Drying of Fruits; 991, Efficient Operation of Threshing Machines; 1046, The European Corn Borer; 1049, Baling Hay; 1069, Tuberculosis in Live Stock; 1075, Unfermented Grape Juice—How to Make It; 1080, Preparation of Barreled Apples for Market; 1113, Poultry Houses; 1175, Better Seed Corn.

Department Circular 25, Points for Egg Buyers; 74, Points for Egg Breakers; How to Break Eggs for Freezing; 98, The Installation of Dust-Collecting Fans on Thrashing Machines for Prevention of Explosions and Fires and Grain Cleaning.

### N. A. F. E. M. CONVENTION

The 29th annual convention of the National Association of Farm Equipment Manufacturers, October 18-20, bids fair to be one of the best attended in years. Advance registration indicates a widespread interest in the coming event and a general intention on the part of manufacturers in every line to be present. The convention will be held in Chicago at the Congress Hotel and all manufacturers of farm equipment are invited.

Use of the English language at the meetings of the International Institute of Agriculture at Rome was decided upon by the close vote of 64 to 63. The resolution was opposed by the French and Spanish representatives. Heretofore the French language has been used exclusively, but now both English and French will be spoken. The result is due to the efforts of Leon M. Estabrook, associate chief of the bureau of markets and crop estimates.

# Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

### Dust—Wet Spray

I would like to know if dusting is as effective for codling moth on apple trees as spraying? Also if there is a dust made that will prevent curly leaf on peach trees, and what time of year should dusts be applied to apple and peach trees for the aforementioned pests?—Subscriber, Amos

Dust has been used by orchardists of Monterey and Santa Cruz Counties in the control of codling moth. In drier interior sections the wet spray has been more largely used. For curly leaf of peach we believe the Bordeaux mixture applied a short time before opening of buds in the spring has been generally preferred. Here are two good questions for consideration by those who have tried both forms of pest control. Let us hear from subscribers.

### Transplanting Cypress

Is it safe to transplant a Monterey cypress without balling specimen which is well grown, about 5 to 6 feet in height, planting same day? Is it practical to take with with bare roots protected with burlap? Subscriber, Los Angeles.

It is always safer to ball any tree. Conifers are hardest of all trees to transplant with bare roots when of some size. If all roots are taken, uninjured, and proper care is taken it can be done, though would much prefer to ball. If not balled tree should be moved quickly, not a root allowed to dry, the new hole filled with water, the earth filled in at once and no more water given—unless hot spell comes or rains are late. But top of tree should have cover of burlap or other material, on a frame, not touching the tree, and remain so for not less than a month. The top should be very lightly sprayed once a day, preferably in morning, a mere mist, not enough to water soil beneath except a light drip. This moisture is necessary to keep foliage from wilting or withering until some roots again take hold of soil and start pumping. A few small roots in a ball would keep this up. It would be cheaper to ball.

### Mullein

Has mullein a market value? If so where can it be marketed? It is a great pest here.—Subscriber, Dixon.

Mullein has no market value that we are aware of. It is used as a home relief for asthma, as are cubeb berries, by smoking. But in commercial preparations its place is filled by leaves of Datura Stramonium, the "Jamestown Weed" often called "Jimson."

### Mildew

I enclose rose leaves which turn white, curl up and die. What is cause and remedy?—Subscriber, Rio Linda.

Mildew is the cause of trouble and sulphur is the remedy. It should be used as a preventive, however, rather than a remedy. Mildew, once established, is seldom banished soon enough to help plants. Weather changes usually stop it as soon as applications by man. Plants subject to mildew should be treated like Uncle Josh's faulty fire engine. He moved: "That hereafter the fire engine be inspected ten days before every fire." Sulphur dusted very lightly on foliage and on dry surface under bushes will, in hot weather, destroy or check mildew. In cool weather hot bricks, stones, iron, etc., placed under bushes and sulphur sprinkled thereon will produce equally good results.

### Planting Strawberries

How far apart should strawberry rows be? Is it advisable to cut off runners on vines recently planted?—Subscriber, Porterville.

Rows are almost invariably placed at three feet if cultivator is to be used. If you wish fruit only, keep off all runners. If you wish more plants, take off runners and plant in February. Then keep all cut off during life of plants unless more plants are needed for succeeding years.

### Lawn Grubs

Last year about midsummer the grass in my lawn turned brown and died in spots which started from small round centers and spread outward. We were unable to locate the cause, but this spring, thinking to obviate the trouble, we planted heavily to blue grass and white clover and kept it well watered. Until past the middle of July it looked beautiful. About that time, however, the spots began to reappear and in spite of plenty of water the lawn looks worse than last year. Can you tell me the cause and suggest a remedy?—Subscriber, Ontario.

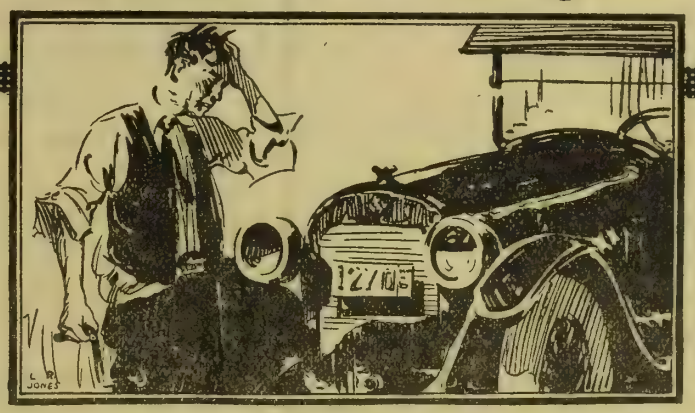
These spots are usually due to the larvae (worms or grubs) of the May beetle or June bug, which eat the grass roots. It is said lime water generously applied after lawn is closely cut will bring the worms to the surface so they may be killed. It is believed tobacco water would perform the same office. Anything that would kill them when applied to the soil would also kill grass and poison soil.

### Red-humped Caterpillar

I am sending specimens of worms that are destroying my prune trees. They work in night and burrow in earth in day time. Please give me name, life history, and how to combat. —Subscriber, Tulare.

Specimens sent are the red-humped caterpillar, Schizura concinna. Eggs are laid on the leaves by grayish moths (which are seldom seen), in May and June. When hatched the caterpillars destroy leaves, all but midribs. They feed rapidly and heavily. When full grown they drop to ground, spin a thin cocoon, and hibernate. The cocoons may be found one to three inches below ground. The new moths emerge about time trees are leaved out. We do not think, after dropping once, that caterpillars crawl up tree again. In small lots hand picking is best way to get rid of them. Where they infest orchard arsenical sprays are best. Hoeing and cultivating close to tree trunk during winter will kill many in the hibernating stage.

# On the Morning You Find Your Battery Dead!



Like every other motorist, you sooner or later have this experience: Some morning you throw open the garage doors, climb into the car, step confidently on the button—*and nothing happens!* Your battery has died in the night.

But why be resentful toward the battery? Rather, dig out the facts and conclusions about batteries you have "filed" in the back of your brain for just such an emergency. You'll probably find they run like this:

"My battery *does* have a hard life. I *do* need the strongest battery I can buy. The Willard Threaded Rubber Battery *does* give longer continuous service at less cost per month and per mile. The use of Willard Threaded Rubber Batteries as standard original equipment by 202 makers is *overwhelming* evidence of quality. On these grounds I have decided the only battery for me is the Willard Threaded Rubber Battery!"

Having once decided, are you going to let expediency, price, or last-minute weakness swerve you when your battery suddenly dies and immediate action is needed? Or are you going to fix that decision *now* with rivets driven through and clinched on the other side?

# Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When queries are wished in Cultivator address query to 317 Central Ave., Los Angeles.

### Collecting

A man purchases vegetables at different times but delays paying for them. He says that some are not fit for use and he pays only half of the amount due. Also, I towed this party when his auto broke down, several miles. Can I require him to pay for this service?—Subscriber, El Cajon.

You are, of course, entitled to bring action against that party for the value of the merchandise delivered and also the value of your services in towing him, and his auto. Such action should be brought in your justice's court, and if it is under $50, you could take the action yourself and it would be of no cost to you as it would go into the small claims court. When you appear before the court you can produce your own witnesses and the court will decide what is proper.

### Community Property

What is community property? The property was owned prior to marriage by either husband or wife. Does this constitute community property?—Subscriber, Anaheim.

Property owned by either spouse before marriage and that acquired afterwards by gift, bequest, devise or descent with the rents, issues and profits thereof is the separate property of the particular spouse. All other property acquired after marriage by either husband or wife is community property.

### Copyright

Could I copyright an idea for the sale of daily papers? How will I go about obtaining it? For what length of time is a copyright in force? What is the cost of obtaining it?—Subscriber, Oxnard.

The copyright law refers to books, maps, charts, compositions, engravings, photographs, paintings, statuary, models or designs, and protects the right of the maker thereof, giving to him the sole rights of publishing, copying or vending the same. The writer can hardly see whereby it would apply to any idea such as stated. Copyrights are granted for the term of 28 years from time of recording the title. In order to obtain such copyright, prior to the date of publication, the person entitled thereto must deposit in the mail, addressed to the Librarian of Congress, a printed copy or description of the work for which he desires copyright, and on the day of publication he must deliver two copies of such copyright to the Librarian of Congress. The fees therefore to which the librarian is entitled is 50 cents for recording the title and description together with certain other fees for assignments and certified copies.

### Barn on Government Land

I have filed on a piece of govern ment land on which there was a barn. A neighbor claimed the barn was upon his land, but on survey it was found to be on mine. He wished to tear it down. I prevented that. He stored hay in it and now wishes to remove the hay. What can be done?—Subscriber, Cobb.

A law of California provides that a certificate of purchase or location of any lands in this state issued or made in pursuance of any law of the United States or of this state is primary evidence that the holder or assignee of such certificate is the owner of the land described therein. From that statement of the law it naturally follows that you can prevent your neighbor from trespassing on your property. Of course the act of entering upon your land to tear down the barn or to remove hay therefrom would be an act of trespass. He is therefore entitled to do neither.

### Responsible for Damages

A lady went to town with horse and buggy to do shopping and took neighbor with her. The horse became scared, ran away, smashed the buggy, and both were somewhat injured. Who is responsible for the damages and loss?—Subscriber, San Fernando.

It makes comparatively little difference as to compensation paid for the transportation. The owner of the vehicle is required to exercise, of course, care, skill and diligence in driving. It would be, therefore, dependent solely upon whether the accident was caused through the negligence of the owner of the buggy or the negligence of some other person. If through the negligence of the owner, then she, of course, will be responsible for whatever damages her neighbor has suffered together with damages to the buggy. Otherwise the person through whose negligence the accident occurred would be responsible. It can hardly be seen how the passenger could be responsible in any way.

### Water Right

I recently bought land and put down a well for irrigating purposes, about 600 feet from the well of my neighbor. After I had pumped a few days my neighbor claimed that his water level was lowered to such an extent that he no longer was able to pump water with his present plant and demands that I cease pumping and pay him damages or he will bring an injunction. What are the rights of the parties?—Subscriber, Elsinore.

It has recently been held in the case of San Bernardino vs. Riverside by the supreme court that each owner of land overlying the same general underground supply of water may take such water on his own land for any beneficial use thereon so long as such taking works no unreasonable injury to other land overlying such water. If the natural supply is not sufficient for all such owners, each is entitled to his reasonable proportion of the whole and each may apply to the courts to restrain an unreasonable taking by another and have the respective rights adjudicated and the use regulated so as to prevent unnecessary injury and restrict each to his reasonable share. It is probably the case that your well is down lower than your neighbor's and your pumping has lowered the water level. But that does not mean that your use is at all unreasonable, as it might be as reasonable to say that your neighbor should deepen his well. Under the above statement of the court it apparently would be that you each be entitled to receive from this underground water your proportionate amount. What this amount would be is of course a very difficult matter to determine.

# Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

### Indigestion

My horses are eating up their mangers. They have plenty of good alfalfa hay before them most of the time and plenty of good water. They run in an alfalfa pasture all summer and had plenty of salt before them which they did not touch. When working they reach for every little tuft of grass or alfalfa after they have been well fed. What is the cause and what is the remedy?—Subscriber, Bakersfield.

Indigestion, caused by overfeeding. You must tie them so they can not gnaw the mangers. Feed them lightly in the morning and at noon and then give them a good feed at night that they can eat up in two hours, then tie them both ways so they can not reach the manger but can lie down. Get one ounce aloin, ten ounces turpentine and three pints raw linseed oil. Mix

THE AUTO-OILED AERMOTOR
A Real Self-Oiling Windmill

Oil an Aermotor once a year and it is always oiled. Every moving part is completely and fully oiled. A constant stream of oil flows on every bearing. The shafts run in oil. The double gears run in oil in a tightly enclosed gear case. Friction and wear are practically eliminated.

Any windmill which does not have the gears running in oil is only half oiled. A modern windmill, like a modern automobile, must have its gears enclosed and run in oil. Dry gears, exposed to dust, wear rapidly. Dry bearings and dry gears cause friction and loss of power. The Aermotor pumps in the lightest breeze because it is correctly designed and well oiled. To get everlasting windmill satisfaction, buy the Aermotor.

A year's supply of oil is sent with every Aermotor

thoroughly and divide into four doses. Give each horse one dose as a drench and repeat it in two days. Also get these powders: Six ounces powdered gentian, three ounces powdered nux vomica, four ounces bicarbonate of soda and one pound cornmeal. Mix all together and give a tablespoon of it in the feed twice a day.

### Feeding Baby Lambs

Can you tell me of anything I can give baby lambs for scours? Also how to feed cow's milk? I lost quite a few last year.—Subscriber, Dixon.

Lambs are delicate creatures to doctor and should not be given much strong medicine. For scours give a little coffee with a few drops of paregoric in it. When feeding lambs cow's milk they should be fed often and the milk should be warm. If it does not seem to agree with them pasteurize it by heating it up to about 180 degrees Fahrenheit for 10 or 15 minutes. A few times the temperature might go up to the boiling point but do not feed them on boiled milk. Of course it must be cooled to animal heat before giving it to the lambs. A little coffee or a few drops of paregoric added to the milk would help. One or two drops of zenoleum added to the milk once a day will often stop bowel trouble. Do not continue giving any medicine very long.

### Milk Goat

I bought a goat last June that was just fresh and giving two quarts of milk a day. She was very thin so I fed her corn meal, bran and green alfalfa. She picked up a little but is going down again, only giving one quart of milk a day. Should she be bred again or is she lonesome and should have another goat for company?—Subscriber, Modesto.

The flow of milk of most all goats and cows decreases after four or five months milking. Only a few keep up a long time. Probably rolled oats would be better than the corn meal. Corn meal is fattening and will make the milk rich in fat but will not increase the quantity. It would be well to breed her now so she would come fresh early in the spring and get the benefit of the early grass. She will probably do better next time if she is in better flesh.

### RECORD OUTPUT OF "GAS"

The greatest production of gasoline in the history of the oil industry occurred in May of this year, according to data compiled by the American Petroleum Institute and submitted to the senate committee on manufactures which is investigating the industry.

The output was 12,229,975 barrels of 42 gallons each. The highest previous production was in September, 1920, when 10,806,693 barrels were produced.

In spite of the unprecedented production, however, the amount of gasoline available in refinery storage on May 1 of this year was only 82 gallons for each of the 10,500,000 automobiles registered on January 1, as against an average of 87 gallons for each of the automobiles registered for the years 1918 to 1921.

Although the demand for gasoline varies more than 100 per cent between seasons of maximum and minimum consumption, it is necessary for the oil refineries to operate on practically a uniform basis throughout the year. Otherwise it would be impossible for the industry to accumulate sufficient stock to meet the peak demand.

Lime in a spray of paris green will prevent any burning of the foliage of plants.

Give the stock plenty of clean, cold water on these hot summer days.

### PRACTICAL COURSES ON AGRICULTURE

Six weeks courses in practical California agriculture spell opportunity for the busy man or woman who can spend the period from October 2 to November 10 at the branch of the college of agriculture at Davis. For those interested in the broader problems of soils, farm crops and livestock a course in general agriculture will be given. The first three weeks is devoted to crop production, followed by three weeks of highly practical instruction in animal husbandry.

For the poultryman six weeks of intensive study and practice began at Davis on October 2. Hatching, brooding, feeding and care of fowls receive all due attention, but in addition such work as the making of trap nests, feed hoppers and fattening crates is also included. Each student will be given an incubator to overhaul and operate for a period prior to the actual setting of eggs.

The total expense incident to attending a six weeks course, including board, room, supplies and the registration fee of two dollars, will not ordinarily exceed ninety dollars, exclusive of railroad fare.

### INTERSTERILITY OF PLUMS

Though some of the Japanese plums are self sterile, no difficulty has been experienced in cross pollination between any two in bloom at the same time. But experiments for the past two years seem to assure the intersterility of the Formosa and the Gaviota. It is thought to be the first case on record of intersterility of varieties springing from the same species. There is no known intersterility between any two other Japanese plums or between any of the European plums and prunes.

Mildew on roses may be kept in check by spraying with one half ounce sulphate potassium to a gallon of water.

When flowering plants are forming their buds is a good time to apply fertilizer and, if the season is dry, water also.

### A DANGEROUS WEED

The state department of agriculture has repeatedly called attention to the rapid spread of a most undesirable weed, Tribulus terrestis, the common name being "Ground Bur-nut." Owners of automobiles call it puncture weed because the ripened seed pods adhere to tires and if not cleaned off will finally puncture the tube.

It is thought it came to California from the Mediterranean region and is regarded as being native there, but it is found in warm countries throughout the world. In South Africa it has been common for many years, nearly or quite a half century. It has been definitely proved by government veterinary experts to produce the fatal disease in sheep known as Tribulosis ovium and by the native name of "geeldikkop," a disease first officially reported in 1886. As the weed is making a rapid spread throughout California, sheep owners should be careful that animals do not feed on it exclusively. In late summer, on sandy lands it is the greenest plant to be seen.

### TOO FRIENDLY

By Edgar A. Guest

He never caused a man to sneer,
Was never taunted by a jeer,
Had never battled with a foe;
But through the years that come and go
He smiled his easy way along
And played the friend to right or wrong.

He never ventured night or day
Out of the well worn trodden way
He never pried adventure's lid,
He voted as his father did;
But when an argument arose
He sided both with friends and foes.
He talked as one who loved the right,
But he was never known to fight;
Fearing the hate of men, he stayed,
Holding opinions but afraid
To give them voice. In moments tense
His silence gave no man offense.

Pleasant his smile and meek his way,
The same tomorrow as today,
Living this life, its joy and smart,
Yet shirking duty's sterner part;
A friend to all he walked along,
But friendly both to right and wrong.

Who never braves the cynic's sneer,
Nor wins the sinful braggart's jeer,
But seeks through life's long years to go
Free from the malice of a foe,
Buries his talents in the earth
With nothing done to prove his worth.

Better to fight and fall than stay
Upon life's sidelines day by day;
Better the jeers than smiles of those
Who should be looked upon as foes,
For friendships has no value when
It makes no choice twixt knaves and men.

### THE FOOL

By Smith C. McGregor, in Forward

He was just the fiddlin' Fool of Cleartrack Gulch. None of the other inhabitants of the gulch regarded him with any emotion, unless the shrieking wail of his fiddle bothered them, and the Fool seemed content to center his existence about that badly battered instrument. Only from dint of hunger, did he occasionally pause to wash enough gold to buy the few necessaries that his mode of living required.

The rough cabins of the miners were clustered on a level spot on the side of the gulch, a location that was extremely convenient for those who delved in the golden sands that were forever sifting down with the swift current. The Fool had erected a rude hut on the slope above the cabins, close by a towering rock covered with a profusion of wild grapevines. Perhaps one reason he chose such a location was that he liked to sit by the vine-clad rock and fiddle for hours at a time.

The hum of the rushing stream failed to drown the sound of the Fool's fiddle, and a group of miners at the edge of the stream glanced up toward the vine-covered rock. Yes, the Fool was there, leaning against the sunny side of the rock, fiddling away with utter abandon.

One of the miners, a hulking, gorilla-like man, straightened up and glared at the distant fiddler. Then he ran a huge hand through his thatch of uncombed hair and turned back to his work with a sullen growl.

"The Fool's fiddlin'."

"Yes, Red," agreed one of the group, with the ready obedience the timid weak afford the brutal strong, "the Fool's fiddlin.' "

The shrill sound of the Fool's fiddle ceased. A shower of pebbles bounded from the overhanging bank and dropped into the water near the miners. The water had suddenly become muddy, and Red Moran wiped a splash of mud from the corner of his right eye before turning his angry gaze in the direction of the Fool, who now stood on the bank above them, his old fiddle tucked under one arm, the warped bow dangling from his skinny hand. The fiddler had acquired that pose from long observation of a cheap print of Ole Bull that was taked on the wall of his hut.

"I've stopped fiddlin'," said the Fool.

"Yes, Fool," growled Red Moran, "and if you splash any more mud on on me, it'll be a long rest you'll have."

"The water's muddy!" exclaimed the Fool, peering down over the bank with perplexed amazement. Then his face relaxed into a grin, and he laughed. "D'ye know why it's muddy, Red?"

"Yes, because there's mud in it."

The Fool laughed, in imitation of the men in the stream below, and sat down on the edge of the stream. Another shower of pebbles dropped into the water, which was becoming clear again. The Fool noticed the change in the stream and called to the men below.

"Some dirt slid in up there in the gulch where the pines hang over the deep hole. That's why it was muddy."

There was no reply from below, except a few muttered oaths. The Fool glanced across the gulch, where a lone kingfisher was watching the men in the stream from the security of a scraggly pine. Then he called again to the men by the gravel bar.

"Better cut the pines up there. If they fall in and jam, the cabins might get washed out."

Then the Fool suddenly remembered his fiddle, and his face glowed with happiness as he lifted the warped bow and began to scrape it across the discordant strings. The big man below straightened up and flung a pebble.

The crash of the pebble against the fragile fiddle was followed by the shrill yell of the excited Fool.

"You've broke it! My fiddle!"

"Shut up!" mellowed the man in the stream, as though the power of his voice could awe the Fool into silence.

"Tell him it ain't busted, Red," advised one of the group beside him.

The Fool continued to wail over his loss, his hysterical screams echoing back against the slope like the calls of eagles soring above their pillaged nests. The voice of his tormentor again bellowed up from the gravel bar.

"Quit snivelin,' Fool! Fiddles improve every time they're busted."

"But Red," faintly protested the Fool, adding emphasis by a few weird sounds from the broken fiddle, "it don't sound any better than it did before."

"Fool, you can't expect that fiddle to be any good until the old tunes are boiled out of it," answered the man by the gravel bar, going back to his panning operations.

The Fool scrambled to his feet, still clinging to the broken instrument, and turned up the slope.

"I'm hungry. I can't fiddle any more today."

The Fool slowly climbed toward his hut, stumbling across a few fissures where the soil had started sliding toward the bottom of the gulch.

The next morning a heavy fog lay over the gulch. Occasional gusts of rain swept over the bare ridge above the cabins, harbingers of the storm that was long overdue. Then, after a few rumbles of distant thunder had died away, the sun broke through the clouds, making the air more oppressive than before.

The miners filed down to the gravel bar. The water was partially discolored, and the Fool's warning recurred to those who appreciated the power of the rushing stream. One man pointed up the gulch toward the group of leaning pines by the deep hole.

"Red, mebbe th' Fool was right about th' dirt slidin' in. It wouldn't take long to go and find out."

"You make me sick!" grunted Red. "That Swede Fool don't know what he's talking about!"

"All right, Red," yielded the uneasy miner, turning back to his work after another glance up the gulch.

"Anybody see the Fool this morning?" demanded the big man, glancing up toward the hut by the vine covered rock. "Why, he's cooking something in his kettle!"

Yes, the Fool was busy heating water in a huge iron kettle, a few yards from the rock. He had, by much early work, accumulated a pile of branches, and now he was feeding them to the bright blaze under the swaying kettle. Red Moran bellowed a sharp order.

"Davis, go up and see what the Fool's got in that kettle!"

The young miner hastened to obey, and was soon scrambling up the incline toward the Fool, who, if his wild screams were any index to his emotions, now seemed to be in a state of mental anguish. Something in his shrieks seemed to affect the men by the gravel bar, for they talked in subdued tones, never once taking their eyes from the Fool, who had flung himself down by the rock and was rolling about in frantic grief. The messenger came running down the slope.

"The Fool's been trying to boil the old tunes out of his fiddle, Red."

"What?" roared the bully, shaking with mirth. "He's spoiled his fiddle, you say?"

"Yes," Davis answered, rather crisply. "It was all he had, too."

"That's better than the time he cooked the owl," roared the big man. Then his voice grew harsh. "Why don't you laugh?"

"I won't laugh at the Fool's misfortune."

"Oh, you won't eh?" growled Moran, advancing along the bar. "I've a mind to souse you for an hour or so."

"Don't start a fight, Red," counseled another miner, "it's going to rain in a few days and we can't lose time. The Fool can make another fiddle."

The Fool did start another fiddle. That very afternoon he sought out Red Moran and inquired for glue to use in making his fiddle.

"You see, Red," explained the Fool, "I didn't take the fiddle out of the water soon enough. I want some glue to put a new one together. The old tunes won't bother now, will they?"

"They hadn't ought to, Fool," advised the bully, a new scheme for torment gradually forming in his slow-moving brain. "But I wouldn't use glue. Nails hold better."

"They spoil the tone," protested the Fool.

"It don't make any difference, for a good player like you," said Moran. "Anyway, you try some packing box boards and these nails. It'll be a great fiddle."

The Fool took the nails and eagerly sought the privacy of his hut.

A miner, after listening to the sounds of pounding within the hut, spoke to the bully.

"Red, we'd better watch th' Fool."

"Why?"

"He may hang himself. He's made a rope and noose of grapevines, and now he's poundin' on somethin'. Might be fixin' a coffin."

The bully suppressed a grin. "It wouldn't make much difference."

Large drops of rain cut short their conversation, and both men hurriedly sought shelter in their respective cabins. The storm was at hand.

Lights soon appeared in the cabins, for the storm brought with it an inky blackness, each flash of lightning intensifying the darkness rather than alleviating it. Even the Fool's hut was dimly illuminated by a rude contrivance that burned bark dipped in pitch. The stream, swollen to unusual volume by the cloudburst, roared like some wild monster of the towering mountains as it flung its force against the confining banks of the gulch, and even the sturdiest of the miners shuddered at the sound. It was too much like the agonized cry of the Fool when he had spoiled his fiddle.

One by one the lights flickered out, and by midnight only the dim glow in the Fool's hut gave sign that the gulch was inhabited by any living thing. The rain had suddenly ceased, but the roar of the stream continued, and the Fool at times paused in his task to listen. Once, as he was nodding into slumber, a strange sound aroused him; then the Fool slept.

The eastern sky was just beginning to tint when the Fool, his rude, unfinished fiddle clutched in one hand, dashed down the slippery slope toward the cabins. Fear added speed to his ungainly legs, and his voice shrilled

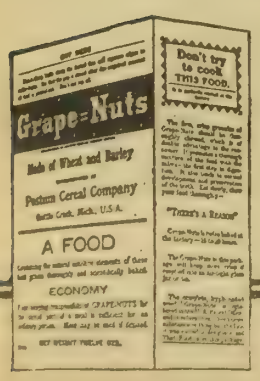
The one way to keep sound, perfect teeth

THE only way to keep the priceless blessing of sound, perfect teeth is to eat the kind of food that supplies them not only with proper nourishment but gives them work to do. Grape-Nuts not only induces thorough mastication, but also supplies the lime and other elements required for building firm tooth structure.

This wholesome, healthful cereal food is made from whole wheat flour and malted barley. All the nutriment of these splendid grains, including the vital mineral elements so often lacking in so-called "refined" foods, is retained.

A delicious, appetizing dish, Grape-Nuts, with cream or good milk, provides complete nourishment for body, bone and nerves, in readily digestible form.

Sold by Grocers Everywhere!



*"There's a Reason"* for **Grape-Nuts** —THE BODY BUILDER

Made by Postum Cereal Co., Inc., Battle Creek, Mich.

its warning again and again, starting a kingfisher from the scraggly pine across the gulch, which now leaned far out over the stream.

"The jam! The jam! Get up the bank!"

There was wild confusion inside the cabins as planks were ripped from caches of the precious gold, curses mingling with prayers that the jam would not break until they were safe from the reach of the stream. From every door, save one, men dashed in the wild panic that only intense fear can create. But Red Moran did not rush up the bank with the others; he stood in his cabin door and cursed the Fool until he could no longer see him, then slammed the door, as if defying the stream to do its worst.

The Gulch was strangely quiet. The air, damp and chill, seemed oppressive. The Fool stood near his hut, apart from the awe-struck miners, and listened. A mere trickle of a stream was flowing through the golden sands now, and only the Fool had detected the change that followed the crash of the leaning pines up the gulch, their tangled branches having provided ample reinforcement for the masses of earth that plunged after them. The Fool brought his warped bow from the hut and sat down on his coil of grapevines.

Like the sullen rumble of distant thunder, a deep roar was heard up the Gulch. The men shuddered. The Fool pressed his rude fiddle closer and spoke the thought that was uppermost in their minds, yet they feared to say it.

"The jam's broke!"

The door of the one occupied cabin below was thrust open, and Red Moran stepped outside. Suddenly, as if confronted by an unbearable horror, he gave a wild cry and started up the slope, carrying his sack of gold. The wet soil above the cabin was slowly sliding down toward the frantic man.

Up the gulch another fearsome sight came into view. It was the towering wall of water that had broken its bonds. The man on the slope, who was making painfully slow progress in the sticky mass, resolutely turned his glance from this new menace and redoubled his efforts to gain solid ground. He flung down the heavy sack of gold, and the moving earth engulfed it; the roar of the water now drowned out every other sound. A few yards below the muddy torrent swept, snatching up the cabins as if they had been so many straws, and struck against the cliff beyond the gravel bar with an impact that made the leaning pine shake violently.

Moran, sensing that the crisis was at hand, strained ahead, his muscles standing out till they threatened to burst the skin, his teeth firmly gripped in his bleeding lips, while the miners on the slope above stared down at him in mute helplessness.

The scraggly pine trembled again, then pitched out into the stream, followed by a mass of earth that caused the torrent to swirl up toward the man at alarming speed. Moran leaped forward, spurred on by this new menace, and gained the edge of the firm ground, while an adventurous comrade ran down to catch his hand; then he slipped and was carried back beyond reach. Nearer, nearer swirled the water, like a giant octopus reaching for a victim caught in a coral crevice, and Moran screamed in fear, while the men shuddered.

"He's done for," Davis said huskily.

The Fool did not seem to hear. He had dropped his precious bow in the mud and had fastened the unfinished violin to one end of the grapevine rope. Now he started down the slope, trailing the rope behind him; Davis cried out to him in undisguished amazement.

"Are you going to try to save him, after all he's done to you?"

"He might drown in that water," the Fool said simply, preparing to throw the line.

A cry surged over the men, and they rushed to carry out the plan the Fool had conceived, pushing him aside as they flung the vine to Moran, who lunged for it with fearful eagerness. The water was now swirling about him, well above his waist, and he floundered about in agony as he sought to break away from the mud that kept pulling him down. Blood spurted from his fingers as he clutched the rough fiddle and was slowly dragged from the water; then he dropped to the ground, insensible.

The stream, seeming to sense the loss of its victim, sullenly broke through the barrier of earth and rumbled on down the Gulch.

Red Moran, for a long time after he had regained his senses, stood near the Fool's hut and looked down into the gulch. A slender object lay in the mud at his feet, and he picked it up, wiping the dirt from it with clumsy hands. It was the Fool's bow, warped and ruined; sound from the interior of the hut gave token that the Fool was lamenting the loss of his unfinished fiddle, and a strange mist wavered before Red Moran's eyes as he again looked down into the desolation of the gulch.

"I reckon I'll buy the Fool another fiddle," he said.

## POINTERS ON WHIPPING CREAM

Pasteurized cream will whip as well as raw cream if its butterfat content is slightly higher. A 20 per cent raw cream is nearly equal to a 25 per cent homogenized cream in whipping quality. It takes less time to whip raw cream than pasteurized.

To insure good results the temperature of the cream should not exceed 45° F. Increasing the acidity up to 0.3 per cent, when the cream acquires a sour taste, does not affect the whipping quality, but adding sugar at any time during the whipping tends to thin the whip. Flavoring extract in ordinary quantities has no detrimental effect.

Whipped cream will stand up, or remain stiff, for some time if the temperature, the quality of the whip, and the butterfat content are right.

Powdered cream is useless for whipping purposes. Evaporated milk will whip, but it will not stand up. In the same time it took to thicken, the cream will return to its original form.

## HOUSEHOLD QUERIES

### Olives—Green Tomato Pickle

Am still watching for recipe for putting up olives. I want to pickle some for my own use. Please give as soon as convenient, recipe for green tomato pickles.—Subscriber, Claremont.

A number of good recipes for green tomato pickles have been given in the past few weeks in this department. References to pages and issues will be found on Page 370 of last week's Cultivator under heading "Recipes Requested." Directions for pickling both ripe and green olives follow. They are given by Prof. W. V. Cruess.

Ripe Olives. Use firm ripe olives of the Mission or the Manzanillo varieties. Place these in a wooden bucket or a glass or stoneware jar or crock. Do not use metal.

Prepare a lye solution containing two ounces of lye to a gallon of water, or approximately one-half pound to five gallons of water. Use a good grade of lye, such as Red Seal or Babbitt's. Thoroughly dissolve the lye in the water before adding the solution to the olives.

Cover the olives with this solution. Stir the olives once an hour and allow the lye to remain on them until it has penetrated the skin of all the olives, but has not entered the flesh of the olives more than one-sixteenth of an inch. The fruit may be cut with a knife from time to time to note the progress of the action of the lye. the flesh will be discolored, that is, turned yellowish brown, by the action of the lye. It ordinarily requires about four hours for this action to proceed far enough.

Remove the lye solution but do not discard it. Expose the olives to the air in the vessel in which they have been treated, stir them three times a day and leave until jet black in color, usually about four days.

Return lye solution to the olives and allow it to stand until it reaches the pit of the olives. This will usually be about 18 hours. If it is found that the lye does not reach the pits of the olives it should be drained off and to each gallon of the liquid one-half

# The Saving Paint

**Developed Through 73 Years' Experience**

## It Brings Extra Years of Wear

THE paint that will save you the most money over a period of years is the best paint you can buy.

Except for the least important item—first cost—it is less expensive in every way.

We say that first cost is least important, because it costs more to apply the paint on your buildings, etc., than it does to buy the paint.

The best paint saves in two ways, it spreads easily—saves time—and it covers more area per gallon—saves material.

But the biggest saving is found by figuring the cost per year of a paint job. The best paint serves five or more years longer than "cheap" paint.

The best paints are scientific in formula and preparation. We've made them for 73 years—to meet the weather conditions in the West.

The best materials—PIONEER WHITE LEAD—pure linseed oil, pure zinc and pure colors—are combined in Fuller's House Paints in scientifically exact proportions with long-time skill.

**House Paint:** Fuller's Pure Prepared Paint, Phoenix Pure Paint, for painting houses. The purest, best protective and most durable paint manufactured —32 colors.

**Barn and Roof Paint:** A protective coating for barns, roofs, fences. Dries with a good gloss and wears. Economical in cost and dependable in quality —6 colors.

**Floor Paint:** Fuller's Rubber Cement Floor Paint—a sanitary, waterproof and durable paint for floors of kitchens, closets, etc. Attractive in color and gloss. Dries hard over night—12 colors.

**Porch and Step Paint:** A durable paint for use on porches, steps and other wood work exposed to the elements and subject to considerable wear. Six colors from which to choose.

Also makers of Fullerwear, an all-purpose Varnish, Silkenwhite Enamel, Fifteen-for-Floors Varnish, Decoret, Washable Wall Finish, Auto Enamel, Fuller's Hot Water Wall Finish (kalsomine), Porch and Step Paint, Silo Paint, Milk Can Enamel, PIONEER WHITE LEAD, Tractor Paint, and Fuller's Oil Stains.

**Advice on Painting FREE**

If you want to do your own work and get the best results, ask our Specification Department for *free advice.*

We'll tell you how to treat old paint, how many coats to use, what kind of brush, etc.

Use *Fuller Service* as well as Fuller Paints and Varnishes to insure good work.

**PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH**

**HOW TO ORDER PATTERNS**

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cent) stamps for each number. In order to furnish our readers with the very best NEW YORK styles, all patterns ordered are filled in NEW YORK. Do not expect patterns under Two Weeks from date of order.

PATTERN DEPARTMENT
California Cultivator Los Angeles

ounce of fresh lye should be added, or about one-fourth pound to five gallons.

When the lye has reached the pits of the olives remove it and discard it. Cover the olives with fresh water which should be changed three times a day until the olives are free from any taste of lye, usually a week.

Prepare a brine of one-quarter pound of salt to a gallon of water, allow the olives to stand in this about three days. They are then ready for use or for sterilizing.

Place the olives in jars or cans and add boiling hot to them, the brine in which they have been standing. If cans are used seal them at once; if jars are used place on them the scalded caps and the best rubbers obtainable—cheap rubbers cannot be used. Screw the caps on the jars loosely. Place the jars or cans in a pressure cooker and heat to ten pounds pressure for 40 minutes. Turn out the fire and allow the retort to drop to zero pounds pressure. Remove the jars while still hot and seal at once.

If a pressure cooker is not available sterilize the olives in the jars or cans in a wash boiler for two hours at the boiling point and then seal them. In this latter case, however, it is necessary to boil the olives for 20 minutes after the jar or can is opened for serving. Olives sterilized in boiling water cannot be offered for sale.

Green Olives. Use olives that have reached full size but are still hard and green.

Prepare a lye solution of one and one-half ounces per gallon of water or approximately one pound of lye to ten gallons. Use granulated lye such as Red Seal or Babbitts.

Place the olives in this solution and allow to stand until the lye reaches within a very short distance of the pit. Stir the olives frequently during this treatment.

Remove the lye solution and cover the olives with fresh water. Change the water daily until the taste of lye is removed and until most of the bitterness has been washed out of the olives. This will require about seven days.

Place the olives in a barrel or in ordinary fruit jars and cover with a brine consisting of half a pound of salt to a gallon of water. Fill the barrel or fruit jar full and seal.

Set aside until the proper flavor has developed, usually about five or six months.

Fermentation is improved if to the brine is added a small amount of good vinegar; about half a pint per gallon of brine.

### Candied Citron—Dill Pickles

How can I make candied citron like we buy in the stores? Please send recipe for dill pickles.—Subscriber, Lakeport.

Directions for making candied citron were given on Page 330 of the Cultivator of March 25; for dill pickles, on Page 133, issue of August 5. Copies have been mailed Lakeport subscriber.

The Cultivator is always glad to mail back copies answering special questions, but the large number of such requests received emphasizes the value of saving and filing in order every issue of the Cultivator. Then by use of the index one may find wanted directions in a few moment instead of waiting on slow mails and a busy office force.

### Ginger Snaps—Catsup—Canned Figs

Will you please furnish me with a recipe for ginger snaps, the kind sold in grocery stores; also a recipe for tomato catsup that will not sour quickly and canned figs?—Subscriber, Marysville.

Ginger Snaps—One cup molasses, ¼ to ½ cup butter, suet or chicken fat, 2 teaspoons salt, 3 cups flour, ½ teaspoon soda, 1 tablespoon ginger. Boil shortening and molasses 2 minutes. Add remaining ingredients, mixed and sifted. Beat well; chill over night. Roll very thin. Shape with knife or cutter. Bake on buttered pan in quick oven 8 to 10 minutes.

Directions for making tomato catcup are given on Page 85 of the Cultivator of July 22.

Where figs are simply to be canned firm ripe fruit is chosen, skinned and canned in sweet syrup like peaches. A piece of ginger root is placed in each can or jar by those who find the fig insipid; some add a slice or two of lemon. If subscriber wishes recipes for preserves, candied figs, etc. we will send on request recent issues of Cultivator containing them.

### Pimientos—Apple Sauce Cake

In a recent copy of the Cultivator there was a recipe for putting up pimientos. I have misplaced mine so I will be obliged to you if you will send me the recipe in enclosed stamped envelope.

Here is a recipe for an apple sauce cake that we like very much: One cup sugar, ½ cup shortening, 2 cups flour, 1 cup sour apple sauce, 1 teaspoon soda, ½ teaspoon each of cloves, cinnamon, nutmeg, pinch of salt. Cream sugar and shortening, put sode in apple sauce, and then add to sugar and stir well. Sift flour and spices together and then add raisins. Nuts may also be used. Bake in a slow oven about an hour.—A Reader, Cupertino.

Pimiento recipe has been mailed. Thank you for passing along the apple sauce cake recipe.

## HINTS FROM HOUSEKEEPERS

### Tomato Mincemeat—Chocolate Cake

In the September 9 issue of Cultivator I noticed a request for green tomato mincemeat so am sending my recipe which is the best ever. It is different from any I have seen in print. Am also enclosing my recipe for loaf chocolate cake.

Tomato Mincemeat—Eight quarts green tomatoes chopped fine. Drain off juice, pour over enough boiling water to cover and drain again. Then pour on boiling water the second time and cook till tender. Drain this off and then add the following: 5 pounds sugar, 2 pounds raisins, ½ pound currants, 1 cup suet (chopped fine), 1 cup vinegar, 2 tablespoons cinnamon, 1 tablespoon cloves, 1 tablespoon nutmeg, 1 tablespoon salt. Cook till well mixed, stir constantly. Put in cans and seal while hot.

Chocolate Loaf Cake—Pour ½ cup boiling water over 2 squares Bakers unsweetened chocolate. Place over top of teakettle and let stand while mixing the following ingredients: 2 cups sugar and scant ½ cup shortening creamed together. Add two unbeaten eggs, ½ cup thick sour milk, 2 full cups flour, 1½ teaspoons soda, 1 teaspoon vanilla, pinch salt. Beat thoroughly, then add chocolate and hot water. Bake in moderate oven.—Mrs. F. J. Bohlayer, Canton, Pennsylvania.

### Tile Drainboard

Noticed in Cultivator of September 16, "Subscriber, El Monte," asks about tile drainboards. Have used tile drainboard and work table for nearly three years. It is fine. I scrub it every month or two with Dutch Cleanser and find it very easy to keep clean; and I never have broken a dish on mine. I always use a dish drainer, (could not do without one). The only other drainboard I would have would be a porcelain one like the sink. My tile has never cracked and the cement is not dirty.—(Del Monte) Fowler.

**Oil Light Beats Electric or Gas**

**BURNS 94% AIR**

A new oil lamp that gives an amazingly brilliant, soft, white light, even better than gas or electricity, has been tested by the U. S. government and 35 leading universities and found to be superior to 10 ordinary oil lamps. It burns without odor, smoke or noise—no pumping up, is simple, clean, safe. Burns 94% air and 6% common kerosene (coal oil).

The inventor, W. V. Johnson, 31 N. Fifth St., Portland, Ore., is offering to send a lamp on 10 days' FREE trial, or even to give one FREE to the first user in each locality who will help him introduce it. Write him today for full particulars. Also ask him to explain how you can get the agency, and without experience or money make $250 to $500 per month.

**KILL ANTS The Marvel Way**

**Doom to the Worst Pest**

Each ant upon your premises is there with your full permission. With the aid of Marvel Ant Exterminator you can rid your premises of every trace of ants. This is the only Exterminator that is carried to the ants' nests by the workers. It kills the queens and males. It is a GELATINE that will not deteriorate. You set a can on each trail of the ants. Kept sealed; the ants crawl through portholes to devour the poison. I guarantee results. 60c per can; 6 cans $3.00. Literature free.
